The total production of creamery butter in 1917 was 87,404,366 lbs. value $34,277,188, as compared with 82,564,130 lbs. value $26,966,355 in 1916 and 83,991,453 lbs. value $24,385,052 in 1915. Quebec and Ontario together produce 72 p. c. of the total creamery butter in Canada. The production of Quebec in 1917 was 34,392,560 lbs., value $13,689,310, as compared with 34,323,275 lbs., value $11,516,148 in 1916 and 36,621,491 lbs., value $10,899,810 in 1915. Ontario in 1917 produced 28,714,352 lbs., value $11,219,029 as compared with 24,680,109 lbs., value $8,031,997 in 1916 and 26,414,120 lbs., value $7,534,653 in 1915. For all Canada the average wholesale price of creamery butter works out to 39 cents per lb., as compared with 33 cents in 1916 and 30 cents in 1915. By provinces, the price for 1917 is highest in British Columbia 46 cents, the prices in the remaining provinces ranging as follows: New Brunswick and Nova Scotia, 41 cents; Prince Edward Island 40 cents; Quebec 40 cents; Ontario 39 cents; Manitoba and Saskatchewan 37 cents and Alberta 38 cents.

Production and Value of Factory Cheese

The total production of factory cheese in 1917 was 19,904,336 lbs., value $41,170,563, as compared with 192,968,597 lbs., value $35,512,622 in 1916 and 193,887,837 lbs., value $27,097,176 in 1915. Ontario and Quebec together produce 97 p. c. of the total factory-made cheese in Canada. In Ontario the quantity produced in 1917 was 121,173,086 lbs., value $25,771,944, as compared with 126,015,570 lbs., value $23,312,935 in 1916 and 125,001,136 lbs., value $18,831,413 in 1915. The average wholesale price of factory-made

MORE MILK & BUTTER
HAS NO EQUAL AS A MILK AND BUTTER PRODUCER
Milch cows need food rich in nitrogen for two reasons, to rebuild the ordinary waste of tissue and to secure the protein necessary for the milk. This is why nothnig can equal "Maple Leaf" Oil Cake as a Producer of butter and milk. It increases the flow of milk and adds to the richness of the cream. Made by the old process and guaranteed absolutely pure. Contains over 35% Protein and 33% Carbo Hydrates. This splendid food is so rich in protein that British Farmers send four thousand miles to secure it.
Write to-day for samples and our free booklet "Facts to Feed."

FERTILIZERS FOR 1919

We Supply Fertilizers for Every Crop and for Every Soil

Making two blades grow where only one grew before. By using Shur-Gain Fertilizers, you can increase your yields without additional land, labor, or seed.

For information and prices

Gunns LIMITED ST. JOHN, N.B.

We would suggest the importance of an early order—it will give you the benefit of present prices and insure delivery.

Potato growers have denomstrated that commercial fertilizers scientifically used will yield a splendid profit.

We have just the grade that you require for your soil and can give you much valuable information.

We specialize on potato fertilizers and can fill your wants at prices that are worth investigating.

GUNNS LIMITED, 676 Main St., St. John, N. B.

WIFE'S COLD

Husband's Bronchitis

CURED BY

DR. WOOD'S

NORWAY PINE SYRUP.

Mrs. James Mack, Trenton, Ont., writes:—"I suffered for several months with a bad cold. Some friends told me about Dr. Wood's Norway Pine Syrup, and of the benefit it was to them. Before I had used two bottles I could get some rest, which I could not do before. I had tried everything, but "Dr. Wood's" was the only thing that gave me any relief.

My husband suffered terribly from bronchitis, and did not know whether he was going to recover or not. At my druggist's, Mr. J. H. Dickey, I was advised to try your syrup, which I did, and am so thankful that I cannot recommend it highly enough."

Many people on the first sign of the slight cold or cough neglect it, thinking, perhaps, it will disappear in a day or two, but the longer it is let run the worse it gets until it settles on the lungs and serious results ensue.

On the first sign of a cough or cold, get rid of it before it gets settled. Take a few doses of Dr. Wood's Norway Pine Syrup and see how quickly it will disappear.

This sterling remedy has been on the market for the past 30 years, and stands head and shoulders over all other cough remedies.

Put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

cheese for Canada was for 1917 21 cents per lb., as compared with 18 cents in 1916, and 15 cents in 1915. For 1917 the highest price per lb. was in British Columbia 30 cents, and in the other provinces the average price was close to 20 or 21 cents per lb.

Other Data

The total value of the capital invested in the creameries and cheese factories of aCnada in 1917 was $19,628,000. The number of employees was 10,346 and their salaries and wages amounted to $5,446,446. The amount paid to patrons was $73,873,245 and the total expenditure, including fuel, $834,036, materials $3,844,698 and miscellaneous expenses $2,498,334, was $86,496,769. In addition to the value of the production of butter and cheese, other products were manufactured to the value of $18,424,485; so that the total value of the products of dairy factories in 1917 amounted to $93,822,236.

WINTER FEEDING OF DAIRY COWS

(Experimental Farms Note)

Cows are fed in the stable during one half of the year or more and feeding during this period may, through ignorance or on account of using unsuitable feeds, be made very expensive. The profits from the herd will of course, depend to a large extene on the economy of the methods of winter feeding followed.

Economical feeding does not mean svant supplies, but the using of the kinds of feeds and feed combinations that will be likely to produce the best results at th elowest cost.

As the milk produced depends upon the quantity and quality of the feed consumed, every effort should be made to supply the cow with all she will eat of a ration combining palatability, easy digestibility, variety and nutrition.

The most economilcal ration must have as a basis, cheap but rich nutritious, farm-grown roughages such as clover hay, ensilage and roots. The liberal feeding of meals is advisable to balance the roughage ration and to provide the heavy milking cow with an extra supply of nutrients in a less bulky form.

A pound of grain when the cow is fresh is equivalent to several pounds of grain after the cow has decreased materially in her milk flow. Feed one pound of meal for every 3½ pounds of milk produced; as her lactation periol progresses, decrease the meal gradually to one pound for every five pounds of milk produced.

The following are two well-balanced daily rations for the 1,000 pound dairy cow suitable to the individual needs of farmers throughout the district.—

No. 1.—Mixed hay 16 pounds, turnips or mangels 40 pounds, meal mixture composed of bran 6 parts, ground barley 2 parts, oil cake 1 part and cotton seed meal 1 part. This meal fed at the rate of 1 pound per 3½ pounds of milk produced.

No. 2.—Mixed clover hay 12 pounds corn ensilage 30 pounds, meal mixture composed of bran 5 parts, cotton seed 2 parts, oil cake 1 part, fed at the rate of 1 pound for every 3 or 3½ pounds of milk produced.

All cows are not of the same temperament. On this account a study should be made of the requirements of the individual animal. In the best-bred herds, cows vary in itheir productive ability, therefore to obtain the greatest profit, records should be kept of both milk and feed, and tests made occasionally to ascertain if it would pay to increase or decrease the grain.

Cows in order to make a mixmum production at a minimum cost, should be housed under the most favorable conditions, that is, in regard to cleanliness, good ventilation, plenty of light, with necessary bedding and occasional grooming.

A cow should have all the good quality roughage she wants, with a well balanced grain ration regulated by her production, also plenty of fresh water and from one t othree ounces of salt added to her feed daily.

THE AYRSHIRE COW

Sir:—

When reading this week's Scottish Faremr the thought occurred to me—While Friesians and Dairy Shorthorns are booming what are the Ayrshire Breeders doing? Is there any breed of dairy animals that for a given quantity of food can produce an equal quantity of milk? It may be that some breeds give more milk per head, but what of the annual cost in foodstuffs, and what of the quality of the product? It seems to me to be a matter of the first national importance to produce the best possible rather than a large quantity of poor milk. Of course as the law now is, it pays better to produce the greater quantity, hence the producer can pay more for his machine, i. e., the cow.

I understand there is a movement on foot to let the public know the qualities of the Ayrshire cow, and it is to be hoped that those breeders who in the past have received strong financial support will now come to the front and advertise cattle by facts which, I am confident, will compare favorably with if they do not surpass, other breeds. It is within the knowledge of many readers of the Scottish Farmer how the Ayrshire cow when combined with thrift and good management has made an independence for many. a living for some, and it was not the cow's fault if failure overtook any. The Ayrshire cow has also been a large contributor towards keeping the land in the south-west of Scotland up to its present state of fitness which has been of some assistance at this time, and should be remembered in the future I hope, with the Editor's permission, that this may inaugurate a series of letters on this subject, and bear useful fruit in bringing before that portion of our public who do not know that we do not need to go from our own door to get the most economic food produce in the animal world,

Yours,
AYRSHIRE BREEDER.

The above article taken from the "Scottish Farmer" of a recent issue, shows that the Ayrshire breeders in Scotland are not pushing their business as are the Friesian and Dairy Shorthorn men. There are several truisms in this letter as here again, we find the modesty of the Ayrshire Breeders displayed. For some reason or other they have not "boosted" their breed to the same extent as some of "Scottish aFrmer" of a recent issue, thinks they leave it too much to the Ayrshire cow to demonstrate her ability to produce largely and economically.

Ayrshire men, get busy and boost "Our Favorites.

W. F. S.

TOO LATE
Now is the time when you need a silo most. If you had installed a silo last season, right now your cows would be giving 25% more milk at a good deal lower feeding cost.
But it's too late now to worry about that. The best thing to do is to make sure now that you will not be without a silo next winter.
IT'S NOT TOO EARLY TO PLAN FOR YOUR NEW SILO
Send for our silo book. Tells all about silos, silage and silage feeding

FERTILIZERS IN CAR LOTS

The New Brunswick Agricultural Societies United offer unmixed fertilizers in car lots. The prices are the most reasonable on the market to-day. Write the secretary at Sussex, N. B.

FEEDS ARE SCARCE

Mill feeds are scarce. On account of the railway embargo, under which the forwarding of goods to tidewater for export, is prohibited, the flour mills of Canada have either closed down entirely or are operating only part time. The result is that bran and shorts are entirely off the list at the majority of mills, while others are only offering a few tons of bran and shorts, to the car. This condition will continue until Great Britain raises the ban against imports to that country, which at present has more food than she can care for. Then the millers are arranging to return to the manufacture of white flour. If this be done, it is claimed that either flour or feeds must go up. When the change was made in the United States, it was feed which soared and to-day it is selling ten dollars over the Canadian market. If mills are allowed to export their bye-products to the United States, prices will go up. At present there is a fair supply of feeds on this market, but the outlook is for scarcity and for much higher prices. Special feeds are being pushed by all mills.

The Maritime Farmer at the time of going to press offers number one feed oats at 95 cents per bushel delivered points in New Brunswick, and as far East as Halifax on main line of National Railways. Number twos are quoted 92 cents delivered. The oats are bagged and prices are subject to confirmation. Get your agricultural society to get the co-operative habit. Buy together in car lots.

THE PERIOD OF OESTRUM DURING WHICH TO BREED SOWS

(Experimenta Farms Note)

The period of oestrum or heat, in the sow appears in the neighborhood of twenty-one days, with the normal animal in good breeding condition. The sow remains in heat from one to five days. The effect of delaying the boar's services until the period of heat is almost over, has long been a subject for discussion with the hog-man. Such practice, it is claimed, invariably results in larger litters than would be the case were the sow bred during the first day. As a physiological explanation of the foregoing, it is claimed that during the latter part of the period a much larger number of ova are presented for fertilization by the male element, with the resultant increase in the size of the embryo litter.

With horses and cattle, the generally accepted practice, particularly with the former class of stock, is to delay breeding until the period is well advanced. Likelihood of conception would thereby seem to be increased, due, no doubt to the fact, that the female functions have had time to take place properly, that the female is usually more receptive to male attention and allowing a reasonable length of time to elapse after the usual advertisement of oestrum.

With the sow the same probability of conception by delayed breeding is heightened, for the foregoing reason. That a larger litter should be expected, is by no means so sure, the claims of many expert breeders to the contrary. The size, vigor, and numbers of the litter may be far more certainly controlled by the condition of the boar and sow at the time of breeding. Such, at least, would be indicated by the results noted from the large herd of brood sows kept at the Experimental Farm at Ottawa. Here, the general practice is to breed on the second day, using, where necessary, the breeding crate. During the winter of 1917-18, however, several groups of sows were bred, by allowing a boar tao run with each lot. Besides obviating much labor in hand-breeding reluctant individuals and reducing to a minimum the number of "missed sows"—the size and vigour of the resultant litters left little to be desired.

In brief, to the man who keeps only a few sows, and who makes use of a neighbournig boar, breed on the second day, deepnding, of course, on the sow's individual peculiarities. See that she is in rising condition—not fat not thin, but in fair flesh and gaining every day. If the sows have been on fall grass, use a little grain before breeding. If the sows have been irregular in heat, this will tend to bring them in for breeding regularly and within a few days of one another. Use judgment in breeding the weaned sow. If she is much run down from nursing her litter and bred in this condition a few days after weaning, a disappointing second litter will in most cases result.

If no boar is kept, try to select the services of one, not too heavily used, reasonably well fed and above all, well-exercised. The thin boar, or the over-fat individual, frequently are both getter of small litters, no matter when they serve the sow.

To the man who allows his boar to run with the sows, good results may be expected, even if the boar does not show much scientific knowldge, provided th herd is well-exercised, housed in dry quarters and sufficiently well fed to ensure gain in weight and provided further that the sow is removed, temporarily, from the group as soon as properly served. Emphasis, too, must not be neglected with reference to the desirable effect on breeding stock of green feed in summer, and succulent foods,—roots, clover, hay or ensilage in winter.

THE CARE OF THE FALL LITTER

(Experimental Farms Note.)

The measure of the swine feeder's ability may well be taken by his success in handling his late summer and fall litters. Here the percentage of culls and unthrifty pigs is usually high, particularly with the late fall litter obliged to winter in cold or worse damp quarters. Generally speaking, no young pigs should arrive after September, unless the feeder has exceptional facilities for winter swine raising.

To ensure strong fall litters the sows should spend the summer on pasture with as much range as possible. Clover, alfalfa, rape or grass may be utilized to the exclusion of meal for the first two months, provided the pasture is abundant. For the duration of the gestation or carrying period, the use of a little meal, once daily, will be amply repaid. Shorts and bran, equal parts, with a handful of oats per sow, fed a few pounds daily, is recommended.

One very fertile cause of unsatisfactory fall litters, is found where the sow has produced a litter in the spring, been heavily milked, and bred in a thin weakened state, and at the same time properly nourish the litter she is carrying. Ordinarily, breed the sow a few days after weaning. If she is much pulled down in flesh delay breeding even at the expense of a later fall litter.

When the sow farrows, if in August, September, or later, observe the following facts.—

1—See that the youngsters have exercise and plenty of it, right up to snowfall.

2—They must have a warm, dry place to sleep. One thorough chilling, such as may be contracted on a wet, cold fall evening, where improper shelter and little bedding are supplied, will ruin the sucker or weaner, for good and all. Given a dry floor, well bedded, the fall has no terrors for the little pig.

3—Start the pigs to eat when two or three weeks of age. If two or three sows farrow at nearly the same time and if they are acquainted, place them together with their litters. Make a hole in the fence and give the little ones the run of the barnyard or adjoining field or paddock. Provide a small self-feeder where the sows cannot reach it, and keep a mixture of shorts, 2 parts; ground corn, 1 part; ground oats, 2 parts;—before the little pigs at all times. Skim-milk in a trough, similarily situated, will also prove popular and highly beneficial.

4—Mangels or sugar beets fed tops and all will be relished by the sows, as well as a few cobs of corn daily. A meal slop containing if possible, milk in some form with a mixture of shorts, ground corn and ground oats should be fed twice daily. Feed for milk.

Winter Care of the Fall Pig

The winter quarters for the three or four months pigs must be dry above all things. A low sleeping berth built in an open shed covered over with straw and kept well bedded, with dry straw, provides comparative warmth, dryness and fresh air. Access during the day time to a shed in which they may root in straw or litter after a few handsful of oats or whole corn, is highly to be recommended. Either the self-feeder, or burough may be used to advantage. Ashes, sods, earth, etc., should be constantly accessible.

If any one feature should receive emphasis over all other in connection with the rearing of fall pigs, it is that of dry quarters.

FRANCE WANTS TO BUY

France at the end of the war finds herself with 2,360,000 less cattle, 2,258,000 less sheep, and 2,815,000 less pigs than in 1914. She will be glad to buy pork and hog products in Canada as soon as financial arrangements as to credit in Canada can be arranged. Canadian breeding cattle also are wanted. Canada is the only country upon whose cattle France does not maintain an embargo.

DENMARK'S BACON TRADE

Before the war Denmark used to send Great Britain 2,300,000 hundred weight of bacon per year. Today Denmark is herself short of 1,873,000 pigs. And her great hungry neighbor, Germany, is short 19,306,000 pigs. Britain will have to look elsewhere for the bacon Denmark used to supply, and here is where Canada will find a permanent trade opportunity with the mother country of no mean proportions.

How It Works Out Actual Practica Experience

In November, 1917, a customer bought

10 shares C.P.R.

In February, 1918, he increased his account by the purchase of an additional

5 shares C.P.R.

Since that time he has been paying against these purchases

$87.25 EVERY MONTH

During the period and including December, 1918, the Interest charges on his unpaid balance have totalled

$93.00

but this has been so far offset by the dividends which have been paid on the shares and credited to his account to a total of

$175.00

so that he has on interest account alone made a profit of

$82.00

It will take him seven months more to complete payment in full when the result of his

Systematic Investment

will be that he will own a certificate for

15 SHARES C.P.R.

which will return him an income of

$37.50 EVERY THREE MONTHS

Does this suggest anything to you?
Are you not a little anxious to study this plan?
Why can't you put one into operation for yourself?
Write or wire at our expense for folder M, study it, and apply this systematic saving to yourself, for yourself. It will PAY YOU IN DIVIDENDS.
Our one stipulation is that you select good securities; remember, you are investing, not SPECULATING.

WAS WEAK

ALL RUN DOWN

FROM HEART and NERVES.

Mrs. Percy G. McLaughlin, Lawrence Station, N.B., writes:—"I am writing to tell you that I have used Milburn's Heart and Nerve Pills, and find since I commenced to use them that I feel altogether a different woman. I was weak and run down from my heart and nerves, and was recommended to try your pills by Mr. James H. Scott who has taken them, and says if it were not for them he could not live. When I finish the box I am now taking I will be completely cured. I wish to thank you for putting up such a wonderful medicine, and I will gladly recommend it to one and all."

To all those who suffer in any way from their heart or nerves, Milburn's Heart and Nerve Pills will come as a great boon. They strengthen and stimulate the weak heart to pump pure, rich, red blood to all parts of the body, strengthen the shattered nerves, and bring a feeling of contentment over the whole body.

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

LIVE STOCK MEETING

Important Conference Held in Ottawa to prepare for Big Business.

Leading Live Stock Producers, including the members of the Canadian Live Stock Council and representatives of the Meat Packing industry of the Dominion, in conference at Ottawa as to the best means of meeting the situation presented by the enormous live stock shortage in Europe, drew up a memorandum to the Government in the form of five resolutions which include the following points:

That a policy of rural credit be sanctioned and supported by the Federal Government.

That tseps be taken to establish credits in this country with France, Belgium and Italy.

That a Government agent, preferably Mr. H. B. Thomson, Chairman of the Canada Food Board, in the continuation of his present capacity, be sent to Europe to secure fullest possible recognition of Canadian interests in supplying agricultural products.

That the Government provide necessary marketing facilities, including adequate controlled temperature space in railway cars, storage warehouses, and ocean going vessels.

That the Government give encouragement to a campaign throughout Canada for increased live stock production, in view of the enormous opportunities now presented to the Canadian live stock industry.

In his reply, Sir Thomas White, Acting Prime Minister, said many of these points were being provided for and whatever further possible would be done.

WATER FOR HOGS

William E. Purdue.

In order to make satisfactory gains hogs must have an abundance of pure drinking water at all times in addition to slops. The latter will never take the place of water. A number of water tanks or troughs should be placed in the hog lots. In warm weather water must be given four or five times a day, and therefore much labor can be saved if a tank or trough is arranged for water to run from the stock tank. The animals can then help themselves to a drink at will, and on warm days one or more will be at the trough nearly all the time. It has been claimed by a few authorities that the practice of keeping a supply of drinking water always available to growing pigs will add 20 to 30 pounds to each one's growth during the summer and fall.

From the standpoint of economy and general satisfaction the most practical hog trough is a metal concrete. Although the firts cost of wooden troughs is less than those of metal concrete, when it is remembered that the steel troughs last a lifetime with ordinary usage it will be seen that they are cheaper in the end. Especially in dry weather are the concrete metal troughs more satisfactory than the wooden ones. No wooden trough, no matter how well it may be constructed, can be used long until it will begin to leak in dry weather unless water is constantly running into it. Another advantage of the metal troughs is that they are easily kept in a sanitary condition. In purchasing metal troughs it is well to get different sizes and lengths. For five to ten hogs the two-foot trough with a bar across the top is the most convenient, being a very handy thing to carry from one place to another if necessary. A trough of this size is also generally used in the individual pens of the brood sows. For a bunch of shoats longer troughs are more convenient.

If wooden troughs are employed they should be constructed of well-seasoned boards. Inch boards, or even lighter, will do very well for small troughs. But the troughs from which heavy pigs are fed should preferably be made of one and one-half inch stuff. For the purpose of avoiding any waste of feed, and to give all the animals an equal chance to secure their share, there are a number of devices that any farmer with a hammer and saw, and some loose pieces of boards, can arrange on the troughs so that the greedy animals cannot get their feet into the slop or water. Cross bars extending across the top of the trough, limiting the feeding operations of each animal to one section, between the bars, is a very common way of fixing troughs to keep the animals' feet out of their food and drink. If an enclosed feeding floor is used, the troughs may be placed along both sides of the floor. This will give sufficient trough room for all the pigs at one time without crowding.

HOW TO FFED YOUNG PIGS

Feed, sunshine and exercise are the three essentials mentioned by L. A. Weaver, of the University of Missouri College of Agriculture, for success with young pigs. The fastest and cheapest gains are made on a pig before weaning time so that ordinarily it will pay to keep the small pig growing as rapidly as possible. The sow should, of course, get some good milk-producing feed, and she should be fed full capacity as soon as the pigs are old enough to take al lthe milk she will give. It will not pay to limit the feed at this time since the pigs make the most economical gains from feed fed through the sow. When the pigs are about a month old, they will be able to use more feed than that obtained from the sow, even though the sow is properly fed and a good milker.

As soon as the pigs will eat, which is usually at four or five weeks of age, they should be fed separately from their dam. A creep should be made so that they may have access to a small pen where the sow cannot get their feed. Skim milk fed in a shallow pan is very good for them. The pigs may also be taught to run into the creep for feed by allowing them some suitable grain. As soon as they begin to eat well, a slop made of milk, some shorts, a little bran and some linseed oil meal or tankage fed along with the grain, will make a ration which with proper exercise will not cause thumps or scours.

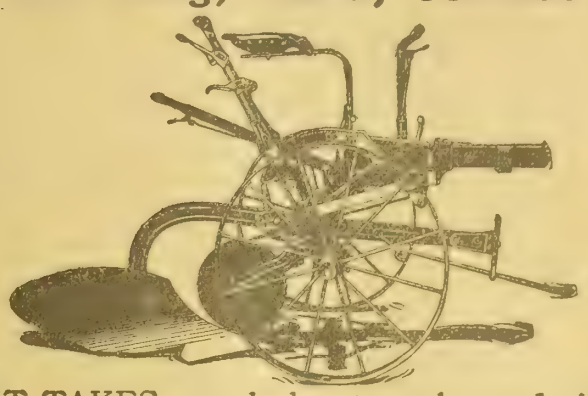
Perhaps the most common troubles caused by improper feeding and care of young pigs are scours and thumps. Scours are usually caused by changing the feed of the sow, by over-feeding, by dirty pens and troughs, or by exposure of either the sow or pigs to cold rain or to cold weather.

Changing from sweet to sour milk, or feeding too much high protein feeds, such as tankage or linseed oil meal when the animals are not accustomed to it, may cause the trouble. If the sow is fed too much her milk flow will be greatly stimulated, and the young pigs will receive more than they can utilize thus causing scours.

The first treatment in the case of scours is to cut down the sows feed and clean her quarters. A tablespoon of sulphur in her feed for two days will also be beneficial. Scalded milk or a good physic, such as Epsom salts, is helpful. A teaspoon of castor oil or Epsom salts should be given to the pigs. Charcoal is sometimes used. White scours, which is contagious, may be treated by cleaning and disinfecting the pens and by giving a good physic.

Lack of sunshine and exercise, together with excess feeding, cause thumps. A remedy is to cut down the mother's feed and force the pigs to take exercise in the sunshine. Thumps in large pigs which have been weaned is usually caused by some affection of the lungs or of the bronchial tubes.

Hamilton Plows
for Long, Hard, Service



IT TAKES a real plow to make good with the plowing experts of Eastern Canada. Therefore, we take pride in the fact that the **Hamilton** No. 126 sulky meets with their approval.

It is adjustable to all conditions. It is easy to operate. It is built to do first-class plowing for many years. Note the handy pole shift. With it you can instantly change the landing of the beam, straighten crooked furrows, adapt the plow to side-hill plowing and to the turning of short corners.

The **Hamilton** 126 is a two-wheel sulky with a horse lift—a simple type that is remarkably easy to operate. The horses do practically all the work, yet the draft of the plow is so light that they do a full day's work with it.

The **Hamilton** line also includes tractor plows, walking gangs, two-way plows, and a choice assortment of walking plows. All are made with the thoroughness you will find in the 126 sulky. Note the new spring beams and long handles of the walking plows. Write us for **Hamilton** plow folders.

FINISH YOUR CATTLE

While there has been a numerical increase in live stock in Canada and the United States, owing to advanced cost of feed and the eagerness to realize on the high market prices, there has been a tendency found in all the live stock markets for farmers to ship cattle and hogs before they are properly finished. Loss of weight approximates 10 per cent. Far-sighted live stock men make every effort to finish thir cattle before marketing.

BEST FIVE YEARS IN POULTRY HISTORY JUST AHEAD

Now is the beginning of the best five-year period for profitable egg-production ever known.

We believe it will be the best five years that will ever be known.

All Europe has very little poultry. Some parts none at all.

All Europe will become a bidder in American markets for poultry and eggs.

American breeders must furnish the breeding stock for the renewal of the European flocks.

It will take at least five years before Europe can be selfsustaining in poultry products.

These facts make for continued high prices of poultry and poultry products, even after prices of grains have declined.

This means that farmers will be able to realize for the next five years more for the grains fed to hens for egg production than will be possible by any other process of marketing. We feel confident that by following proper practices in poultry keeping at all seasons of the year that double the market value of grains may be realized by the feeding of it to hens for egg production.

Begin now—this season—to make your poultry work count. Give it a definite place in the daily work, keep accounts and compare returns for effort expended with other farm operations. If this is done results will be more evident and you will appreciate your poultry as revenue producers.

Practice right selection in breeding.

Provide proper housing conditions.

Feed liberally rich foods to obtain high egg yield.

Hatch early. Early hatched pullets lay fall and winter eggs.

Practice good sanitation.

Keep hens free from lice and roosts free of mites.

Take good care of eggs, gather daily, market often.

The hen lays a perfect egg. See to it that a perfect egg goes to market. Good eggs bring top prices.

The Way to Tell a Good HARNESS

Every manufactured product that is worth it, is marked by the maker with his *trade-mark*. Harness is no exception. To be certain you get BIG VALUE and get a set you can DEPEND UPON, get the famous TREES HARNESS, sold all over Canada as IMPERIAL BRAND, and trade-marked with the Horse's Head in the Horseshoe. Watch for this trade-mark in buying and always ASK YOUR DEALER for IMPERIAL BRAND HARNESS. We prefer to have you buy it from your dealer but, if he hasn't it, write direct to us. Prices range as low as $22 a set, single, complete, and $39 a set for team, without collars. Harness cheaper than this is not safe to buy. Our cheapest harness is SOLID VALUE and, in its class, is by far the best for the price. Our Buggy Special at $28 is one we strongly recommend for strength, good looks and long service. We have a stock of everything in the harness line and can supply you promptly. It only costs 3 cents to write us and find out all you want to know.

THE HORSE

WILD HORSES OF THE PLAINS

El Comancho

When the Spaniards came to America they brought the first horses to the continent. The animals escaped and were left behind by the Spaniards to become the parent stock of future herds of wild horses that ranged the Plains from Mexico to as far north as Saskatchewan and possibly further.

Horses from early American settlers escaped from time to time or were run off by the wild horse bands and added to the blood. Indian tribes caught them in numbers and re-domesticated them, using them as a means of transportation which they had never known before the advent of the Spaniards. Indeed, it was the possession of horses that made the Plains Indian tribes possible, and later made roaming warriors of them, for they never traveled far before they had horses.

Some tribes became horse breeders and turned out fine stock; the Comanches of Texas were almost like Arabs in this matter, and the Cheyenne tribe of Wyoming gained fame as producers of the famous "pinto" or "painted" (spotted) horses of the Plains.

Bands of wild horses could be found almost anywhere where feed and water conditions were favorable, as late as the eighties. Two such bands ranged in the sand hills of Nebraska between the Platte and Niobrara rivers, the habitat of one band being around the head of Dismal River and the range of theother band being along the Loup River.

Wild horse herds were always led (and strictly herded into individual bands) by individual stallions who looked after their charges with almost human intelligence, leading them to feed and water and guarding them from danger of every sort. These stallions would fight each other and any wild enemy such as the grizzly bear, with all the wild ferocity of a tiger. They would even attack man if he was afoot and alone, as many an Indian or white horse-hunter can testify.

The two stallion leaders of these Nebraska sand-hill herds were well known up and down the Plains for a number of years and every device and plan was tried to "get" them. One was a coal-black trotter with long sweeping mane and tail—as beautiful an animal as ever ran free under the sky. The other was a bay pacer with cream mane and tail that swept the ground and gave him a comet-like appearance while running full speed. Two finer horses never lived, I verily believe. They were much sought by horse hunters for several years and were finally captured.

Indians tried to "walk them down" by keeping them moving slowly all the time, without a chance to feed or get to water, but they could never get either one. Cow-men tried encircling the herds and "roping" them many times. This method resulted in the capture of the bay stallion on the head of the Middle Loup in 1835 (I think it was) by a gang of men from Stems Ranch and other ranches of the region.

The black stallion was "creased" by a rifle shot through the top of the neck by a single hunter who thus captured the big fellow a years or so after the bay was caught. The black was captured miles to the northwest of his old range in the sagebrush desert of Wyoming after nearly all his band had been captured by cowboys on regular organized horse hunts that often resulted in the capture of a whole herd at once.

The horse was the unit of value in trade among all the Plains Indians; the man who owned "many horses" was rich—he who owned noen was poor. A wife was valued by a certain number of horses, the more desirable she would bring to her father when marriage day comes around. Next to the buffalo, the horse was the most valuable of all Plains animals to the Indian tribes.

Indians had always used dogs for pack animals up to the time they got horses from the increase of the Spanish herds, so it is only naatural perhaps to find the Sioux calling the horse Shunks-tonka, literally "big-dog," because they could pack all their stuff on his back just as they always had packed it for transportation on dogs before.

The Blackfeet took a somewhat different view of the animal and called it Pon-kom-i-ta, which means elk-dog or more nearly like-elk-like-dog." Undoubtedly this name was selected because, in size, the horse was "like-the-elk" but without his big horns and, because they could pack their belongings on the horse, he was "like-the-dog" who had almays been their pack animal before. Therefore the name "elk-dog" as above.

The Crow Indians who lived in the Yellowstone River country called the horse –cheta. Just what this name means I have never learned but it is likely somewhat similar to the others.

The last wild horse herds that I know of were ranging in Washington and Oregon, but these were rounded up and captured several years ago and as far as I know the real wild horse of the Plains is gone forever now, the nearest approach today bein ranch horses which still run the open range here and there.

Federal Assistance to Horse Industry

A practical policy that could be adopted in many sections of the province, to the mutual advantage of both the owners of stallions and mares

The Livestock Branch of the Federal Department of Agriculture, Ottawa, offers assistance to the farmers of any district, with certain restrictions and under certain conditions.

The farmers of the district that wish to secure the service of a sound, absolutely good, pure-bred stallion, at a nominal service fee, must organize themselves into what is known as a Breeders' Club.

Obligations of the Club

1. The Club shall guarantee the stallion owner a definite number of mares at a certain service fee per mare, said mares to be in good breeding condition, and not afffcted with any contagious or infectious disease.

2. All stallions named by Clubs for the purpose of securing Government assistance must be submitted to an examination by an authorized veterinary surgeon.

3. The Secretary of the Club shall forward to the Livestock Branch, with the regular application, a list of its members, also a copy of the memorandum of agreement signed by both parties interested. This agreement shall not become binding until approved by the Livestock Commissioner.

4. The minimum service fee shall be not less than Twelve Dollars.

5. All service fees shall be collected by the Club.

6. Payment of service fees shall be made as follows: one-third of the service fee for each guaranteed mare shall be paid by the Club to the stallion owner at the end of the service season.

7. The remaining two-thirds of each service fee shall be paid when the mare proves to be in foal. That is to say, the remaining two-thirds shall be paid for only such mares as prove to be in foal.

8. At the end of the service season the stallion owner shall furnish the Livestock Branch with a sworn statement setting forth the number of mares bred to his horse and the name of the owner of each.

Government Assistance

1. The Livestock Branch shall pay the Club an amount equal to 40 per cent of the total amount paid at the close of the service season; that is, 40 per cent on the full number of guaranteed mares.

2. The Livestock Branch shall pay the Club a second grant, equal to 40 per cent of the amount paid to the stallion owner, on the total number of mares that prove to be in foal; that is, 40 per cent of two-thirds the service fee paid for each mare that proves to be in foal.

Suppose a Club could guarantee 100 mares and that the service fee was $12.00. According to the rules laid down, the Secretary of the Club would pay the stallion owner, at the end of the service season, one-third of the total fee; i. e., $4.00 on each mare guaranteed by the Club or a total of $400.00. The Livestock Branch will reimburse the Club to the extent of 40 per cent of this $400, or $160.00.

Further, the Club is supposed, after the mares are in foal, to pay the stallion owner the remaining two-thirds of the service fee on all mares in foal. Suppose 75 mares prove in foal; two-thirds of $12.00 service fee is $8.00; that is, $8.00 on each of the 75 mares, or a total of $600.00. Of this amount, the Livestock Branch offers to pay a further 40 per cent or $240.00.

These two grants of $160.00 and $240.00 equals one-third of the service fee of $12.00 on all mares guaranteed by the Club.

The Provincial Minister of Agriculture, the Hon. J. F. Tweeddale, is very anxious that New Brunswick farmers take the fullest advantage of this offer by the Federal Department, and promises that the Departmnt will aid in the organization of the Clubs by supplying a representative.

Stallion owners, as well as farmers, who are interested in this should apply to the undersigned for more particular information on the subject.

How I Make Big Money Out of "Ornery" Horses

By J. A. BUTLER

ABOUT two years ago I witnessed up in New York State an exhibition of horse-training that opened my eyes. A man by the name of Mackley took a devil of a mean, vicious mare that hadn't been harnessed for seven months and in a few days had her gentle enough for a school girl to drive. Mackley had taken the mare off the owner's hands for $50 and just ten days after sold her for $175.00. A clear profit of $125.00 in ten days!

That started me investigating. I learned that Mackley had simply used the methods introduced by the famous horse trainer, Jesse Beery. Beery, I learned, used to go about the country giving wonderful exhibitions in colt-breaking and horse-training; but realizing that he could accomplish more by teaching his methods by mail, had given up his exhibition work to spread his horse-training secrets by mail-instruction. Mackley had studied Beery's Course in his spare time and in a few months was able to accomplish magical results with green colts and horses with bad habits.

Other Successes

Mackley's work showed me a way to make some nice money and I determined to take Prof. Beery's Course in horse-training—but before doing so I made further inquiries. Here are what a few of Beery's students said. I'll let them tell of their success in their own words.

Mr. S. L. Arrant writes: "Just to test Beery's methods, I bought the worst balky, kicking, fighting horse I could find. Paid $65.00 for him. After handling him only a few hours according to Beery's system I sold him for $135.00.

Mr. Dell Nicholson, Portland, Mich., writes: I have trained a four year old mare that was given up by everybody. Bought her for $35.00, and now have her so gentle, my little boy handles her. Wouldn't take $200.00 for her.

Dean L. Smith, Findley, Ohio, writes: By following Beery's instructions have changed a worthless, dangerous balker into a horse worth $225.00.

Everett McBlock, Elkhart, Ill., writes: Have just broken a pony to drive and taught it some tricks. Owner bought it for $17.50. Paid me $40 to train it. He just sold it to a show company for $150.00.

How I Work

The big source of my income is in buying up "ornery" colts and horses at bargain prices, and after training the animals, selling them at a good profit. However, I also pick up good money handling colts and training horses for others on a fee basis. For instance, a farmer had a beautiful driving bay that had the bad habit of shying. A piece of paper blowing across the road would set the horse crazy. The owner thought a great deal of the animal, but couldn't take chances on the shying habit. A friend of his for whom I had done some work put this man in touch with me and in a few hours I had the horse completely cured of the habit—for which job I received $50.

Curing Bad Habits

You can see from this that my work consists not only in breaking colts and "gentling" vicious horses, but in curing the various bad habits a horse can have—such as shying, balking, fear of automobiles, etc., pulling at hitching strap, pawing in the stall, etc. etc., Beery's methods of colt breaking are particularly amazing. Under the old way of handling green colts one usually had to half kill the horse as well as himself to accomplish anything—and then the colt was usually spoiled or hurt in some way or other. But, when you apply Beery's principles, there is no hard, long work or injury to the colt.

No one should have a biting, kicking or balky horse when it is so easy to cure these vicious habits. No one should attempt to break in a colt the old fashioned way when Beery's methods make the task so easy. To every horse owner, to every lover of horseflesh, my advice is to get acquainted with the Beery principles. You can not only make money for yourself, but you can do a world of good, particularly at this day when war-demands have placed a premium on horses.

Wonderful Book Free

I have been requested to state that Prof. Jesse Beery will send his remarkable booklet, "How to Break and Train Horses" free to those interested. It is a booklet well worth having as it reveals some startling information on horse-training. I have heard men who considered themselves expert horsemen say that the booklet was a revelation to them. There is no use in my going into details on the booklet when you can get it free for the asking.

Just drop a line to Prof. Jesse Beery, Dept. 0000, Pleasant Hill, Ohio, and the booklet will be sent free by return mail. A postcard will do as well as a letter.

CHEAPER THAN A WHIP AND BETTER FOR YOUR HORSES

A horse with bruised, galled and chafed neck or shoulders can't earn his feed. Whipping only increases his suffering. You can prevent such injuries for less than the price of a good whip. Equip your faithful animal with Tapatco—The pad made with our

NEW PATENTED HOOK ATTACHMENT
(Found Only on Pads Made by Us.)

Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. Life of pad is thus materially lengthened. This is the greatest improvement since we invented the hook.

STUFFED COLLAR PADS

TAKE MENDING WIRE ALONG WITH YOU

No one should leave home with a buggy or wagon without a small coil of copper wire, one which has many different parts or as frequently designated, "multro in parvo." This sort of knife has various parts, and among them should be one for boring holes through leather strops. In case a strop or trace should break while away from home, one would be in an awkward condition, if without any means to repair it. An instrument for boring the holes and some copper wire will save the day. The broken ends may be laid over each other and boring a few holes on each side, the wire may be threaded as in "back stitching." The ends of the wire may be twisted together and the job is done.

If the break is a chain the links may be connected by substitute of wire which will render service until home is reached. While these repairs should not be permanent, yet it is of importance to be able to get where permanent repairs can be made. The uses of the thin wire are innumerable. Nothing holds buttons on working clothes in an emergency better than thin copper wire, and frequently it is permanent for it renders lasting satisfaction. The wire will pierce the cloth like a needle and the work is done. Carefully twisting the ends of the inside holds it securely. Take it all in all, one would have to search long for for something that will give more service for its size than a roll of copper wire.

A CURE FOR SCRATCHES ON A YOUNG MARE

What can I do for scratches that have broken out on a young mare? She has had them for about five weeks and I have tried several remedies to cure them.—T. C.

Reply. — Scratches sometimes require considerable perserverance to cure them. They are caused by exposure to cold, mud, snow, slush or ice water, without proper care in fall, winter and spring. When the horse comes in, wipe off the parts as nicely as possible, bandage them with flannel to keep them warm, and when dry clean them thoroughly with a brush, not touching them with water at all. When clean apply carbolic acid salve or an ointment made of lard and pounded alum in equal parts. Give the horse rest from work, if you are working him, while attempting a cure. Give him a teaspoonful of saltpetre in feed night and morning.

Every horse owner should be on the lookout to prevent scratches at all times, as they are very difficult to cure when once started. The best preventive is to clean and dry the feet thoroughly every time when coming in from cold slush or mud. Never wash the feet and legs in cold wet weather say after November 1st till May 1st. It is good for them to be washed in hot weather.

Look out for soft spots in the field. They cause a good proportion of the sweenied and other joint ailments of the horse.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc. It is invaluable.

Every bottle of Caustic Balsam sold Warranted to give satisfaction. Price $ 1.75 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

EGG LAYING CONTEST

The egg laying contest conducted on the Experimental Farm, Charlottetown, P. E. I., under the auspices of the Federal Dairy Division and in which there are twenty pens of eight birds each: Representing Prince Edward Island, 7 pens; Nova Scotia, 5 pens; Quebec, 4 pens; New Brunswick, 3 pens, and Ontario, 1 pen.

The pens include: S. C. White Leghorns—8; Barred Rocks—5; Rhode Island Reds—3; White Wyandotte—3; Anconas—1.

The contest tsarted on November 1, 1918 and will end on September 30, 1919. J. G. Morgan is Superintendent of the contest and L. J. Howatt is the Recorder.

Following is the standing of the various pens in order of merit, for the month of November:—

Pen No	Owner	Variety	Age	No. Eggs laid	Total Eggs to date
11	James Speirs	" Wyandottes,	Hens	76	76
6	W. L. Warren,	" Wyandottes,	Pullets	70	70
12	C. B. Chapman,	" Leghorns,	Pullets	33	33
10	Thos. J. Adamson,	Barred Rocks	Mixed	32	32
8	W. E. B. Tait	Barred Rocks	Pullets	31	31
5	Bert Horsfall	White Leghorns	Pullets	29	29
7	H. W. Dowton	Rhode Island Reds	Pullets	27	27
3	N. S. Agricultural College,	White Leghorns	Pullets	25	25
15	A. T. Reed,	Barred Rocks	Pullets	19	19
19	Molly Neales,	Barred Rocks,	Pullets	16	16
1	Henry W. Cain, M.D.,	Rhode Island Reds	Pullets	14	14
13	W. J. Pickard	White Leghorns	Pullets	10	
9	P. E. Aird,	" Wyandottes	Pullets	6	
2	F. W. E. Haslam,	" Leghorns,	Hens	6	
14	Mrs. McMillan,	" Leghorns,	Hens	6	
16	Rev. J. J. McDonald,	" Leghorns,	Pullets	5	
12	Wm. Neales,	" Leghorns,	Pullets	3	
18	B. Rodd,	Barred Rocks,	Pullets	2	
17	Wm. J. McKinnon,	Anconas,	Pullets	1	
4	Wm. Retson,	Dhode Island Reds	Pullets	0	

CURIOSITY MAY SPOIL THE HATCH

Many people using incubators forget the old maxim about counting their chickens, and by opening the door to see how many eggs are pipped, materially reduce the number finally hatched. The last three days of incubation is the mots critical part of the hatching period, and the care at this time has an important bearing upon the hatching percent. At this stage the control of temperature and the regulation of moisture supply are particularly important. The temperature after the eighteenth day must be watched carefully. The activity of the chicks creates heat, and there is a tendency for the temperature to rise. Any considerable increase in the heat in the machine weakens the chicks and drives out moisture thus causing the chick to dry fast to the shell. Opening the incubator door to show the neighbors what a wonderful hatch is promised, also allows the moisture to escape, cools the machine and thus gives the chicks a shock which adds materially to the list of dead in shell.

On the eighteenth day the machine should be closed and not opened again until the hatch is finished. During this time the temperature should be watched closely and regulated by turning the lamp down so that the temperature on a level with the top of the eggs will not be above 105 degrees. The machine should be darkened during the hatching period to prevent the first hatched chicks from trampling those coming out later. There is nothing gained by helping chicks out of the shell as those unable to egt out unaided are not worth the effort required to help them out. After the hatch is finished the shells and unhatched eggs should be removed and the temperature of the machine gradually reduced to about 95 or 98 degrees and the chicks left in until the brooder is ready.

INCUBATION

The keynote to successful winter can be well ventilated without egg production is "Early hatching." It matters not whether the natural or the artificial method of incubation be used, the chicks must be hatched early, if the best results are to be obtained. If it is impossible to secure enough broody hens early in the season to hatch the number of chicks required, purchase an incubator.

In buying a machine, it should be borne in mind that at the most only three hatches can be taken off in the proper hatching period. The incubator, therefore, should be of sufficient capacity to produce at each hatch at least one-third the number of chicks required.

There are a lot of good incubators on the market. Do not be deluded into buying a machine just because it is low in price. The low-priced incubator is very often the most expensive in the end.

The incubator should be placed in a room that is fairly even in temperature, has a good, solid floor, and that draughts.

In running any incubator, the manufacturer's general directions should be carefully followed as he is the one that should know best what his machine requires.

At the same time, a little variation in the handling will often greatly improve results. Climatic conditions sometimes alter requirements. A machine that does not require added moisture in on locality may in another. A relative humidity of between 50 and 0 inside the egg chamber gives the most satisfactory results; if a machine is not giving these conditions, moisture should be added. This may best be done by placing a tray of wet sand either under the egg tray or above it, depending on how the machine is heated.

In starting the machine, run it for several days until it is perfectly regulated before putting in the eggs. The two kinds of thermometer most commonly used are the standing, which should register about 102, and the hanging, which is usually hung and should register 103. If the hatches are slow in coming off, raise the temperature in succeeding hatches and vice versa.

From the second day until the eggs begin to pip, they should be turned twice a day. They should also be cooled, the length of time for cooling depending on climatic conditions and the temperature at which the machine is being run.

It is advisable to test the eggs twice during the hatch, once about the seventh day when the inferile eggs and "blood rings" should be removed and again about the fourteenth when all dead germs should be taken out. A little practice will soon teach just what it is safe to take out and what to leave in.

As soon as the eggs begin to pip, which will usually be about the eighteenth day, close up the machine and leave it until the hatch is over. When the temperature rises a degree or two, don't get excited, as the rise is to be expected at this time, and is a good sign. It is due to the heat generated by the chicks struggling to free themselves from the shells. Wait until the hatching is over and the chicks have become thoroughly dried before opening the machine.

POULTRY AND EGGS TO LIQUIDATE NATIONAL DEBT

"Poultry and egs alone could pay Canada's National War Debt," says Mr. Fred C. Elford, Superintendent of the Poultry Division of the Dominion Experimental Farm, Ottawa. And he produces the following figures to prove it:

"Canada's net national debt on October 31, 1918, was $1.247.000.000. We have adopted the slogan, 'One hundred hens to every farm, ten hens to every urban lot.' That would mean taking 1,000.000, as the round number of Canadian farms 100.000.000 hens in the country, and 10.000.000 hens in the cities, towns and villages, a total of 110,000,000. Of course everybody in the city could not keep hens, and many would not even if they could. But many people in the suburban districts of the cities, and in the small-

FARMERS FRIEND FENCING FROM FACTORY to FARM

Announcement

The advent of peace, welcomed with joy in every home in the Dominion, brings to every one of us Canadians a new meaning, new opportunities, new responsibilities, as regards our citizenship in this great and growing Nation.

To carry on during these reconstruction days, to build and rebuild for permanency, in everything that makes for peace, plenty and perpetual prosperity, is the ambition of every one of us. Every farm home in Canada must be made pleasant and comfortable. Every field, garden and lawn must be substantially, conveniently and pleasingly fenced. Our greeting to you at this time is to remind you of our part in Canadian development in the past and ask your co-operation and continued patronage for the future. May we, therefore, direct your attention to some of the fence facts that should be known and rightly understood by every patriotic citizen desirous of making Canada a better place to live in these days of well-earned and well-deserved peace.

FIRST, the time to buy and build fencing is now. Our improved and enlarged facilities, being as the largest fence factory in Canada, enable us to offer for Canadian farms a standard, honest and efficient service. We are the "Farmers friend," then, last and all the time. Why? Because the farmer is our customer. We manufacture just such fencing as best meets the needs of the former.

SECOND, the purchasing power of every farmer is the highest ever. The farmer's medium of exchange—his crops—is produced at comparatively large. A bushel of wheat or a ton of hay will buy as much fencing now as ever before. Prices will not—cannot—be lower for a long time to come. We must pay prices of farm products. What the farmer produces and has to sell, that which represents his buying power, the world needs and must have just the price he gets it. Nor will the price of manufactured fencing be lower for a long time to come. Wire prices and the factor are dependably fixed. That fixes the price for Canada. What real difference does it make as long as the parity is maintained? When the cost of farm products is reduced, then and not until then will wire prices be lessened. It is to your advantage, therefore, to buy and build now.

THIRD, the Sarnia Fence Company has saved the farmers of Canada thousands upon thousands of dollars in actual money saved. Our plan of saving money for you is made possible under our selling system of direct dealing from factory to farm. Just two profits in the transaction—yours and ours. We are partners in the fence business. You buy and buy again, and others do the same. Satisfied customers mean a growing business. We pay nothing for your patronage, besides a good service rendered. You save by dealing directly with us on our direct dealing plan. It is a mutual co-operation between manufacturer and user of fencing that produces real fence satisfaction.

FOURTH, our price is always low—very low. If you could save twenty per-cent by buying from us, would you do it? We always quote lowest prices for just the kind of fencing you may need. Write us before you buy. Tell us your plan. Our expert advice may help you to a wise selection and, perhaps, mean a great saving of money. It is safest to know the truth about fencing before you act. Remember, we are fence manufacturers. Our one moderate profit added to actual cost of production leaves a larger profit for you.

FIFTH, our business is built upon the service basis—a real service to our customers—the satisfaction kind, the kind that lasts and brings repeat orders and induces your neighbors to do likewise. We owe the farmers of Canada the best fence service we are capable of giving. The farmers of Canada owe us their patronage as a consequence.

SIXTH, the Sarnia Fence Company saves money to every farmer who patronizes us. Our improved facilities, enlarged working capital, together with the fact that we have recently added to our management and working force the best fence talent obtainable, puts us over the top to your satisfaction. Our guarantee is back of every promise we make. Everything is just as represented in our advertising literature. Thousands of farmers testify as to the good quality of our fencing. The money you save and the satisfaction you get in dealing direct with us will be your compensation.

SEVENTH, we prepay freight on all fence orders over 200 lbs. Our prices are quoted on fencing delivered at your nearest station. You pay but once. That covers the price of the fence and the transportation to your home town, excepting electric lines and on steamboats.

This announcement will be followed by others in the Farm Papers of Canada from time to time. Do not wait, however. Cut out this announcement and get our name and address correctly fixed in your mind. We want you to know the truth about Sarnia fencing. No trouble to answer questions. Write us about your fencing plans. We are specialists in the fencing line and are here to help our farmer friends. Our advertising literature describes in detail the Sarnia fence and the best method of fence construction. It will make plain to you the Sarnia plan. We are yours to serve.

Yarmouth, N.S.

towns, and the country villages could keep more than then—20, 30, 50, 75 perhaps. So take an average of ten. A good select hen will produce 200 eggs a year. But taking a low estimate of ten dozen eggs a year (120) for 110,000,000 hens and we would produce 1,100,000,000, dozen eggs a year.

"At the present time we consume in Canada 23 dozen eggs per head of population per annum in Canada. We could increase this allowance to 50 dozen, a total of about 350,000,000 dozen. We use less than 25,000,000 dozen of our eggs at the present time for incubation. Suppose we increased this to 50,000,000 dozen. That would total 400,000,000 dozen for Canadian consumption, a very liberal allowance. We would then have left for export 700,000,000 dozen at an average price of say 40 cents per dozen. That would bring $280,000,000 per year into the country from eggs alone. The interest on our debt of $1,247,000,000 at 5½ per cent will amount to $68,585,000. We would pay this interest and apply a balance of $213,415,000 to reducing the principal every year. In less than six years Canada's hens would wipe out the total monetary cost of the war to Canada, and our total net national debt.

"I do not say that Canada will do this. But I say that Canada might well aim to do it, for it is within the possibilities of what could be done without undue strain upon our present labor capacity."

EARLY PULLETS FOR WINTER EGGS

When we take into consideration that the average egg production on the Canadian farm is 75 or 80 eggs per hen and when well managed flocks average 120 to 180 eggs, and individual hens even go higher than 300 eggs in the 12 months, it looks as though improvement might be made in the class of stock many keep. In the first place, purebred stock is best. They should be free from a good laying strain. They should be from good healthy parentage and for winter egg production, pullets only and early pullets should be kept. In an experiment conducted at one of the Branch Experimental Farm where four different ages of birds were in competition for winter egg production, it was found that early pullets produced eggs at an average cost of 16.7 cts., late pullets 28.2 cts.; two-year old hens 95.1 cts.; three-year old hens $8.76 per dozen. Figures somewhat similar to these could be procured in larger quantities. The early pullet is the only bird that should be kept for winter egg production and it is the winter eggs that pay. A dozen of eggs at Christmas is worth two or three dozen in May or June. Early pullets mean early eggs and early chicks in the spring which of course means early pullets in the fall. As a rule, the pullets that lay earliest are the best layers so that every pullet that lays before Christmas should be marked. The yare your best layers. If you are killing off year old hens, do not kill hens that moult late in the fall. They are your best layers and with your best layers should always be mated male birds from good layers. The male is more than half the flock. A male from a good laying strain and especially from a good laying mother will do more to build up the laying quality of the flock than any other one thing. Don't use then for breeding purposes, cockerels whose pedigree you know nothing about. Better pay a good price and get a good bird.

FEEDING POULTRY FOR EGGS

It is possible to double the egg yield of a flock of hens and actually save feed at the same time if the hens are properly card for and fed the same ordinary grains used now but furnished them in correct proportions, amounts and proper manner.

The food administration of the United States Government finds more eggs must be produced. To that end, last spring, an embargo against selling hens for meat consumption was placed in effect for several weeks. It is hoped every owner of poultry will now realize the need of conserving grain by furnishing theri hens only such food as really constitutes a balanced egg making ration. By this we mean a quantity and mixture of such available rgains and foods which the hens can manufacture into an equal number of egg yolks and egg whites.

Hens do better when provided a variety of feed and some hard, sharp grit to help rgind it. Lime from which egg shells are made is also necessary. This is best provided by keeping a supply of ground oyster shell in a box or hopper. A large portion of an egg is water. Large egg yields cannot be obtained without ample pure, fresh water.

The egg production division of the American Experiment Station, has carried out numerous feeding and practical feeding methods and food formulas which will increase the average egg yield and conserve food. The results of these experiments and the most successful feeding methods used are reported in detail in a bulletin just issued by this experiment station and will be sent free to those who really desire the information. Be brief—simply write direct to the American Experiment Station, Leavenworth, Kansas, and request Bulletin number three on "Feeding Poultry for eggs."

HOME-MADE LICE POWDER

Don't let the mites and lice eat up the profits of your poultry flock when a few cents worth of home-made lice powder will free all fowls. An effective home-made lice powder is made as follows: Place 2¼ pounds of plaster of paris in a pan. Then stir in ¾ pint of gasoline and ¼ pint of cresol or 95 per cent. crude carbolic acid until a crumbly powder is formed. Dust the fowls by sifting the powder in the feathers, between the legs, under the wing and along the back.

DUCKS FOR MEAT AND EGGS

"The Pekin breed is kept almost exclusively by producers of green ducks, and also on many farms where they are grown for meat," says H. W. Sanborn, extension poultry husbandman, U. S. D. A. "They fatten rapidly and may be fed on rations recommended for chickens, but better results are usually secured by feeding more green and vegetable feeds and a larger proportion of mash.

"For the general farmer who is more interested in obtaining eggs than producing meat, the Indian Runner is a good breed. This duck holds the same relative position in the duck family that the Leghorn does in the chicken family. It lays a good-sized white egg considerably larger than a hen's egg, and is declared to be a small eater, a good forager, and hardy. The introduction of this breed is helping to build up a trade of first-class duck eggs. These eggs should be marketed frequently, as they depreciate in quality more rapidly than hen's eggs."

Patriotic Poultrymen!

CANADA needs more food. Get maximum results from your layers and breeders.

The constant strain of producing eggs will cause your fowls to break down sooner or later, unless *you help them.*

Pratts Poultry Regulator

URGENT REQUEST OF PREVIOUS SUFFERERS

Hardly a day passes that we do not receive urgent written requests from grateful persons who have been cured of kidney or bladder trouble—to tell all sufferers of these dread diseases what—

Gin Pills FOR THE KIDNEYS

have done for them, and will do for others.

Mr. Arnold McAskell of Hants, N.S., writes: "I have used Gin Pills and they have been a great blessing to me. For a long time I suffered from a pain in my back and could not move without agony. I failed to get any relief, and I grew worse until finally I was confined to bed. A friend advised me to try Gin Pills, which I did. Before I had used one box I began to feel better, and by the time I had finished two, I was completely cured." Mr. McAskell concludes: "I cannot say too much in favor of these great pills, and would recommend them strongly to anyone suffering from kidney trouble."

There are thousands of persons just like Mr. McAskell, who are so grateful for the relief they obtained that they cannot say enough for Gin Pills. If you are afflicted by that Pain in the Back, Headache, Painful Urination, or Brick Dust Deposit—use Gin Pills.

PEERLESS PERFECTION

applies to our Poultry Fencing just right. It keeps your chickens at home—and their enemies out. Each intersection securely locked—the kind that stays "put."

Peerless Poultry Fence

is made of the best Open Hearth steel fence wire—tough, elastic and springy—and will not snap or break under sudden shocks or quick atmospheric changes. Our method of galvanizing prevents rust and will not flake, peel or chip off. The joints are securely held with the "Peerless Lock," which will withstand all sudden shocks and strains, yet Peerless Poultry Fence can be erected on the most hilly and uneven ground without buckling, snapping or kinking. The heavy stay wires we use prevent sagging and require only about half as many posts as other fences. We also build Farm and Ornamental Fencing and gates. Write for catalog. AGENTS NEARLY EVERYWHERE. LIVE AGENTS WANTED IN UNASSIGNED TERRITORY.

Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

As unto the bow the cord is,
So unto the man is woman,
Though she bends him, she obeys him,
Though she leads him, yet she follows,
Useless each without the other.

A KINK IN THE ROMANCE

Another "Janet and Jimmie" Story
By Maude Woodruff Newell

"You see," Jimmie Farnam said clumsily, "she is too young and pretty to be away from home alone, so Mrs. Warren wants her to get in with nice people, and I said I'd ask you if you would have her up to your home some night."

Janet's little-girl face remained half hidden under her drooping hat.

"Of course," she said. Her voice sounded queer to her own ears. She tried, desperately, to make it more natural. "Bring her over to-night, if you want to."

'All right; that's fine. She's working in Grant & Company's office."

Jimmie's voice went on in his rattling, boyish way, but Janet was not listenng. A strange little bewildering sense of loss gripped at her heart. This pretty Betty Houston, why had she come blundering into her life and Jimmie's here at Conway? Because she was alone and boarded where Jimmie boarded, Jimmie must look out for her, he must ride into the city to work with her mornings, and bring her out to meet "nice people," and——

"You are not listening," Jimmie asserted suddenly, stopping in the full flow of his narrative about work, and Mrs. Warren, and Betty.

"Oh, I was thinking," Janet stammered.

Jimmie stopped in the middle of the walk, his big boyish shoulders bent toward her.

"What's the matter?" he asked puzzled.

"I—I was thinking about you," Janet ventured, one of her hands resting shyly on his coat sleeve.

"What's the matter with me?"

His tone was irritated. Once she would have laughed at him, but now, the Fear leaped up within her and strangled her.

She shook her head, silently.

This little walk home from work, at night, with Jimmie was usually a thing to be enjoyed, but now, this last month——

Jimmie bent suddenly and kissed her, in the shade of the big pine-tree, in the half darkness of the deserted country street.

"Now, tell me, honey," he said. "Had a hard day, or somebody was cross to you over the wire, or you don't like my new overcoat?"

His voice had changed. The irritation was gone. "Your overcoat is beautiful," she approved, "and I wasn't so awfully busy to-day. I—I was just wondering if you—if you were contented, waiting for me. I can not leave home yet, and you said you'd just wait till I—could—but now you are foreman—and—you could—have any girl you wanted, you know—and I've sometimes thought that maybe—since, you wished that you hadn't said you'd—wait."

"Oh," teased Jimmie Farnam, "that's some bugaboo. For a sensible business girl, operating one of the busiest country switchboards in Massachusetts, and fooling the whole police force as you did a couple of months ago, when you thought I had killed Quilty——"

Then he saw her eyes.

"Why, honey girl, stop such nonsense this minute. I'm glad I came. I've never been sorry. Didn't I almost have a fit when I thought I'd have to go somewhere else to work, and leave you here in Conway, where I couldn't kep my eyes on you? Come here."

He put his young arms around her, safe in the shadow of the big old tr e. The Fear died down slowly, like a quenched fire; then it quite disappeared. She drew a long, long breath.

"You must scold me," she said. "You must say, 'You crazy, silly child, use your common sense if you have any.'"

Jimmie laughted at that.

"You funny child, come on home, or your mother will think that I've kidnaped you. I have a good mind to, anyway."

"Don't you want to wait, Jimmie?"

"Well, I'll consider it," Jimmie declared loftily. "Can you cook yet?"

"Of course." Janet's accent was firm. "I learn how to cook two new things every week."

Their eyes met and they laughed together. The sky had cleared. Janet's heart soared happily.

"Now, hurry back and fetch Betty Houston if you want to; while I have my supper and change my dress."

"All right, but don't fuss up. She's a good sort. She won't care."

Janet smiled bravely, her chin up. She would not be silly about it, or fret over it. It was all perfectly natural—the two were boarding in the same house, and going in to work on the same trolley day after day. Of course they had become well acquainted. Why not? She would not worry about it.

She said this to herself over and over again through the long, long evening; for Betty Houston came, smart and pretty in a soft silk that matched her yellow hair and set off the baby blue of her eyes; and Janet, trying to be gracious and friendly, soon found that eBtty Houston was not shyly in need of any of her overtures.

The girl was amusing in rather a loud way. Her slang was conspicuous, and as she had no apparent reverence for anything or anybody, the range of subjects for her wit was large.

Janet laughed often, and Jimmie applauded boisterously.

"Some fun, eh?" he whispered to Janet in the little hallway as Betty was saying good night to Janet's mother in the living-room back of the parlor.

Janet nodded, her chin up, her eyes seeking his. Did men care more for a girl like that? Would Jimmie care more—perhaps soon? She did not know how to hold him if he did not want to stay. Could love go, quick, like that, like some gossamer thing?

But Jimmie did not notice.

"Come on, Betty," he urged; "it is growing late, and I have to work for a living, you know."

"Don't let that worry you," she retorted.

Jimmie laughed, Betty giggled, Janet smiled at them from the open doorway, and stood, in the cold wind, and watched them hail the coming trolley, waving to them as they disappeared in the darkness.

She closed the door softly, and stood there in the dark hall. Her throat was dry as though she had been crying. She felt as if she were fighting something that she could not see.

Her mother called to her, but she did not go back into the cheery room where her mother sat reading.

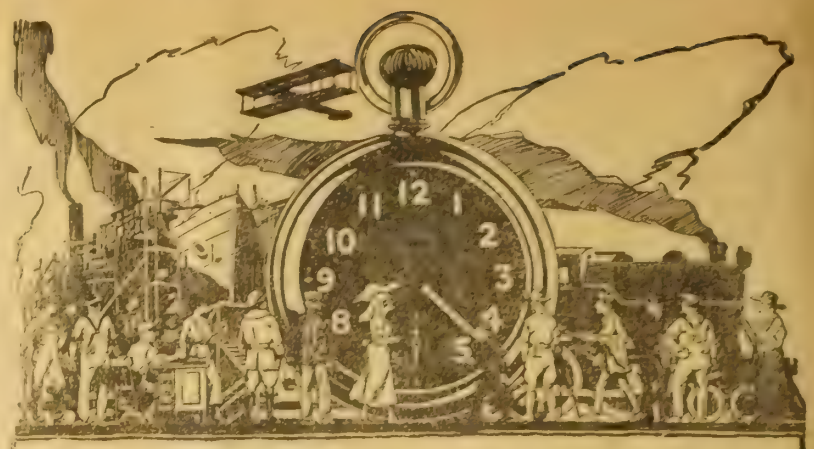
It was raining in the morning, a sullen November downpour, but she faced it bravely and went in to work at nine o'clock. The morning was a busy one. She was thankful for that. Her fingers flew in and out among the green and white cords.

Then it was lunch-time and she trudegd home, a half mile in the rain, and back again. The afternoon was long and dull. At five o'clock she put up her head-piece and breast transmitter with a sigh of relief.

The rain was still piling down. She dd not expect Jimmie to-night, but he mght call her up on her home telephone.

She ate her supper half-heartedly. Her whole body seemed to be lstening for the telephone bell, but it did not ring.

She went to bed early. If it would only hurry and be morning! The night dragged. The next day dragged. The rain turned to snow in the after-



If All The Watches Suddenly Stopped Ticking—

How could the thousands of shipyard workers continue their team-work?

How could the armies of factory hands be ready for the "start work" whistle?

How could railroads with their big groups of employees run on time?

How could the mails be delivered?

How could the newspapers bring the world's news to your doorstep each morning?

A good watch is a necessity. That's why men and women of every profession and occupation depend upon Ingersoll and there is a model to suit everyone.

There is the *Waterbury* with 4 jewels and the *Reliance*, the master 7-jeweled watch, which are the Ingersoll aristocrats—handsome watches that men are proud to carry.

Radiolites that tell time in the dark are indispensable to mine and factory workers, farmers, nurses and soldiers.

The well known *Maple Leaf* is sturdy and reliable and dealers have special models for boys and girls and for women.

Buy a watch with the name INGERSOLL on the dial and you are guaranteed a good time-keeping service.

BISHOPRIC WALL BOARD CO.
LIMITED - OTTAWA

noon and at five o'clock it was quite dark.

She came out, her heart pounding, and found Jimmie waiting, whistling, hs coat collar about his ears, his cap close over his ears.

"Hullo, what's your name?" he said, tucking one of her hands down into his big ulster pocket.

Her heart leaped up and her fears vanished, magically. Why, this was Jimmie, her Jimmie; she was silly to make so much out of nothing. How he would laugh if she told him! She flushed up at him, her blue-gray eyes shining out from under her snow-covered tam-o'-shanter.

"Zenobia," she said wtih a grand duchess air.

"Great Scott!" Jimmie chuckled. "Sounds like an advertisement. Who was she?"

"I don't remember, myself," Janet confessed, laughing. "A queen, or sometning like that."

"Um. Well. If you are a queen, then I am a king. If you're dealing out royalties, I'm going to have mine."

"Of course."

"Some king and queen, walking home in the snow," Jimmie chaffed. "Where's our royal turn-out, and our lords and ladies in waiting?"

"Oh, we haven't our throne yet. We are exiles now."

"In two years more, uh?" said Jimmie.

She nodded.

The snow came down softly on her uplifted face.

"Honey girl," he said and tightened his hand over hers in the big ulster pocket.

Her mother had supper smoking hot when they came in and they had a "royal meal for a royal couple," Jimmie said.

It was late when he went home.

Janet went up to bed, singing softly under her breath.

But on Sunday night when Jimmie came again, he was different, and the Fear crept back again and this time it stayed. For something was plainly bothering him. What could it be? He would be the same old Jimmie for a while, good-natured, fun-loving, then abruptly his manner would change.

His work was all right now; it was not that. He was growing tired of her, tired of waiting, and he did not know how to tell her. That was it! And she did not know what to do.

Betty's voice, one day over the wire, brought the problem home to her sharply. It was nearing Christmas. The board had been ablaze with lights all the afternoon. Janet had worked at a feverish pace to keep up with the rush. Now it had dropped a little, and as Betty called in on Grant & Company's wire, she took the call mechanically.

She repeated, her heart jumping as she recognized the number. Number 229. It was Jimmie's number at the factory.

She plugged in and rang. She heard Jimmie's voice, after a second, and cut out swiftly. She would not listen. She was afraid to listen.

Two minutes, three minutes, five minutes, and still the two supervisory lights showed dead. They were still talking.

Six minutes, seven minutes. She cut in, desperately. Betty was laughing. She cut out again.

After a minute the lights flashed out and she took down the cords. Her hands were like ice.

She tried to fight it out, to be sensible. She tried to think of reasonable explanations for their talking so long together, but she could think of nothing but Betty's gay little laugh, and suddenly she hated her.

She got through the day somehow, and the long evening, for this was not one of Jimmie's nights. The next day Susie Kerwin whispered to her suddenly:

"Saw your Jimmie last night."

Janet tried not to hear her.

"I said I saw your Jimmie last night."

"Oh, did yoh?" whispered Janet.

"Having dinner at Fancher's with a stunning-looking girl, a peach of a blonde."

"A friend of ours," Janet said bravely.

"Oh, she's got the style, hasn't she?"

"Yes, she is pretty."

"Well, if he was my fellow, I'd not let him see too much of a pretty girl like that."

Janet smiled, working on like a machine. There was no feeling in her fingers. So it was true, after all. Would he tell her about it to-night?"

All the way home she waited for it, her hand like ice in his big ulster pocket, but he did not even speak of Betty.

The next few days were days of struggle. What should she do? Tell him what she knew; see what he would say? She could not do that. Give him back his ring, without telling him why? Neither could she do that.

Then another operator saw Jimmie and the blonde walking together another night and Susie told Janet bluntly what she thought about it.

A few days after that Susie told her other news.

"I've seen that blonde twice lately with Mr. Grant. He's no good. He's got a wife and child in Canada. He ran away with one of his stenographers a couple of years ago and then left her, down and out. Better put her wise if she is a friend of yours. Or perhaps she is only playing Grant off against Jimmie."

Janet could not talk about it. Why must they be telling her these things?

she wondered miserably. Jimmie had been really cross the night before. Did he know about Mr. Grant? Was that why? Did he care as much as that in such a little time?

Life was very hard these cold winter days. And there was no one to tell her what to do. She could not bear to confide in any one, not even her mother. She must fight it out herself. The strain of it made her sharp-tongued; she and Jimmie had squabbles, and matters went from bad to worse very fast.

Then, late one December afternoon, th climax came sharply.

She had put up the connection herself, but it was not Jimmie talking this time. It was Grant & Company's wire—it must be Mr. Grant and Betty.

"Seven o'clock train," he said. "I'll get on at the end of the station so I won't be noticed around there. Don't fail me now, Betty."

And Betty's high treble came back gaily reassuring:

"I'll be there."

For a minute Janet's heart leaped up, sick within her. The foolish, foolish girl. So it had come to that? That she cared more for him than she did for Jimmie? And Jimmie, what of him? How much would he care? Would it mean everything to him? Some one must stop Betty and bring her back to him. She must not hurt him like that. Then the other side of it came to her.

With Betty gone, in disgrace, Jimmie would be her own again. He would forget Betty after a while, no matter how much he cared now. Betty was only a butterfly. She could not have won her way very far down into his heart. She certainly could not stop Betty from going with Mr. Grant if Betty wanted to go.

Could she not? The question came to her unbidden. She turned away from it sharply. It came again, and again, and would not let her rest. The train went at seven. Perhaps Jimmie—if she got him on the telephone and told him about it—but Jimmie must not know about it at all, ever. He would never trust Betty again if he did. Some one else must stop her.

It was six o'clock. Janet climbed down from her chair. Her fingers were clumsy with her hat and coat. There was a pounding in her ears and sick little shivers up and down her spine.

She turned away from the main street and took the road toward the railroad station.

It was the hardest thing she had ever done. Slowly she let her dreams go, one by one, and faced what was to come bravely. If he loved Betty and she could save Betty for him, it didn't matter about her, after all.

She was a grub, not made for love and happiness and beautiful things like Betty; she would not try to hold him any longer. She would let him go, as he wanted to go.

It was quite dark along the country road now. Ahead was the tiny box of a country railroad station, and a single black track wound past it over the long low marshes on toward Boston.

She hesitated at the station door. Her heart was in her throat. It must be nearly seven. Where was Betty?

She saw her then, standing trim and stylish in the shadow, and went up to her.

"Hullo, Betty," she said. Her voice trembled.

Betty turned and faced her, swiftly.

"Oh, hullo," she said. There was a sudden guilty fear in her eyes.

"Please don't—go," Janet said softly.

"Don't go where?" demanded Betty. She laughed a little, trying to appear natural. "What are you talking about?"

"You and Mr. Grant."

RATION YOUR CATTLE

It is just as necessary to balance the ration of your cow as it is to balance your ration.

Good health in humans depends on food that provides variety.

And so it is with dairy feeds. You must have protein, fat, carbo-hydrates, etc., or your feeding will not avail.

Now to buy feeds successfully, that is to get feeds containing these necessary ingredients, it is essential to know exactly what is contained in the particular feed bought.

It is up to you to insist upon knowing just what you are paying for—just how much protein, fat, carbo-hydrates, etc., you are getting for your money.

Some buyers rely solely on a name to guide them in their purchases and consequently pay hundreds of dollars a car more than they should for feeds, when feed values are considered.

Our feeds are all "ear marked" with the content of our feeds. You know what you are getting and you can buy them at prices that defy competition.

Thousands of tons of our feeds have been successfully fed this year in the Maritime Provinces.

Canadian Feed Manufacturing Co., Limited

FERTILIZERS !

THE best potatoes grown in N. B. last year were grown with our best by test Potash Fertilizer.

We produce our high grade 2-8-2 and 3-6-5 brands expressly for N. B. potato growing, securing our own potash in Canada, all in water soluble form.

If you are using other makes of Fertilizers try as an experiment some of our brands alongside and watch results.

We produce a full line of Fertilizers. Write us for prices, terms, etc.

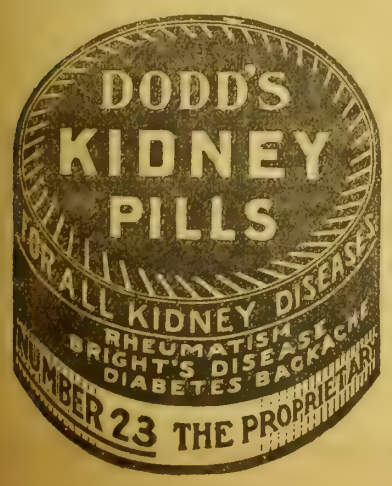
S. KERR
Principal

Minard's Liniment Co., Limited.

Gentlemen,—Theodore Dorais, a customer of mine, was completely cured of rheumatism after five years of suffering, by the judicious use of MINARD'S LINIMENT.

The above facts can be verified by writing to hom, to the Parish Priest or any of his neighbors.

A. COTE, Merchant.
St Isidore, Que., 12 May, '98.



"You crazy girl, what notion have you in your head?"

"I heard it over the wire this afternoon, when you were planning to go."

Betty wilted for a minute, then she tossed her head.

"Well, what of it? It's no business of yours."

"He nas a wife and child in Canada. He ran away once before with one of his stenographers, nd deserted her afterward. He is bad, Betty."

"He says that I am the only one he has ever cared about. Who—who told you all this?"

Some of the definance had gone from her.

"It is true, Betty. I know it. You will be sorry all your life. You are too young and pretty. You ought to have the best—a nice home and husband and children, not a horrible, shameful make-believe of a life. Oh, Betty, please——"

"He will be good, he promised——"

"He didn't keep his promise to his wife. Nor to the other girl, Betty."

Betty shivered suddenly in the cold wind that came over the frozen marshland.

"What made you come?"

"I had to. I couldn't let you go—like this."

"I didn't think you even liked me. Jimmie has been nice to me, but I thought you felt above me—someway——"

Janet put her arm around Betty then. Her heart went out to her suddenly, in a little new feeling that surprisd even herself.

She talked on and on, arguments, persuasions, entreaties, her arm about Betty's waist, her voice choking a little.

"And your folks at home, Betty—your mother——"

Betty's volatile nature was quick in response. She was beginning to weaken.

"Don't," she said sharply, and then she straightened away from Janet.

"But I've got to tell him——"

"No, you go on, and I'll tell him myself."

For a second Betty hesitated. Then, without another word she started back up the dark road alone.

Janet found Mr. Grant at the extreme end of the station platform and delivered her message bluntly, her voice queer and shaking. What he said was not pretty to remember afterward. He was still talking when she left him and ran up the road after Betty.

They walked on hand in hand. Betty was crying softly. At the corner of the street she kissed Janet.

"You are a good girl," she said. "I guess I was crazy. I've woke up now. You won't tell any one, not even Jimmie?"

And Janet, making her sacrifice complete, promised, her face pale, but her eyes shining.

She slept that night as she had not slept for many weeks.

She would give Jimmie back his ring the next night when he came. Her way was quite clear before her now. If he loved Betty, Betty would surely learn to love him after a while.

Of herself she would not think at all. She felt quiet all over the next day, as though she were asleep.

The sight of Jimmie waiting beneath the big pine was the first thing to stab through that numbness.

He smiled down at her.

"Now, tell me all about it," he said abruptly.

Janet stared at him.

"About what?"

"Betty told me all about it this morning."

"Why did she tell you? I—I promised not to."

"I know it, but she felt differently about it this morning. She began to realize what a fine thing you had done for her, and besides, I have known about it for a month or two anyway. Tried my best to break it up, he's such a cad, but she was so set, I couldn't budge her, and I hated to squeal on her. Besides, I kept thinking it would blow over peaceably.

"I took her out to dinner once to keep her from meeting him. I hated not to tell you, but I knew you would wonder why I did it, and I didn't want to squeal, so I kept still.

"It's been some job; it just got me all worked up. I didn't know what to do. She is pretty, but she is such a crazy-head. She was good fun at first, but she wore on me like time after a week or two. She's going hom to Connecticut this afternoon, thanks to you, honey girl."

"Going home," whispered Janet. It was all she could think of to say.

Jimmie's honest eyes met hers.

"Janet, if you were like some of the girls I see, I'd—I'd—well, I don't really know what I would do; but I know what I wouldn't do."

"What wouldn't you do?" whispered Janet.

He put his arms about her carefully, reverently.

"I wouldn't love you as I do, Janet."

WHAT TO DO WITH CAST-OFF TEXTILES

1. Underwear and hosiery may be used for wash-cloths, dusters, dustless mops, braided and woven rugs.

2. Badly worn sheets, pillow cases, and parts of muslin underwear after being laundered may be torn and rolled into bandages and dressings for first aid chests or Red Cross work.

3. Parts of old table cloths may be re-cut for luncheon cloths, table napkins, doilies, and runners.

4. Worn towels make good wash-cloths. Worn Turkish towels make good padding for kitchen holders.

5. Worn curtains make good padding for ironing board or dish-cloths.

6. Pieces of woolen goods, percales, and ginghams may be used for patchwork comforts and quilts.

7. If beyond practical use in the home, cloth or rags should never be thrown away or burned. They are needed in the manufacture of paper.

A PROGRESSIVE BANK

The Canadian Bank of Commerce is rapidly winning its way in Canada to recognition as the "Farmer's Bank." The management of this financial institution awakeend some time ago to the fact that the farmers of Canada are a rather important section of the population and so the Bank of Commerce decided that it would get after the banking business of the farmer. It did that and as the years go by is working harder than ever with that end in view. all of which goes to show that the Canadian Bank of Commerce is a live wire.

Its srong position among the Banks of Canada and its progressive spirit is rapidly winning for it recognition among farmers' organizations.

The branch managers of the Bank of Commerce are getting in close touch with the farmers and are assisting them with advice and in a practical way.

The result is that in many sections of the Maritime Provinces where the farmers are doing business co-operatively, they naturally turn to the Canadian Bank of Commerce as an institution to which they can go and receive every consideration.

The advertising of the Canadian Bank of Commerce wil lappear regularly in "The MARITIME FARMER." Many of its readers have already had business dealing with this bank and tell us that the Bank of Commerce is one which has an attentive ear when the farmer goes to its branch with his business.

PLACING PICTURES AND BRIC-A-BRAC

Don't have too many. That is the first and cardinal principle. Don't make of a home either a museum or a curio shop. If there were no other reason for not doing it, the amount of time and energy wasted in dusting would be a sufficient one. But the effect of a mass of small, fragile articles staring down from wall, mantle and book case is at first startling and then overpowering. All thought of rest or repose in such a room is lost. Some walls seem so overloaded that one has an uncomfortable feeling that the ornaments may come crashing down upon him. If in doubt where there are too many things about, put some away and be on the safe side. It is easy enough to bring them out again if, after while without the articles, the place seems too bare. Few homes err on the side of too little.

In the arrangements of the small things, the same rules apply that were the guide in the treatment of the room as a whole. To scatter a lot of them about and hope that the room will consequently seem better furnished and decorated is to insure an indifferent result. In houses that have been handled by clever decorators, not one little vase, not one tiny picture is placed without careful thought of the effect from every angle and point of view. These minor details indicate the work of the true artist, and perhaps only the true artist can fully appreciate them, but even the most ordinary perception can realize the difference between this kind of a room and one in which there is a haphazard conglomeration.

The pictures on the wall must be hung with as much attention to balance and proportion of spacing and mass as is given the large pieces of furniture. They must be distributed about the room so that no one part will seem more prominent than the other. One wall cannot properly have a group of half a dozen or more striking pictures and the rest of the room have none. If there is no other available wall space, then let the one spot have only one or two pictures that shall not seem to outweigh the absence of them in other parts.

Hang pictures to decorate the wall space. Treat each division of the wall between the interruptions of architectural features, the doors, windows, fireplace, or the furniture, as a panel which is to be decorated, on which the pictures are to be arranged so that the proportions of the space are kept beautiful. The position of the furniture against the wall will influence this arrangement. The furniture will seem partly to support the picture above it, so that a heavy massive frame is out of the question above a slender table which could not in reality adequately bear its weight. In the same way a large picture should be placed squarely over the piece of furniture beneath it so that it may convey the impression of balance.

Think of this wall space as a sheet of paper which is to be divided in such a way that it will become more beautiful and more interesting. Supposing there are three pictures that you wish to put on the wall, the position of the largest is determined by the furniture beneath. You can mark out on a piece of paper the proportions of the wall space and put in it a rectangle to indicate the main picture. Then cut two smaller rectangles in the proportions of the smaller pictures and move them about until you have discovered the most interesting positions. Perhaps one of the most important rules is to remember that when there is a division of space, one part should predominate. That will prevent the arranging of three or more pictures of the same size along in a row with equal spaces between them. It is a much more interesting grouping to put those on each side a little lower or a little higher than the center one. Or if the proportions of the room demand that the wall space be made to seem as high as possible, if the ceiling is low, and a vertical rather than a horizontal motion is needed, place the small pictures on one side above, and on the other side below, the center line. If the pictures are of different sizes, they must be placed more carefully in order to balance well. Rmember the old principle you learned as a child on the see saw board, that the father from the center the lighter the weight required. Thus the smaller of the side pictures should be hung farther from the center picture than the other to maintain the balance to the eye. In certain rooms, when the treatment of the furniture is entirely formal, the pictures should be hung with equal formality. That is the pictrue or the mirror must be placed exactly over the center of a table, and smaller pictures at each side, at even distance, although the effect would be a little stiff and precise. But in other rooms that are furnished more informally, living rooms and bed rooms especially the pictures can well be hung so they do not establish exact symmetry.

The question of how high to place pictures should be settled generally by the arrangement of the space. In rooms the walls which have been properly treated, this will bring the center line of the picture about on the level with the eye of a person standing. It is amusing how short people invariably hang pictures so that they seem too low to a taller person, and a small individual coming into another's home often feels that the pictures are almost to the ceiling. A happy medium should be striven for; five and a half feet is a good average height to have the central point of interest in a picture. This will be somewhat influenced by the relation of it t othe furniture below. A picture carrying out a vertical line of interest over a table so as o have no connection with it. But this relation can often be maintained by a small object on the table such as a candle stick or vase which will reach up to meet the lower line of the frame.

Finally remember that the lines of a picture should follow the lines of a room. Just as the top and bottom of the picture should be parallel with the floor and ceiling, so should the sides be parallel with the wall, the doors and the windows. In other words don't let the picture tilt out from the wall. Put the screws so near the top that the weight of the frame below will keep it upright. This, in a measure applys to the wiring also. It is usually better to have straight wires hanging from two hooks on the molding, than the one forming two slanting lines. But there is no actual principle broken by using the one wire, for the axis of the whole remains truly vertical.

The arrangement of the mantle shelf, tops of book cases, side tables, bureaus and such furnitures, requires exactly the same kind of thought and planning. An exact and careful balancing is essential. Many people understand this means exact symmetry, which is the surest means by which the inexperienced may obtain successful results. A candle stick on one side of a mantle, balanced by its mate on the opposite side, at just the same distance from the end, is sure to be correct. But it is not as interesting perhaps—it calls for much less skill, certainly, than the arrangement which balances objects, differing in mass, color and height, and balances them unerringly.

IS MILK EXPENSIVE?

Do you know that those bothersome bottles the dairyman bangs down at your door with such unfailing regularity contain food that is essential to your bodily welfare? Milk is more than a mere auxiliary to your coffee or to the dessert you prepare for supper. It is real food.

There are certain valuable salts in milk which make it an indispensable factor in keeping the body vigorous and wholesome. Your teeth and bones receive their proper allotments of lime if you include milk in your diet. That same milk, because of its high protein value, keeps your blood and muscles in excellent repair. For these reasons milk is particularly good for your children. Their pliant, growing bodies develop much more easily with its aid.

You realize thta your own body is changing all the time—tearing down and rebuilding its structural cells, but are you aware that milk furnishes just the right kind of fuel for this ceaseless work? It is not necessary to have whole milk, as even milk with the fat taken off contains the desired elements of nutrition. Save every drop of milk, whether whole, skimmed, or sour. Make your sour milk into delicious cottage cheese, or use it in cooking.

Whole milk is especially desirable for children because of its fat content. You can supply fat in some other way for yourself. Give your little girls and boys a quart of milk every day, until they are at least eight years old. After they have passed their eighth birthday, give them from one-half to one pint as part of their diet.

Be sure the milk is clean and fresh. If you live in the city, but it pasteurized from a reliable dairy. In the country see that your cows and milkers are clean and healthy.

With so many ways to use milk you will never be able to say, "I'll drink the stuff, but I'm so tired of it!" Bake

WANTED!

Time to help others!

These GOLD DUST hints shorten household tasks.

Short work after baking

Mixing bowls, rolling-pins, spoons, pans, are obstinate to clean when they get "stuck up." One woman made this discovery: Grease left by shortenings causes nine-tenths of the trouble. She looked around for grease-dissolvents. Gold Dust, being the most effective and gentlest, dissolved that nine-tenths of the trouble. It shortened the work of cleaning up after cooking.

Bathroom quickly cleaned

Even in the bathroom there's a bit of oil, a bit of grease. But Gold Dust quickly gets rid of dark circles and rims in wash bowls and bath tubs—because Gold Dust quickly dissolves the grease. And, you'll find, Gold Dust cleans gently, without scratching or marring the surface of porcelains, enamel, tiling or nickel-plated fixtures.

Sparkling mirrors and windows

Your everyday plain or "pressed" glass will quickly respond to this treatment: Dissolve a tablespoonful of Gold Dust in a dishpan of hot water, and use a small brush. Gold Dust quickly dissolves the thin film of oil or grease, and your glass will sparkle like diamonds. Mirrors, windows, glass doors and set-in glass of all kinds come out from their Gold Dust bath clear as crystal.

A quicker way to wash the dishes

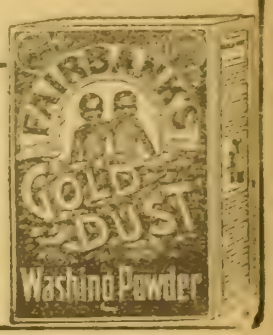
If you want to get rid of drying your dishes with a towel, try this: Use a tablespoonful of Gold Dust to a dishpan of water, wash all dishes of one kind together, scald with boiling water in a wire dish drainer. It is because Gold Dust so thoroughly dissolves the grease that the dishes come out clean and sparkling.

GOLD DUST

The Busy Cleaner

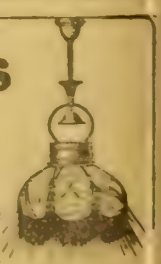
MADE IN CANADA

THE N.K. FAIRBANK COMPANY LIMITED, MONTREAL



Better Than Gas or Electricity

More Economical Than Wick Lamps



Your eyes are worth more than all the money in the world so why neglect them? Install a "Knight" Lighting System and flood your home with the purest, whitest and best light known to science. Costs one-fourth the price of electric outfits. Burns either gasoline or kerosene. Sixty hours of the most beautiful light from each gallon of fuel. No smoke. No dirt. No odor. No chimneys to clean. No wicks to trim. Nothing to get out of order. Simple. Safe. Satisfactory. Send for introductory offer and agency proposition.

KNIGHT LIGHT & SODA FOUNTAIN CO., 240 Knight Bldg., Chicago, Ill.

it in chocolate, cocoanut, and other flavored custards, or make delicious sauces and soups. Use it in junket (especially for children), gravies, and chowders. Combined with rice, tapioca and corn starch, it makes such good puddings. Sherbets, ice creams, hot chocolate an dcocoa, prime favorites all, require a rgeat deal of milk.

When using milk in cookery for custards, cocoas, etc., it is best to scald it over hot water and avoid the danger of its boiling over or scorching.

Remember in making junket, a favorite with the children, that the milk must be just warmed and then the dissolved junket added with the sweetening and flavoring; otherwise the junket will not set.

For custards use one cup of milk to one egg and sweeten with corn syrup. In rice puddings only ½ cup of rice to one quart of milk is necessary. Cook this very slowly for a long time (about two hours) to obtain the best result. For variety, try adding dates with the raisins in rice puddings

If cornmeal, oatmeal or rice is cooked in skim milk, a delicious creamy cereal results. Use the same amount of milk as you would water for the first two, but for rice you can well use four or even more cups of milk to one of rice. Cook for an hour in a double boiler.

Milk has gone up in price, like everything else, but do you really think you can afford to do without it when you compare a bottle of milk with the same money-value in meat and eggs? A noted food expert has said that milk, if it reaches 25 cents a quart, is still an economical food. When you consider that there is no waste in milk, doesn't the statement, even without a scientific analysis, seem reasonable? Of how many of the other foods that come into your home every day, can you say the same thing?

Aside from the money and food value of milk, the extensive use of it is a cooperative measure. Our farmers are paying such a big price for feed for their cattle that, unless we consume the milk, a decided decrease in the number of cattle is inevitable. And, though quickly destroyed, a herd is raised but slowly.

If the demand for milk is large enough, the rancher is encouraged to breed cattle in greater numbers, and in so doing, the price of milk, as well as meat, is kept around normal.

Are you and your children going to take this milk suggestion seriously, and mark up "profit" on your health ledger, as well as in the family account book?

The Salvation Army Million Dollar Fund

MAIL YOUR CONTRIBUTION TO ONE OF THE TREASURERS BELOW, OR TO COMMISSIONER RICHARDS, 20 ALBERT ST., TORONTO

We MUST provide for the need of the Soldier and his family!

It is absolutely necessary to ensure certain safeguards and comforts to our boys over there and over here, so that they may be re-established in Canada, strong in body and soul, contented that we at home have stood by them to the finish. What sacrifice can we make for the boys who were prepared to sacrifice everything for us?

What the Salvation Army Has Done

It has provided comforts for fighting men since the twelfth day of the War.
Hundreds of thousands of parcels of food and clothing for the boys.
Tens of thousands of beds in Hostels in daily use in France, England and Canada.
197 Huts for Soldiers.
1,200 uniformed workers.
45 ambulances.
Thousands of War widows cared for.
Looked after soldiers' families.
Labored for the Master.
Helped to preserve the home ties.
Given the MOTHER touch to lonely men.

What Remains to be Done

Keep the Hostels open and open more, so that every returning soldier can get a clean bed and wholesome meals at a price he can afford to pay.

Provide comforts and safeguards for our boys, advancing into Germany, as well as those coming home and needing a place to eat and sleep, in Halifax, St. John, Quebec, Montreal, Kingston, Toronto, London, Chatham, Winnipeg or Vancouver.

Guide and assist soldiers' families, especially the widows and orphans.

Soldiers Home January — Coming Campaign 19th to 25th

The Salvation Army is equipped and organized to take care of the soldiers' URGENT AND PERSONAL needs—needs that are imperative. It has never made a general appeal for funds to carry on, this work until now. Give and give liberally. If you are not certain that your contribution will be taken up by a canvasser, send it direct to the Hon. Treasurer, Sir Edmund Walker, Toronto—subscriptions will be acknowledged.

"God loveth a cheerful giver"

SALVATION ARMY MILLION DOLLAR FUND COMMITTEE
Headquarters:

Treasurer Toronto and Ontario: SIR EDMUND WALKER, Toronto
Treasurer New Brunswick: JAMES M. CHRISTIE, Bank of Commerce, St. John, N.B.
Treasurer Nova Scotia: DONALD MacGILLIVRAY, Bank of Commerce, Halifax, N.S.

13

PUT YOUR HEATING AND COOKING EQUIPMENT IN GOOD ORDER

See that all the grates are in good order.

Cover all the pipes with asbestos cement to prevent unnecessary radiation.

Learn to use correctly the three dampers: in the ashpit, in the smoke pipe, in the check draft.

Automatic damper regulation is a most important preventive of fuel waste. Install one of the heat regulators if possible.

If not, install a simple damper control operated from a room above; even this helps.

Keep all heating surfaces free from soot.

Remember that the air flow through fuel makes it burn; learn to control your air supply.

Make a real study of the operation of your patricular heater and range.

Rules for Burning Coal

Select a size giving the best control and economy, if the local supply allows you any choice.

With strong draft use the small sizes. With weak draft use the large sizes.

Carry a deep fire—at least level with the fire door.

In mild weather, carry a lay of ashes on the grate.

Don't shake live coals into the ashpit.

Save all the good coal by sifting ashes.

Don't let ashes pile up under the grate.

Keep the damper partly closed.

Use the ashpit damper and the check damper to control fire.

Never open the fire door as a check—it is wasteful.

After the fire is well started, put on coal enough to last eight to twelve hours.

Burn off gases with checks open, before closing up a warm air heater for the night.

To bank the fire for the night, partly close the pipe damper, close the ashpit damper, and open the check draft damper.

Do not heat unused rooms.

Install weather strips or storm windows. and storm doors.

Let in sunshine; it is free heat.

Pull down the shades early in the evening.

Don't overheat the house; 65 to 70 degrees is sufficient.

Watch the weather, don't let the house get cold.

Ventilate wisely; use electric fans to circulate air.

What do you see when you go scurrying forth on a shopping errand? People's faces, and the crowded street crossings, and a glittering shop window or two?

Then I am tempted to turn into a fortune teller and prophesy: "Trouble will cross your path—and you will have a double chin!"

The chin is the first part of the body to show either age or lack of care—and a double chin means one of the two.

In youth every muscle of the body is exercised, the chin included; therefore the muscles are left firm and strong. As we grow older, our movements aer more restrained, and while arms and legs get a fair share of exercise, the chin sinks into absolute inactivity. There being thus nothing to exercise the muscles supporting it, they grow flabby and begin to sag. The only way to avoid this ultimate disaster is to keep the chin muscles firm by use, by exercise, and, where, necessary, by harmless artificial aids.

By use, I said. If you persist in letting your chin acquire the habit of drooping down or drawing in, your double chin is doubly assured. That is why, if you see only shop-windows and people's faces when you walk abroad, the fattest of double chins awaits you.

Try a new habit for your chin when it goes a-walking. Watch the skyline, not the pavement. If you are tramping along a country road, look above the tops of the trees, or off to the sunset, or away to the hills.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

Hay, Pressed, $18.00 to $20.00 per ton.
Straw, loose, 50c to 60c per cwt.
Straw, Pressed, $12.00 to $13.00 ton.

COUNTRY PRODUCE FAIRLY ACTIVE

Montreal, January 18

Receipts of fresh eggs continue to increase and the market is easier, Toronto jobbing price of specials was reduced during the week to 70c. Ontario country shippers report sales during the week at from 63c to 70c, f.o.b. Prices on the Montreal market are irregular, some dealers reporting sales of fresh specials at 78c, and 80c, while larger operators having heavier receipts, have sold specials at 75c, and extras at 70c to 73c.. On the farmers' market at Toronto the retail price was 80c to 85c. The scarcity of storage eggs and the fact that many wholesalers are completely sold out and have to depend on fresh receipts to supply their regular trade, is helping to hold prices at their present level. The United States offerings have not yet reached a point where supplies from there can be imported at a profit, but dealers here are looknig for a break any day now in that market, which will immediately affect the situation here. Very little change is reported on the Prairie Provinces and British Columbia markets, fresh receipts are light, and prices firm. Heavier receipts of Chinese eggs are reported and one car has been sold to the Alberta trade at 62c, f.o.b., Vancouver. recandled.

The feature of the local egg situation continues to be the strong undertone to the market for cold storage stock owing to the steady decrease in supplies available and the continued good demand for local consumption, and prices today scored a further advance of 1c per dozen, with sales at 57c to 58c. There was no change in prices for new laid eggs, but the feeling, if anything, is easy. The receipts today were 144 cases, as compared with 890 for the same day last week, and 165 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Fancy new laid eggs.....77c to 80c
Strictly new laid.....72c to 75c
Cold storage selests.....57c to 58c
Cold storage No. 1.....53c to 54c

Towards the close of last week a much firmer feeling developed in Eastern poultry markets. Receipts of live and fresh killed have increased, but they are still very light, which is not unusual at this season. The demand, while not large, has been ample to absorb all offering. For this week's deliveries most dealers have advanced their prices for all varieties. Western Ontario dealers, who shipped live poultry to Buffalo last week, report they netted the following prices: Chickens, 29c to 31c, fowl 29c to 31c, cocks 27c, ducks 33c.

Some important sales of storage poultry have been affected during the past few days, for future delivery and domestic consumption. Some cars have changed hands in Montreal and Toronto; the sales reported are: 360 boxes milk-fed chickens at 44c, 400 boxes milk-fed chickens at 46c, and a few hundred boxes of broilers at from 35½c to 37½c.

Canadain exporters state they have received some correspondence from British importers of poultry, which indicate the possibility of business if ocean refrigerator space is available. So far no actual sales are reported. A report from the United States says several large blocks of frozen chickens have been sold for export. Part of these have already been shipped and the balance will go forward as soon as ocean refrigerator space is available.

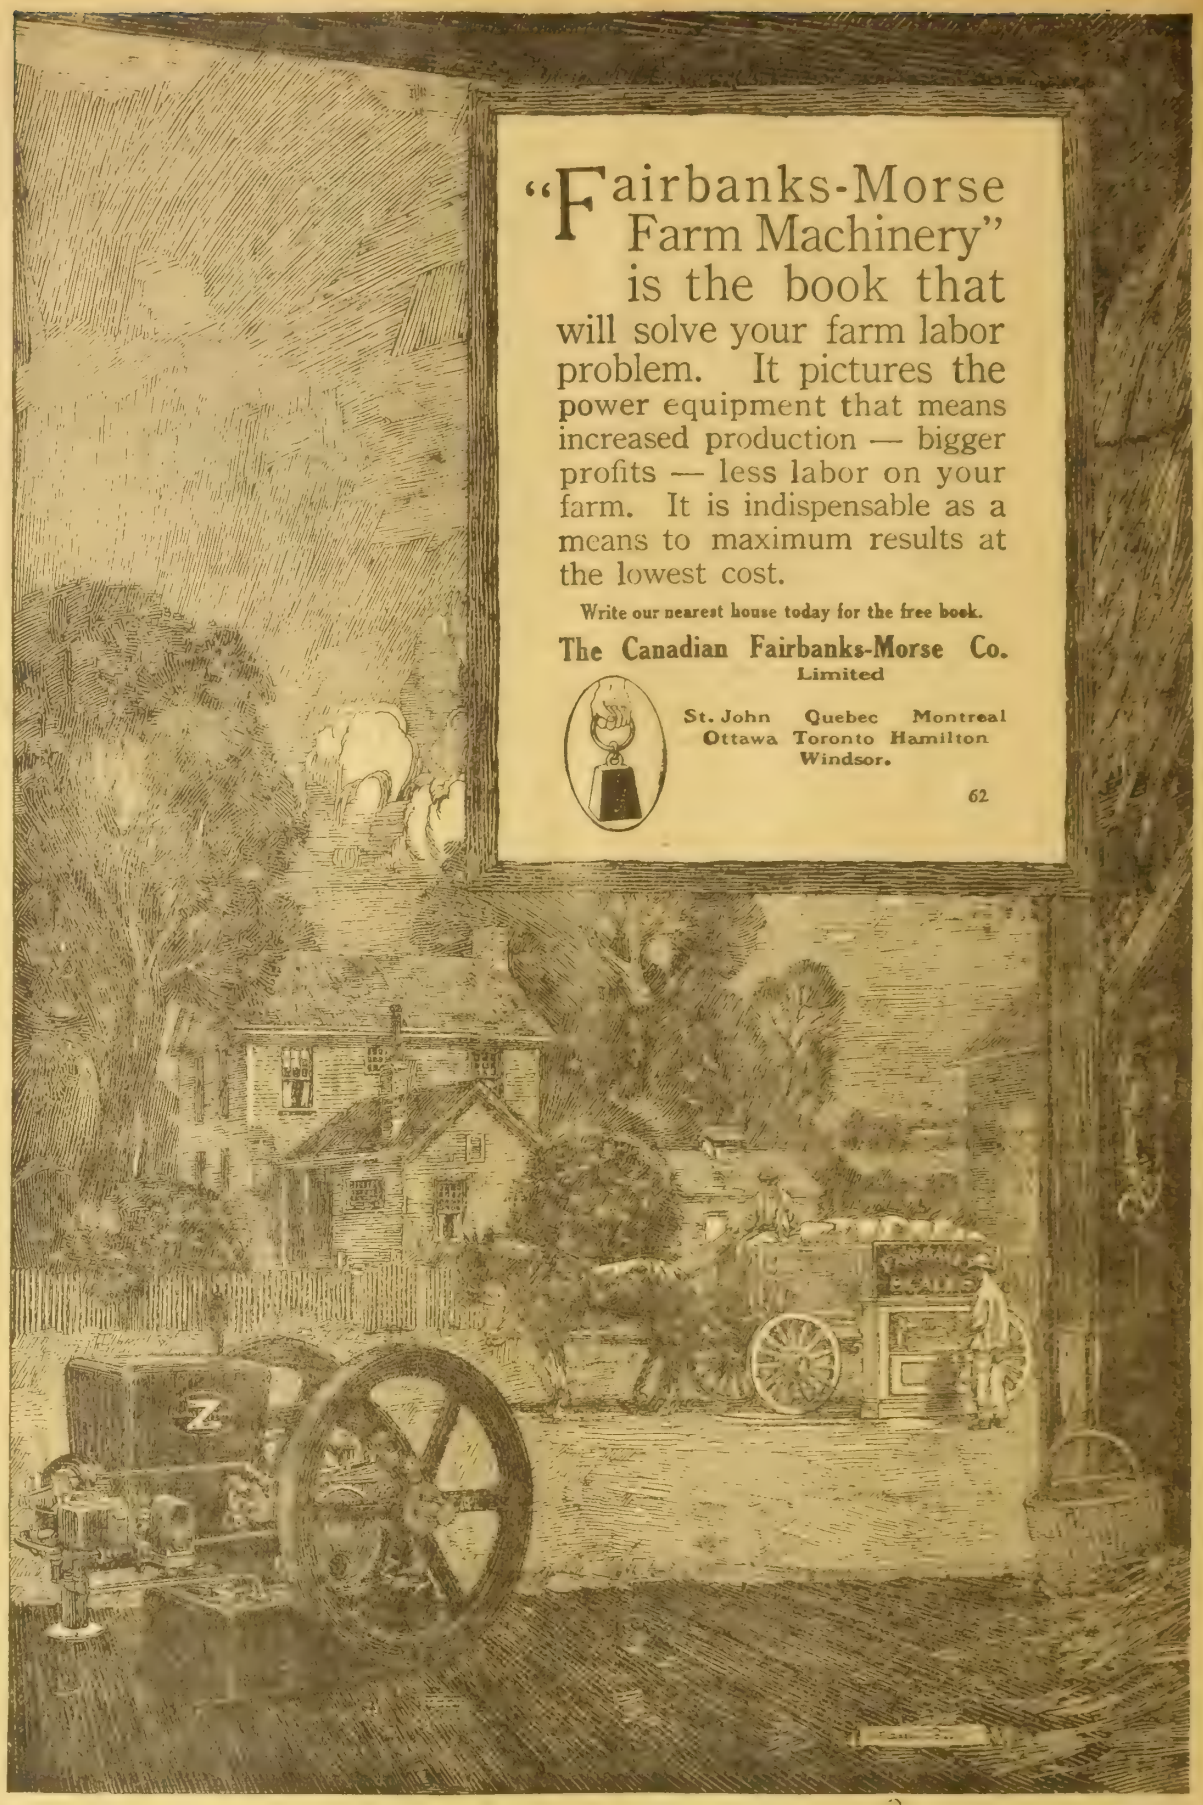
We quote wholesale jobbing prices as follows:

Choice turkeys, per lb.....42c to 43c
Lower grades.....32c to 33c
Milk-fed chickens.....32c to 33c
Ordinary chickens.....24c to 29c
Fowl .....24c to 28c
Geese .....25c to 26c
Ducks .....32c to 34c

The condition of the market for potatoes was unchanged, prices being steady, with a fair demand for small lots, and a fairly active trade was done in a wholesale jobbing way in Green Mountains at $1.90, and in Quebec white stock at $1.70 per bag of 90 lbs., ex-store, and car lots of Green Mountains were quoted at $1.75 to $1.80, and Quebec white at $1.35 to $1.45 per bag of 90 lbs., ex-track. The trade in Quebec turnips in a jobbing way is fair and prices rule steady at $1.25, ,and red onions are selling at $1.50 to $1.75 per bag of 70 lbs., ex-store.

DAIRY PRODUCE TRADE

Montreal, Jan. 18—The receipts of butter today were 41 packages, as



"Fairbanks-Morse Farm Machinery" is the book that will solve your farm labor problem. It pictures the power equipment that means increased production — bigger profits — less labor on your farm. It is indispensable as a means to maximum results at the lowest cost.
Write our nearest house today for the free book.
The Canadian Fairbanks-Morse Co. Limited
St. John Quebec Montreal Ottawa Toronto Hamilton Windsor.
62

ompared with 126 for the same day ast week, and 164 for the correspondng date a year ago. There was an inreased demand from local buyers for reamery butter today and quite a ew sales of 50 to 100 package lots vere made within range of our quotaions. The tone of the market is very irm, and higher prices are looked for ater on by some in the trade.

We quote wholesale jobbing prices s follows:

Finest creamery	53c to 54c
Fine creamery	52c to 52½c
Finest dairy	45c to 46c
Fine dairy	41c to 43c

The receipts of cheese today were 30 boxes, as against 221 for the same lay last week, and 243 for the corresponding date a year ago. A feaure of the local trade of late has been the increased demand for colored goods and quite a few fair-sized ots have changed hands, which has ended to strengthen the situation, nd holders of such goods have adanced their prices to 27c to 28c per b.

The following prices are being pair by the Commission:

No. 1 cheese	25c
No. 2 cheese	24½c
No. 3 cheese	24c

New York, January 15.—Butter, unettled. Receipts, 11,850 tubs. Creamery, higher than extras, 67¼c to 68c; creamery, extras, 92 score, 66½c to 67c; firsts, 63½c to 66c; packing tock, current make, No. 2, 43c. Cheese, steady. Receipts, 1,185 boxes. State whole milk, flats, fresh specials, 37c; do. average run, 35½c to 36c.

THE CATTLE MARKET

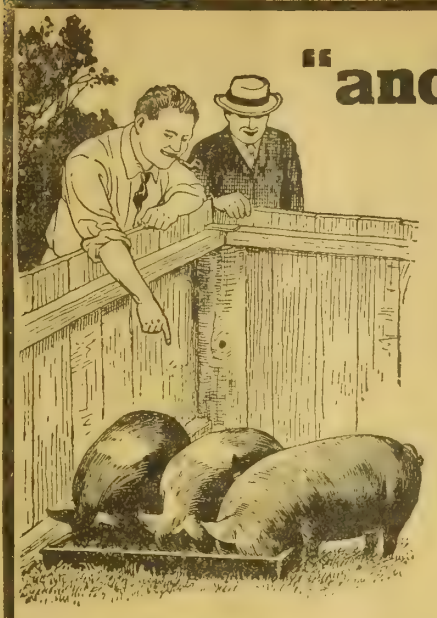
Montreal, Jan. 18—The feature of he market for small meats was the ontinued strength in sheep and ambs, and prices today scored a furher advance of $1.00 per 100 lbs., vhich was attributed to the smaller fferings and the keener competition etween local and American buyers or the same, and sales of Ontario ambs were made at $14.50 to $15, and ne extra choice lot brought as high s $16 per 100 lbs., while sheep sold t from $8 to $10 per 100 lbs. as to uality. The shipments of lambs to Boston amounted to 1,612 head. The one of the market for milk-fed calves was also stronger, and prices were $1.00 per 100 lbs. higher on account f the good steadp demand for this lass of stock, and sales were made of hoice veal at $15 to $16 per 100 lbs., nd stall-fed calves sold at $5 to $7. A weak feeling prevailed in the market for hogs, and prices in some instances were $1.00 per 100 lbs. lower han on Monday. The demand was nly fair, and sales were made from 17 to $18 per 100 lb. weighed off cars.

THE PROVISION MARKET

Live Hog Situation Unsettled and Weak at a Further Decline

Montreal, January 18.

A feature of the live hog situation was the decidedly weak feeling which prevailed in the Toronto market yesterday, and prices showed a decline of $2 to $2.25 per 100 lbs., since that day, week, with sales at $16.25 to $16.50 per 100 lbs., weighed off cars, and at $16 to $16.25 fed and watered. The Winnipeg market was unchanged at $15.50 per 100 lbs., for selected lots wighed off cars. A weaker feeling developed in the local market today in sympathy with the above, and sales in some instances were made at $1.00 per 100 lbs., lower than on Monday, and the range for selected lots was from $17 to $18 per 100 lbs., weighed off cars. There was no further change in prices for dressed hogs, but the undertone to the market was easy, with supplies ample to meet all requirements. The demand was only fair and chiefly for small lots owing to the unsettled condition of the market, and sales of country dressed sock were made at from $21 to $23 per 100 lbs.



"and they cost me less per pound gain"

CAN you imagine a manufacturer in the city feeding costly raw material into a machine without precise figuring of costs and the most careful selection? Can it possibly pay the "manufacturer" of bacon to feed hogs on the old-fashioned plan, without knowing the cost per pound gain? Decidedly not, in these expensive times.

Our experts have done the figuring for you. They have found out that certain feeds, combined according to known feeding values, will get a hog off to market in far less time, with more marketable, good, firm bacon on him, and at less cost per pound gain.

Monarch Hog Feed

is the cheapest feed you can buy—if you reckon by market results, and that is where your profits come from! Why try to figure out rations? Why worry about providing various feeds? Why waste precious time mixing up feeds? That was all very well when there was no such thing as Monarch Hog Feed available. Nowadays everything must be done expertly if it's maximum profits you want.

It's quality bacon that captures the best prices; Monarch gets the quality—good, firm, hard bacon—at less cost.

Monarch Hog Feed is a true balanced ration; it supplies every nutrient the growing hog demands—no more, no less. Its just right for maximum production, without waste of feed.

It has all the nutrient qualities of shorts, corn products and digestive tankage (rich in flesh-forming materials). Combined as a properly balanced ration they are easily digested; Monarch is palatable; hogs thrive on feeds they relish. Monarch can always be relied upon for best results.

Give Monarch Hog Feed a good, fair trial. Order a ton from your dealer; you can always depend upon getting it; should your dealer not be handling Monarch Feeds, send us his name and address, and we will see that you are supplied.

Monarch Dairy Feed
is a properly mixed balanced ration of oil cake meal and cotton seed meal combined with corn meal and bran; guaranteed analysis is 20% protein and 4% fat.

Sampson Feed
A general purposes feed with same ingredients as Monarch Hog Feed, excepting that oil cake meal is used instead of digester tankage; effective for both cattle and hogs; guaranteed analysis—10% protein and 4% fat.

Canada Food Board License, 6, 7 & 8. 11

BEATTY BROS. READY FOR 1919

The annual convention of the Canadian representatives of Beatty Bros. held at Fergus, Ont., Head Office of the concern was one of the most successful in years. Thirty-seven firm representatives from all parts of Canada were present and the foundation was laid for an energetic campaign of "B. T." products in 1919. At a banquet attended by one hundred and ninety persons much enthusiasm was shown. Among those present were the representatives from the Maritime Provinces who have returned with the idea that the only thing to do for the firm is to make "B.T." sales in the Maritime Provinces in 1919 the biggest on record.

SARNIA FENCE CHANGES HANDS

There has been a complete re-organization of the Sarnia Fence Company. Messrs. M. D. and M. H. Pendergast have sold their interests to Mr. Wm. Lottridge and Mr. H. Banwell, of the Banwell Hoxie Co., Hamilton, and Mr. James Playfair of the Great Lakes Transportation Co. The new concern will be under the management of Mr. Lottridge, who has had a very wide experience in fence manufacturing.

GRIND TABLE SCRAPS FOR CHICKEN FEED

"Table scraps and kitchen waste are best prepared for feeding by running them through an ordinary meat grinder," says H. W. Sanborn, extension poultry husbandman, U. S. D. A. "After the material has been put through the grinder it is usually a rather moist mass, and it is well to mix with some corn meal, bran, or other ground grain until the whole mass assumes a crumbly condition. All can be fed that the hens will eat up clean, and if any of the material is left after one-half or three-quarters of an hour it should be removed. If allowed to lie it may spoil and would be very bad for the hens."

POULTRY MAXIMS

It is urged that all farmers and poultrymen adhere strictly to the following principal rules in handling their poultry and eggs:

1. Keep the nests clean; provide one nest for every four hens.
2. Gather the eggs twice daily.
3. Keep the eggs in a cool, dry room or cellar.
4. Market the eggs at least twice a week.
5. Sell, kill, or confine all male birds as soon as the hatching season is over, so as to produce infertile eggs. The male bird has no effect on the number of eggs produced..

Most of our happiness comes to us through our activities in putting and keeping out of our lives those things which would make us unhappy.

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. **Furrow opens and seed drops in plain sight**—an equal distance apart, at uniform depth, with **absolutely no injury to seed.** Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.

Write for **free** catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. **In Stock Near You.** A success for over 20 years. Whether you are a large or small grower **—write today.**

SPECIAL ENCOURAGEMENT TO PURCHASERS OF REGISTERED SEED

Farmers who contemplate purchasing seed grain for next spring's sowing should keep in mind the advantages which thew may realize by purchasing Registered Seed rather than seeed which cannot receive any official recognition. These advantages briefly are as follows:

1. Registered Seed is more reliable as regards purity of variety, freedom from weed seeds and ability to produce a strong vigorous growth.

2. Registered Seed may be cvpected to yield from three to five bushels more per acre than ordinary unselected seed of the same variety

3. Crops from Registered Seed mature more venely than do those from unselected seed.

4. Grain harvested from a crop grown from Registered Seed may in turn be registered providing it is up to standard, if not more than three generations removed from "Elite Stock Seed" and that it has been properly inspected both while growing and while in the sack prior to shipping. Since registered seed brings more per hushel than does ordinary seed, the financial advantage which may be realized from sowing this kind of seed is obvious.

The ability to have immediate progeny of Registered Seed recognized as above mentioned is a new departure but is one which should appeal strongly to the average farmer. It frequently happens that farmers who have a particularly well prepared field desire to procure for it a supply of seed of outstanding merit. While Registered Seed is shown on such a field the chances of harvesting an outstanding crop are speciall good. Where such a crop is harvested it is a distinct advantage not only to the farmer himself but to the country generally to have the cleaned seed recognized and handled for seeding purposes rather than to be used for feed.

Fafmers who sow Registered Seed next spring and whose crops are promising during the groging season should apply to the Secretary of the Canadian Seed Growers' Association, 114 Victoria Street, Ottawa, Ont., to have their crops inspected before they are harvested. This inspection of the growing crop is absolutely essential to an official recognition of the thrashed grain.

FISH MEAL AS A LIVE STOCK FOOD

In these days anything that will increase the available quantities of cattle food without decreasing the quality is of immense value. Experiments have proven that this is possible with fish meal, a food stuff that as yet is little known in this country but which is used extensively in Europe. Fish meal should not be confounded with "fish scrap," "guano," or "pomace" or other forms of fis hproducts used as fertilizers. The fish meal used is more carefully treated and includes, or should include, only fresh, sound fish, or fish offal. The value of fish meal as a cattle food is explicitly set forth in four-page pamphlet No. 17, issued by the Department of Agriculture, Ottawa, and which can be had free on application to the Publications Branch. Results of experiments made at the Central Experimental Farm show that fish meal, where available, is a suitable concentrate for cattle sheep and for hogs; that fish meal contains 55% to 60% of protein, and over 15% phosphate of lime; that if of good quality and properly fed with other meals and with roughage, it is palatable, wholesome, and a good feed for young growing stock and also for milk production; and that if given a fair trial and used in proper proportions it should become one of the most popular and profitable protein supplements for swine feeding.

Growing Old Together

THIS aged couple, mellowed by time and the experiences of life, are happily growing old together.

They are happy because they are healthy. Life is still full of interest to them, and they are wide awake to new ideas.

These are the kind of old people that everybody likes. For, in spite of the years, they are cheerful and optimistic.

It is only natural that the blood should get thin and vitality wane as age advances, but there are ways of keeping up the quality of the blood and maintaining health and vigor.

Very many men and women have found in Dr. Chase's Nerve Food exactly what they need to restore energy and strength and keep them healthy and happy.

As an example Mr. Stephen J. Leard, North Tryon, P.E.I., writes: "At seventy-five years of age my heart gave out and became very irregular and weak in action and would palpitate. My nerves also became weak, and I could do nothing but lie in bed in a languishing condition, losing strength and weight. In that condition I began using Dr. Chase's Nerve Food, and am cured. Had I not obtained this treatment I would now be in the box with the roof over my nose. At eighty-one I have an energy which means go, and I am writing this letter so that old people like myself may prolong their health and strength by using this great medicine."

There can be no doubt that this treatment contained exactly what was required to build up Mr. Leard's system.

We are constantly receiving so many letters of this kind that we can, with the greatest confidence, recommend people of advanced years to put Dr. Chase's Nerve Food on trial, as a means of restoring and maintaining health and vigor.

Here is another interesting letter. This time from a lady:

Mrs. Joseph Lalonde, Hydro Glen, Ont., writes: "I have to thank you very much for what your medicines have done for me, especially the Nerve Food and Kidney-Liver Pills. I was so run down and nervous last summer that I was in bed most of the time, unable to do any work. I have also been troubled with my kidneys for over twenty years, and tried every doctor I knew of without any permanent results, but I can say that Dr. Chase's Nerve Food and Kidney-Liver Pills have made me feel quite different. Since taking this combined treatment I have been able to do my housework, and although I am now 76 years old, I feel better than I have for years."

("I know Mrs. Joseph Lalonde, and believe her statement regarding Dr. Chase's medicines to be true."—W. P. Flannery, Postmaster.)

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.50, all dealers, or Edmanson, Bates & Co., Ltd., Toronto. Only the genuine bears the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on every box.

CORRECT WAY TO WRITE A CHEQUE

It is interesting to notice how different people write cheques. Some are very careless about, taking no precautions whatever to protect themselves against the cheque raiser, the man or woman who makes the cheque call for more than it was intended. Experts say such carlessness results in the loss of millions of dollars annually to banks and individuals. In writing a cheque always take plenty of time and do it right. In filling in the space for the amount in numerals, make the figures plain, beginning close to he printed dollar mark so as not to leave a space for the insertion of another figure. Then write the amount in words, beginning with a capital at the left hand end of the line and after the amount draw a heavy line from the last letter of the word "dollars" at the right. If these directions are followed the cheque-raiser will not find it easy to take advantage of you should he gain possession of your cheque.

The Ontario Winter Fair is looking around for a new home where it will be able to expand and become International in scope. The proposed requirements are for a buliding that will provide accommodation for the following:

Horses	1500
Beef Cattle	600
Dairy Catttle	600
Sheep	600
Swine	600
Poultry	10000
Arena Seats	7000
Lecture Room	500

Dairy produce, 150 x 250 feet; seeds 175 x 250 feet; Judging Ring, 100 x 200 feet; and Dressed Meat and Killing Rooh, 100 x 200 feet.

FORD PRICES

The policy of the Ford Motor Company of Canada, Limited, to sell its cars for the lowest possible price consistent with dependable quality is too well known to require comment. Therefore, because of present conditions there can be no change in the price of Ford Cars.

THHE "FREE MARTIN" CALF

From time to time enquiries on the subject of "free martins" reach this office and biological explanations on their infertility are asked. There is yet a good deal of controversy even amongst recognized biologists, regarding the fertility of infertility of identical or nonidentical twins.

The cow generally produces only one ovum at each oestrum period; if two are produced and both are fertilized, then there is the condition of twins that are onidentical or not so very like each other in color and shape, and may or may not be of the same sex. Occcasionally, however, a single ovum will divide into two halves, like an egg with two yolks, and from each half a young animal is produced. In such a case identical twins is the result. Occasionally only amongst these is to be found a "free martin" or non-breeder. Prior to researches of Hart the "free martin" was believed to be an immature female a twin bull, but he has shown that one is a perfect male and the other an imperfect female, with often the external gentials like a female. Only on rare occasions is there found a "free martin" a twin to a perfect female.

The question of twins that are identical having only one fertile is not to be taken as a rule by any means. The writer heard it asserted that of twin bulls only one is normal and therefore, fertile, but that is a mistaken idea and one that any experienced cattle breeder can easily disprove. In searching the history of cattle breeding it will be found that many twin bulls were born and all of them fertile. The writer also knows of a cow that produced twins three times, all heifers, and all fertile and of twins of opposite sex both fertile. A "free martin" i seasily known! As a rule they never come in heat and their infertility can be noted by the time they are 15 to 18 months old. Either twin bulls or twin heifers are as likely to breed as are those that are calved at a single birth. Many eroneous opinions are abroad about the fertility of twin bulls, but men with experience and observation readily detect the infertile calf, while the average man will discover it practically before the animal reaches maturity.

The Canada Food Board has been informed that field and garden seeds have been removed from the restricted export list of the United States, and that American shippers in future do not require licenses for shipments of seeds coming into the Dominion.

The removal of United States restrictions on flour also extend to Canada.

The Scrub Sire

Canada's Great Handicap in the Race for the European Meat Markets

CANADIAN Cattle have, during the past few years, increased in numbers to a point where advantage may be taken of the tremendous market for beef opening up in Europe. During the war, our exports grew, but to maintain and increase our present trade means that we must make a determined effort to bring about a general improvement in quality, and to provide in volume, beef of the standard demanded by this market. To effect this improvement, it is necessary to

Do Away With Scrub and Nondescript Sires

The Scrub Sire has undoubtedly done much to prevent a more healthy development of Canadian Agriculture. He is responsible for economic losses amounting to millions of dollars annually, for lean pocket books, unpaid mortgages and for much of the discontent upon many farms.

Good bulls are properly cared for, but Scrubs generally run at large and roam the country at will. By-laws will not keep them within bounds, fences are almost valueless and the only effective remedy is castration. Many men who would be raisers of good cattle are powerless to prevent their inroads and become discouraged. They become a very real public menace and a heavy "drag" upon the Live Stock Industry. Every intelligent farmer to-day owes it to himself and to the cattle business of the country to

Use a Pure Bred Bull— Blood Counts!

"A good bull is more than half the herd, but a scrub is mighty near all of it." This statement made by a practical stockman is correct. In all animal life the tendency is to revert to lower levels, but by the use of good sires this is not only counteracted, but improvement will result because of the impress the sire makes upon the progeny. If the sire be a Scrub the tendency to go back is intensified and in a very few generations herds deteriorate and become absolute nondescripts.

That "Like Tends To Beget Like" has been proved beyond doubt. Many great herds carry the marks of some noted bull. Conformation, thickness and evenness of flesh, uniformity and quality may be stamped upon progeny by a good sire whereas the very opposite characteristics follow in the path of the Scrub.

The world's valuable markets are captured and held by cattle bearing the characters mentioned. The great beef-producing countries are the shrewdest and keenest buyers of high class bulls. The Argentine, one of our chief competitors, does not hesitate to pay the price and as a result is able to hold annually the greatest bull show in the world. They are valued because their progeny produces a high quality beef product which is in demand upon the world's best markets. It has been demonstrated that "It Pays to Pay for Quality." Canada's future depends largely upon the development of the Live Stock Industry, consequently, The Scrub Sire Must Go. Therefore,

conserve and build up the herds—improve quality—finish thoroughly.

Limestone and Slag as a Factor in Clover Growing

By W. Saxby Blair

The ability of legumes to secure nitrogen from the air is now so generally recognized that progressive farmers avail themselves of every opportunity to grow such crops wherever the maintenance of nitrogen is of importance.

In a series of tests conducted by Dr. Shutt at the Experimental Farm, Ottawa, it was shown that an area seeded to oats on which clover had been seeded on part of it, yielded the following years 10 bushels more oats per acre, and the year after 11 bushels more oats per acre than the adjoining plot not seeded to clover. That is, the clover growth resulting from seeding on May 5th to October the same year and plowed under was accountable for 21 bushels increase in the yield of oats in the two following years.

Dr. Shutt also found that a plot of ground on which the clover grown was allowed to decay and turned under every two years and reseeded, gained 308 pounds of nitrogen per acre in 5 years, or over 60 pohnds each year, or equal each year to the nitrogen contained in 400 pounds of nitrate of soda, costing at the present time approximately $6.00 per hundred, or equal in value to $24.00 per year at present prices.

A 35 year test conducted at the Pennsylvania Experiment Station with a rotation of corn, oats, wheat and hay, the hay being a mixture of clover and timothy with clover predominating in favorable years, and by using what would correspond to 300 lbs. acid phosphate and 200 lbs. muriate of potash per year the crop produced averaged 52 bushels corn, 42 bushels oats, 19 bushels wheat and 2 tons hay per acre and the yield not decreasing. The explanation is that the nitrogen is furnished from the air through the clover nodule organisms on the roots. In a similar test conducted at Wooster, Ohio, covering a period of 25 years cropped and fertilized similar to the above, it was found the crops removed contained 1100 pounds of nitrogen. No nitrogen having been added, the nitrogen must have been largely supplied through the clover.

Tests made at the Experimental Station, Kentville, have revealed the fact that on many of our lands clover cannot be grown without an application of limestone or slag. An area of 8½ acres was divided into seventeen one half acre plots, the whole being fertilized alike as to respective duplicate areas, except that ground limestone was added to one, slag to another and slag and limesone to another, and one plot left in each series without any of these materials. The land was seeded to Banner Ooats and grass seed in 1917 at the rate of 8 pounds Red Clover, 2 pounds Alsike Clover and 8 pounds Timothy per acre. The average yield from the plots was as follows:—

EFFECTS OF AN APPLICATION OF 4 TONS LIMESTONE PER ACRE

The above illustration shows the effect of an application of 4 tons limestone per acre applied in 1914 to an area where it was proposed to grow alfalfa. This is a poor sandy area, which was never manured and the crop was not large. The alfalfa failed to winter and the land was seeded to wheat with clover and timothy. The limed area produced practically clear clover, and the unlimed area clear timothy, although each were seeded with the same seed. The product shown was taken from the same sized area.

	Yield per Acre Straw lbs	Grain bus	lbs
Slag ½ ton, average of 4 plots	2898	42	22
Slag ½ ton, lime 2 tons, average of 4 plots	3119	44	7
Lime 2 tons, average of 4 plots	2570	42	15
Check, average of 2 plots	1995	39	31

There was a striking difference in the yield of hay in 1918 which was as follows:—

	Yield per acre lbs
Slag ½ ton, average of 4 plots	3996
Slag ½ ton, lime 2 tons, average of 4 plots	4615
Lime 2 tons, average of 4 plots	4560
Check, average of 2 plots	2480

It would appear from the above that in addition to slag furnishing phosphorus, it is valuable because of its lime content.

The clover plants on the check plots which were unlimed and on which no slag was used but otherwise treated in a similar way were poor, and lacked vigor, the increase in yield being due to the clover growth entirely. The yield from the slag plots over the check plots was 1516 pounds, and the limed plot was 2080 pounds greater than the check plot.

Interesting results were obtained in an orchard fertilizer experiment where 150 lbs. of nitrate of soda was applied per acre, and in addition on one plot acid phosphate at the rate of 350 pounds was used, and on another 500 lbs. of slag, and one plot with 500 lbs. slag and no nitrate of soda, the fertilizer being applied in 1913, 1914, 1916 and 1917. The yields were as follows:

	Slag	Nitrate of soda & slag	Nitrate of soda & acid phosphate
	bus lbs	bus lbs	bus lbs
1913, Potatoes	160	196	195
1914, Oats	33	54 4	58
1915, Hay	6987	9521	4900
1916, Potatoes	183	198	173
1917, Wheat..	19	26 30	17
1918, Hay	2730	3660	1485

The results would go to show that the tendency of acid phosphate is to make the soil acid and unsuitable to clover. The slag on the other hand, owing to its lime content, evidently makes the soil suitable for clover. Certainly the poor clover yield was not due to lack of phosphorus, as the 350 lbs. acid phosphate would furnish as much of this element as 500 lbs. of slag. It should be kept in mind that no manures had ever been used on this soil, and this represents the fertilizers applied and crops produced since it was cleared from forest.

In 1914 a series of tests were started using five different combinations of fertilizers induplicate plots, limed and unlimed, and in addition unfertilized plots limed and unlimed were left as a check. The ground limestone was applied at the rate of 2 tons per acre. The largest amount of fertilizer used on any of the plots did not exceed 550 lbs. per acre. The fertilizer and lime were applied in 1914 and 1917 only.

Owing to the crop being so poor in 1916, the land being a sandy loam containing very little humus, it was considered advisable to use 15 tons stable maure per acre over the whole area, treating each plot in the test alike. This was applied in the fall of 1916, and the fertilized and limed plots were treated in the spring of 1917 in the same way as in 1914 The yield given below is the average from the fertilized limed, and fertilized unlimed plots The crop produced was as follows:—

		Yield per acre bus	lbs
1914	Potatoes, limed and fertilized	86	45
	Potatoes not limed but fertilized	76	13
	Potatoes limed and not fertilized	67	35
	Potatoes not limed and not fertilized	55	55
1915	Oats, limed and fertilized	38	14
	Oats, not limed but fertilized	31	24
	Oats, limed and not fertilized	32	27
	Oats, not limed and not fertilized	30	15
1916	Hay, limed and fertilized	1494	
	Hay not limed but fertilized	666	
	Hay, limed and not fertilized	1120	
	Hay. not limed and not fertilized	720	
1917	Potatoes, limed and fertilized	329	18
	Potatoes, not limed but fertilized	302	25
	Potatoes, limed and not fertilized	313	25
	Potatoes, not limed and not fertilized	251	50
1918	Wheat, limed and fertilized	2626	30 14

		Straw lbs	Grain bus	lbs

N. S. Fruit Growers Annual Convention

The big meeting of the year in the Annapolis Valley is the N. S. Fruit Growers Association. Hither, during the month of January, flock all the more progressive growers from the boy of sixteen to the veteran of four score or more, all eager to learn the latest results in successful fruit raising. This gathering has become the recognized clearing-house of the year's accumulated experience of the best growers in the Valley, and the results of the different Experiment Stations, both Provincial and Federal that are carrying on work among us.

The talent gathered this year oy the secretary to lead the discussions was of a very high order, and the interest was well maintained throughout the entire session.

The two speakers from a distance who attracted the most interest were Mr. Samuel Fraser of Genesco, N. Y., and Mr. C. W. Baxter of Ottawa, the new Dominion Fruit Commissioner. Other speakers were Principal Cumming of Truro; Profs. Blair, Saunders, Brittain, each of whom contributed his share to make the Association one of the most notable in its long history.

President F. H. Johnston in his opening address called attention to the lifting of the embargo against apples entering the British market, and spoke most hopefully of the fruit industry. On account of the high railroad rates which our Western competitors are obliged to face, N. S.'s close proximity to the seaboard, the temporate climate and excellent soil conditions which this province enjoys, and in view of the ncreasing difficulty with which apples are raised in all countries, he thought that there need be only the largest optimism over the apple situation, closing his admirable address by urging all to do their utmost to increase their production during the coming year.

The new Fruit Commissioner who made a splendid impression upon all in this his first visit to our Association in his official capacity, expressed a hope of being able soon to inaugurate such a system of inspection as would enable the grower to sell all of his fruit on an f. o. b. basis.

This announcement was received by all present with the greatest of satisfaction, because the lack of such inspection has been a serious handicap to the fruit industry in the past.

A very important paper on Commercial Strawberry Growing was read by Mr. Manning Ells, who after seven years of most efficient service as Secretary of the Association, is now retiring on account of other more pressing business duties.

Mr. Ells called attention to the fact that the demand is increasing each year, while the supply is yearly decreasing; that N. S. crop is a little earlier than N. B.; that strawberries can be easily grown and that there is now a better distribution than formerly.

Mr. Ells paper, though at the end of the session, was well received as coming from a man who perhaps has done more than any one else to put strawberry raising on a safe foundation.

A large portion of one session was devoted to a discussion of the proposed raise on express rates, and other transportation problems.

The discussion was most opportune because of the presence of Mr. Geo. E. Graham, the General Manager of the D. A. R., whose interest in the work of the Association is very keen.

After a full and frank discussion of all the points involved, Mr. Graham answering all questions put to him in a most courteous manner, a committee was appointed by the Association, whose duty it shall be to investigate all freight rate unequalities, and have them adjusted as soon as possible.

In the matter of express rates, notice to advance, which to the extent in many cases of 50%, has been given by the erpress companies. A strong committee was appointed to prepare the Fruit Growers case and forward it to the Railway Commission for their consideration with a view to a more equitable adjustment.

But the Association is sustained more especially because of its educational features; it's members are more largely concerned at present with the production of a first-class commercial product, and are content to leave the problems of transportation and the securing of better markets, etc., to organizations whose particular business this is. Hence the chief interest of the Association centres about the deliverance of our spraying specialists, since spraying is seen to be the most difficult problem which confronts the successful fruit grower.

This year the Spray Calendar as issued by Prof. Britain and Saunders, makes a most radical departure. So much damage has been done to the fruit industry by the Lime-sulphur, that it has been wholly abandoned as a spray except as a third spray, where a modification of soluble sulphur is recommended instead, on account of the russetting which Bordeaux causes at this time.

But even the old Bordeaux has been modified so that instead of using the well-known 4-4-40 mixture, the 2-10-40, now known as the Thompson mixture, is recommended. The hope was expressed by Prof. Saunders that the spray calendar as now worked out will remain substantially as it is for a number of years.

The resolution of last year urging upon the Government the need of a law making compulsory the grading of potatoes, was reaffirmed.

The Tractor also came in for a considerable attention at the Association a number of short addresses being devoted to it. The consensus of opinion seemed to be that the tractor had not get reached a stage of development where it was a safe proposition for the average orchardist.

A very pleasing feature of the Association was the presentation to the Association of a gavel made from the trunk of an old French apple tree. The gavel was made in the form of an apple, and is a most welcome addition to the paraphalia of the Association, as up to this time the meetings have had to be conducted without the use of one.

Col. Chippy Spurr, though well past the four score mark in life, was present at all the sessions, participating in many of the discussions.

All regretted the absence of veteran Fruit Grower Robert Starr, who for more than half a century has scarcely missed a meeting, was not able to be with us.

The Association elected for its officers for the ensuing year:

President—Rev. H. S. Shaw.
Vice-Pres.—V. B. Leonard.
Secretary—F. W. Foster.

ORCHARD CULTIVATION

By Prof. W. S. Blair, Experimental Station, Kentville, N. S.

The management of orchard soils so that the trees can do their best, requires no small amount of thought, and probably no part of our orchard work has been given so little thought as this during the past few years. It seems there is no one best way of managing an orchard. There may be several good ways, and because a certain method may suit certain conditions best, does not mean that such a method can be adopted universally and prove successful. If we could but realize that conditions do vary for every person who grows fruit, and that there must, therefore, be more or less diverse ideals, diverse mthods and diverse results, it would help toward a better understanding of the cause for the many local differences in respect to methods. It seems reasonable, however, that there should be some certain practice, if followed up consistently, which will prove most satisfactory over the greatest range of orchard soils and under varying climatic conditions.

It may not matter much whether clean cultivation, cultivation and cover crops, or sod mulch is practiced in orchard management, provided certain conditions are met. The first thing, therefore, is to determine the conditions which are best suited to the tree. We all know that heat is necessary for well colored and well matured fruit, and that some varieties require much more heat than others to mature properly, heat being in some cases a determining factor as to whether a variety is a commercial success in certain places. Soil temperature may be modified by the moisture condition of the soil and for that reason a variety may do better on some areas than on others, the atmospheric temperature being the same in both cases.

Soil moisture as we well know, is a large factor in the success or failure of any crop. Not only has moisture an important part to play in the liberating and transporting of plant food, but when reduced below a certain point plants suffer as do animals for the want of it.

You know from your own observation that plants under certain atmospheric conditions will transpire much more moisture than under others; on dark, cool, calm days it is not nearly so great as during bright, hot, windy days. You also know that the moisture condition of your land is determined to a very great extent by the nature of the subsoil; that in general a cool, heavy, close subsoil is not satisfactory for fruits, and that, on the other hand, an open subsoil is unsatisfactory. We have very little of the latter in this Valley, for the most of our subsoil, while gravelly enough to permit a good drainage, is mixed with finer materials, giving good water holding capacity and favours a good moderate capillary flow of soil waters from the subsoil to the surface, giving what might be termed ideal fruit soil. It is this condition, coupled with natural wind protection, both of which influence the moisture supply which makes this Valley a good fruit country.

In the growth of fruit trees as in other plants, two distinctive forces are at work, one the vegetative, the other the reproductive. Any checking in the vegetative growth tends to reproduction, but, at the same time vegetative vigour is necessary if satisfactory production of fruit is to take place. Excessive vegetative growth tends to wood and foliage growth at the expense of reproduction. In the case of an orchard making an excessive vegetative growth, a June plowing to the extent of a severe root pruning may throw the orchard into fruiting, wheeras such plowing in an orchard low in vitality may prevent the tree from secuirng the nourishment necessary to develop vegetative growth sufficient for proper production development. In addition to the building up of wood tissue, and the development of twigs and buds, together with reserve food material for another year, fruit is also being produced by the tree. Therefore, to encourage such growth as will maintain vegetative vigour, give good strong fruiting buds for the next year's crop, and well developed fruit all at the one time is no small undertaking, and to devise a set of rules to guide one is a difficult task, for with variable factors, such as soil temperature, soil moisture, amount of plant food, insect and diseases, any one of which may modify results, the problem becomes complicated, hence the aim should be to preserve an even balance by attention to certain operations so that moderate and constant vegetative vigour may be maintained as fully as possible, and this in turn will likely give moderate and constant production. It is well known that moderate vegetable growth is necessary if we are to have healthy branches to produce strong fruit spurs to carry and nourish large crops of well developed apples.

Nature has arranged matters so that the different processes in plant development may occupy certain periods. The most active vegetative growth—the development of leaves and twigs—takes place in the early spring, and the development of fruiting buds takes place later, along with the storing up of the materials necessary to start the tree into growth the following spring. It can quite readily be seen, therefore, that any retarding of development in the spring may mean a serious loss in retarding development of the reproductive processes in the late summer, hence the importance of aiding nature that vigorous growth may take place during the normal growing season, so that the later processes which make for production may continue unhampered.

The fact that a fruit tree has deep running large roots may lead up into the error of supposnig we can grow a crop on the surface soil and not interfere with the development of the tree. That the coninuous cropping and removal of an early growing crop such as grass is decidedly unsatisfactory in ultimate results as to fruit we know to be true. Yet it is possible that a much heavier crop of millet or other crop may be secured from the same area during the late summer, without lessening the crop and may in fact, increase ultimate production, the reason being that in the first case we have checked the vegetative growth at the very time it should have been stimulated, and in the other have helped to check vegetative growth when a check was desirable and aided the reproductive processes, so, while it may not be desirable to crop an orchard in the early summer, it may be desirable to do so in the late season, and it is because of this fact that early cultivation followed by covercropping is practiced.

Those of you who have had to do with garden crops know something of the effect on the crop of an early hoeing, even if no weeds are present. You work up the soil and in a day or two you are surprised at the growth.

You have aided nature and produced conditions of aeration, heat and moisture suitable for the plant and soil organisms which aid in plant food development.

The first fundamental necessity, therefore, in orchard practice is an early working of the soil. It is a fact that many of our growers delay this operation too long in the spring, notwithstanding the fact that orchard lands usually are fit to work before other farm lands. As stated at the start there may be cases where late plowing will work to advantage, but on general principles it is wrong entirely and cannot, except in certain cases, be carried on to advantage.

Early cultivation promotes active root development because of the soil earlier becoming warm; air penetrating it more deeply, and more uniform moisture conditions having been brought about. Fibrous roots are formed very earily in the spring from materials stored up in the tissues of the tree the previous season, and surely there is no advantage in destroying these making it necessary for the plant to draw upon materials which should be used for other purposes to develop new roots. It is natural for this early fibrous root growth to be made near the surface for there is the availabe food, heat, and air suitable for early spring growth, hence delay in spring plowing may defeat the very object in view and the orchard be no better than if not plowed at all.

Moderate plowing is best and it should not be more than four inches close to the base of the tree, otherwise bracing roots will be injured. I do not see that much of the close plowing practiced is desirable. True it makes the plantation look nice, but to clip the grass several times close around the tree would not take much time and would look about as good. However, I like to see things looking nice and you can plow close, but do not plow as deeply as you generally do. The only reason why so many of your orchard trees are leaning is that you have cut off th bracing roots. The side from which a bracing root has been cut, or injured, is affected thereby, owing to normal sap flow having been cut off. I believe there are many orchards that would be better producers if sod mulch was practiced in place of deep late plowing practiced. This does not say, however, that the sod mulch is the best method, if plowing and cultivating is properly done.

The second fundamental necessity in orchard practice is shallow cultivation after plowing. It is necessary to cultivate deep enough to produce the fine earth mulch. It should be done often and shallow about two inches. You thereby give the feeding roots a chance to get to where they can get the food you have supplied. It does not make any difference to you if later on these roots die in the surface soil for want of moisture, because in going after what they were intended for early when the tree wanted it the most, they performed their part.

It was in 1904 that I pointed out in an address before this Association the importance of early spring cultivation. In your 1905 report you will find experimental data secured during that season, showing that land plowed on May 13th, contained on August 4th, 15.10% of moisture and that plowed May 26th, two weeks later, cotnained on the same date 9.49% of moisture, a difference in favour of early plowing of 5.61%, or 132 tons more water to the acre to a depth of 14 inches. We are told by those who have studied the matter that when the soil moisture falls below 12% the tree fails to function properly. Early plowing may not appear to you to amount to much, and certainly in seasons of heavy rainfall it would not amount to as much as in dry seasons, but it is because we cannot determine the character of the season beforehand, and that the season influences subsequent crops that we should not take a chance, but adopt what will in the long run give the greatest returns.

Experiments conducted by the writer in 1905, the year before going to Macdonald College, indicated a soil moisture content of 8.08% on July 17th, where clover was growing, as compared with a similar plot on which the clover was cut when 12 inches high and allowed to remain as a mulch, which on the same date contained 11.77%. An adjoining plot at the same date cultivated four times to June 15th and seeded to a cover crop contained 13.89%, and another plot cultivated 6 times and seeded to a cover crop on July 20th contained 15.65%. The difference between the clover uncut and clean cultivation on July 17th was 7½%, on the 2nd August it was 8.25, August 15th 8.20, ranging on August 30th from 5.91 on the sod to 14.11 on the area seeded to cover-crop July 20th, a difference of 213 tons in favour of cultivating, and yet the rainfall during June and July was nearly 5 inches. The point is, can your fruiting trees do as they should if the soil contains only 5% of moisture, and is it possible for the fruit buds to be developed and the fruit as well under such conditions? Nature will develop the fruit because the natural thing is to develop seed so that the species may carry on. So I say, do not take a chance, but rather adopt methods which are fundamentally correct from every angle you may look at it, and I may say the only method we can pin our faith to covering a wide range of conditions.

I have no quarrel with the sod mulch man, but, as pointed out above, in the case of the clover growth cut when 12 nches high on June 16th and again July 6th and left on the ground as a mulch, the moisture content of the soil on August 15th was 5.64, as compared with 14.11 on the area clean cultivated to July 20th, a difference of 225 tons of water to the acre to a depth of 14 inches. Had there been a heavy mulch I can quite readily understand that the moisture conditions would have been different, for without a doubt the success of sod mulch is largely depndent upon the mulch supplied, in this case it was equal to 2½ tons of hay, but this was not sufficient to give the protection necessary to prevent the drying out of the soil. The success, therefore, of mulching, provided sufficient plant food is supplied, is dependent largely upon the control of the moisture supply. If reasonable water supply is assured there is no good reason why it cannot be practiced, but too light mulching may not give proper summer moisture, and if too heavy, the too abundant fall moisture may prove injurious. The natural moisture conditions of the soil, or its ability to obtain a moderate supply by cappilarity, is a big factor. I have in mind two orchards at Abbotsford, Quebec, both owned by one man and situated on boulder soil where it was about impossible to cultivate and where the practice of cutting the grass with a scythe several times was followed. The upper one had not been profitable. The low r one was profitable. One had a stunted, ill-nourished appearance and the other looked healthy, and yet of the two the upper orchard had been fertilized the best. I ventured the suggestion that his whole trouble was due to lack of summer moisture in the upper orchard, and to find out took with me several soil samples to a depth of 12 inches on the middle of August, to find out the moisture content. The analysis revealed the fact that the lower orchard contained 16.42% and the upper one 8.21% of moisture. Another case I have in mind is a small orchard from which grass was always cut, yet which remained healthy and productive, and the soil of which was always moist. Along the edge of this orchard a small stream flowed continuously feeding water into the soil, making up for the loss of moisture due to the drying out resulting from the growth of the grass and trees, and giving ideal moisture conditions for growth. I mention these observations to point out that situation may have a lot to do with the success of a method of orchard management.

A five years test conducted by Professor U. P. Hedrick of the New York Experiment Station, comparing the sod-mulch and tillage methods, shows that the cost of production on the sod mulch was $53.75 per year and on the tilled $76.06, an advantage of $22.31 in favour of the sod mulch, but the net income from the sod-mulch was $71.52 and from the tilled acre $110.32, an advantage for tillage of $38.91.

In tests made in August at Macdonald College the soil under a mulch so heavy that no grass grew, contained 18.12% of moisture, and the adjoining plot in grass from which the grass was cut when 6 inches high and allowed to dry, but which gave very little protection as a mulch, contained 11.95%, and the plot allowed to grow and cut for hay contained 6.11%. A plot cultivated and seeded to crimson clover contained 16.16%, and the clean cultivated plot without cover crop 16.31% of moisture. The old orchard of Fameuse, never cultivated and the grass always kept cut every two weeks with the mowing machine, and lightly dressed with manure each spring, contanied 10.84% of moisture at the same time.

It should be kept in mind that, in addition to moisture removed by the growing plants, large amounts are lots from the surface of the soil by evaporation. The principal object of cultivation is to conserve this and, at the same time, of course, prevent growth of weeds or grass which would not only take up moisture but plant food as well. It will be seen at once that an orchard with a dense top throwing much shade would materially lessen the evaporation from the surface soil, and for this reason the problem of moisture control may be quite different in various orchards.

The matter of cover-cropping must be considered if we are to obtain best results. As pointed out, it may be objectionable to have excess of moisture late in the summer, for late vegetative growth may be the result. The cover crop will prevent this and, at the same time, hold excessive plant food which might be lost during the late fall, and produce material necessary to turn under to form humus. Too early seeding of a cover-crop may not be desirable. In one instance a cover crop seeded June 15th seemed to dry out the soil too much early in August, the soil on this plot containing only 7.87% of moisture, whereas a similar cover crop seeded July 20th reduced the moisture to only 14.11%. It should be kept in mind, however, that the soil on the late seeded plot was cultivated on July 6th and 20th, which of itself would help to retain the moisture. The fact is, nevertheless, that cover crops have a very drying effect on the soil, and it is because of this fact that they are so valuable in helping to check late growth and promote better ripening of the wood and maturity in fruit buds. Results of tests at Macdonald College show the following moisture cotnent of soils late in September seeded to various cover crops at the same time:

No cover crop	14.9
Crimson clover	12.7
Red Clover	12.3
Timothy and Red Clover	11.9
Buckwheat	11.6
Winter Rye	11.6
Rape	10.1
Oats	10.0
Oats and Clover	10.0
Millet	7.24

To reduce the moisture in soils during June, July and early August is not wise, as it not only prevents proper nourishment, but as a result of the drying out of the soil, the soil temperature is raised to a point that prevents the roots from functioning properly, and a serious check to the tree results. To reduce the moisture content in September as pointed out, may be of great advantage, as usually there are excessive rainfalls at that time, and an excess with the ground warm may cause an undesirable second growth, particularly if the trees have been checked too early, and the wood prematurely ripened by dry weather during July and early August. The time for seeding a cover crop may vary according to the crop used. It seems unwise to seed before the 15th of June in any case, and seeding later than the 15th of July is usually not advisable.

It would appear from work done by the writer at Macdonald that red clover seeded about the middle of June is a good practice. This crop requires a long period to get started and if seeded late makes very little growth, but if seeded in June at the rate of 8 to 10 pounds per acre, a strong growth can usually be had by fall, and as for collecting nitrogen, it is the best of all the crops I know of. As stated to your Association two years ago, an application of 2 tons ground limestone per acre is necessary on most soils to produce conditions suitable for its growth. Crimson clover makes rapid growth and seeded at the rate of 15 to 20 lbs. per acre early in July will give a heavy math of material for plowing under in the fall. Vetch is one of the standard cover crops and it certainly has many advantages. It will grow on soils much more deficient in lime than the clovers, and will start under more unfavourable soil conditions as the seed being large it can be harrowed in more deeply to where there is sufficient moisture to germinate the seed at once. Seed is difficult to get at reasonable prices at present, owing to the former supply from Russia having been cut off, but it has the advantage of being a crop from which we can get our own seed by seeding a small area early in the spring. It is usually seeded at the rate of one bushel per acre.

Buckwheat is the crop most generally used and it has many advantages, but does not trap any atmospheric nitrogen like the clover and vetch. Oats are good and an excessive growth may be useful for stock feeding if the ground is in good condition. Millet loves heat and a very rapid growth will be made on dry soils and as indicated above, no crop dries out the soil so rapidly as does this one. Rape is anotner crop that may be used to advantage and like oats and millet may be used for stock feeds if too heavy a growth for turning under is made.

In my mention of early spring plowing, I do not wish it understood that we think fall plowing is not advisable. We believe that plowing should be done in the fall if at all possible and the ground well worked with a disc harrow as early as it can be worked up in the spring. If the orchard can be worked with the disc without plowing at all, so much the better.

A reader of The Rural New Yorker insists that when a plum tree fails to bear he can always bring it back to fruit by boring a hole into the trunk and poking in a quantity of sulphur. Now the usual reason for these barren trees is that the flowers are sterile and thus rarely if ever fertilize. The remedy is to plant trees of another variety near by, or graft wood of that variety into the barren tree. Then the flowers are fertilized and fruit is formed. How can the sulphur poked into the trunk of the tree, make a sterile flower fertile? This is a good illustration of the way some of us mix up cause with effect. A certain thing happens, and without hunting out the true cause of it, we oserve that another thing seems o change he first one. It may be an accident, but we jump to the conclusion that it is a true remedy. You never can have a true remedy until you find the true cause. The politicians are always strong at mixing up cause and effect by claiming that the party is above the people.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

Contract rates on application.

April	1-22
May	6-27
June	10-24

FEBRUARY 4, 1919.

CATTLE FEEDING

Readers of The Maritime Farmer should preserve the second January issue of the Maritime Farmer for future reference. Th subject matter of a bulletin by Prof. J. M. Trueman of the N. S. A. C., Truro, on "Cattle Feeding in Nova Scotia" was commenced in that number and is continued on other pages of this issue. Prof. Trueman is one of the foremost authorities on feeding questions and live stock in Canada. Thousands of dollars are annually spent by the farmers of Maritime Canada for mill products for feeding purposes. Are they spending their money to the best advantage? Study the recommendations of a practical authority. See where his recommendations can save you money and help you to get better results from your herds.

GROUND LIMESTONE AND BASIC SLAG

The attention of Maritime Farmer realers is directed to an interesting article on another page of this issue dealing with the results of experiments with Ground Limestone and Basic Slag, conducted by Prof. W. Saxeby Blair, Superintendent of the Dominion Experiment Station, Kentville, N. S.

This is a timely article that every farmer should read. Coming from Prof. Blair, who has had a long training in the school of experience, it will shed a fund of valuable information on the live question of the comparative value of the two commodities under discussion.

We would like to get letters from farmers who have used ground limestone or slag in their farming operations, as to the results they have been able to procure.

We frequently hear some very good recommendations for slag and also for ground limestone. Let us have some for publication.

LOSSES DUE TO CONTROLLABLE DISEASES

Among the diseases of economic plants there exist some for which effective control measures have not yet been discovered. Besides these are a large number where control is possible, but only after persistent efforts extending over a number of years. And finally there are a goodly number that readily respond to measures of control.

If we take into consideration the enormous losses resulting from plant diseases every year wherever farming and fruit-growing is an industry of importance—as in Canada—then it will be realized that negligence and indifference towards the control of such diseases as can actually be controlled, are causes of great national loss.

The person causing a forest fire through negligence or carelessness, renders himself liable to prosecution and a deservedly heavy fine, yet it is rarely that the culprit himself is the loser; the loss is debited to the whole nation owning the forests. In allowing plant disease to persist and become widely prevalent, persons are similarly guilty of criminal neglect, particularly at this time when the question of food is of far greater importance than all the gold in the world. Yet though Canada as a nation is the prime loser through the cumulative effect of such waste in production, other nations, now so markedly dependent upon Canada as a source for the necessaries of life, also suffer in consequence. Moreover it is not a commercial question of sharying in the loss and thus reducing it, but one of having to do without food which is lost through negligent members of a community.

Grain Rust causes annually millions of dollars loss. This can only be reduced by certain safety measures, but cannot so far be controlled. But the same grain that has escaped the rust is yet very seriously reduced in yield by smut diseases. In some years smut, quite apart from rust, has caused losses amounting to more than twenty million dollars in Canada alone. Smut of grain is a disease that is easily controlled by the very simple and highly effective means of seed treatment. Either from ignorance or from negligence, smuit is still widely prevalent. Only this year were received reports of smut affectnig one field up to 80% and more. Another example of a disease causing severe damage, but which may be readily controlled, is Late Blight of potatoes. The losses from Late Blight and the rot it causes among stored potatoes amount to several million dollars per annum. On the question of disease control, valuable information has already been published by the Dominion Experimental Farms, but farmers are urged to refer their problems more freely to experts at the Farm, from whom they will receive the best attention.

Disease control is of far greater important in agriculture and gardening than is realized by the general public. Diesases, once they have attacked economic crops, can rarely be eradicated. A plant that once has fallen victim to disease, will never give a normal yield. Poor yields are n nine cases out of ten due to lurkng disease, hence individual effort becomes a necessity in saving the nation the deplorable devastation due to plant diseases.

A MESSAGE TO THE FARMERS OF CANADA

Dr. G. C. Creelman, Commissioner of Agriculture for the province of Ontario and Principal of the Ontario Agricultural College, Quelph, addressing the Agricultural Club of Ottawa at the University Club Rooms here, repeated a message to the farmers of Canada from Right Hon. R. E. Prothera, Secretary of State for Great Britain:

"I asked him for a message to the farmers of Canada" said Dr. Creelman, "and he told me that they wanted our chilled beef and that Canada should develop the chilled beef trade right away in preference to the live cattle trade. He urged that there should be no delay. He also said that after the war Great Britain would not devote so much effort to raising hogs, because they could be fed cheaper on this side of the Atlantic and as long as she can get pork products from this continent she would be satisfied to do so."

Dr. Creelman, remarking on the present hold-up in the bacon purchases said that while he had no direct information he regarded it as merely a temporary congestion.

PEACE—BUT NOT PLENTY

The end of the war has come, but Canada must not relax her efforts to increase the production of food. In addition to the Allies, whose productive powers have been hampered by the war and who needs imports from this continent to build up a reserve, the people of the neutral nations must also be considered. Canada Food Board calls attention to the fact, also, that the countries of the defeated enemy nations have also to be considered as in some cases millions of helpless people are facing starvation. Counting Russia, Austria-Hungary, Turkey, Bulgaria, the neutral countries, and France, Belgium, Italy and Great Britain, a grand total of 250,000,000 people are short of food.

Canada will have a hungry market for her agricultural produce and our greatest possible effort to maintain and increase production will be none too great.

* * *

It is certain that there is going to be a splendid demand for dairy products of all kinds. Effort is already being made to secure a greater amount of butter for Europe. The present prices of butter are more nearly in keeping with the advanced prices of other farm products than they have been since the war started and we believe this will be a factor in stimulating larger production in what is commonly termed the home dairies. Without doubt, the creamery patron will feed his cows and care for them better, thus increasing their production. It is not a difficult matter through liberal feeding and good care to increase the production of our herds at least 20%. Even if this is done, there will be no surplus of dairy products. We are advised that milk consumption in October was larger in some cities than at any other time in our history. It is our opinion that people are beginning to appreciate the importance and food value of dairy products. This, together with the world shortage, is going to make a splendid market for years to come.

* * *

"Farmers have not in the past been getting reasonable returns for the time and money invested in dairying. It will require considerabel education to cause the consumer to realize the value of dairy products. More and more, however, an impression is being made on consumers, and they are being brought to a realization that they must pay for quality in dairy products.—Hon. Geo. S. Henry, Minister of Agriculture for Ontario at the recent Winter Fair, Guelph.

* * *

In dairying, large production and profit go hand in hand. Breeding furnishes the most economical way to obtain large-producing cows. The pure-bred bull, with generations of high-producing ancestors back of him, must be used for breeding, and only the best heifers from the best cows should be chosen to be the dams of the next generation.

* * *

Aims of a higher order may not be entirely fulfilled and yet at that may often prove more valuable than those of a lower order entirely fulfilled.

PREPARATION FOR SPRING SEEDING OPERATIONS

The farmer known to be beforehand with his work will have made a calculation of the quantities of fodder, roots and grain required to carry his stock through till spring, the quantity which he will have to buy, and will have satisfied himself whether or not his home-grown is suitable and of sufficient quantity for his own seeding requirements.

An inventory of this sort should be made by every farmer not later than the month of February and preparations made for selecting, screeing and fitting for seed all grain of good quality.

A business-like appreciation for seed of the best quality is noticeable among those who buy, many of whom are ready to pay the top price for the best obtainable. A large amount of buying in seed grain will be necessary in the Province this spring, particularly in certain parishes where grain crops were damaged by bad weather, and it will repay the farmer who has a surplus of plump bright grain to prepare it and offer it for sale as seed rather than to feed it on the farm or sell it as feeding grain.

There is a general scarcity of seed oats in the Prairie Provinces and a large demand for seed in southern Alberta and Saskatchewan and South western Manitoba. It is estimated that the Canadian Government Seed Purchasing Commission has to provide approximately 3,000,000 bushels of seed oats. Shipments from Eastern Canada and the United States have already started westward to fill orders from the western Provinces. No general Municipal or Government action for the purchase of farm seeds is anticipated in the Province as there is evidence of sufficient supplies of seed now in the farmer's hands.

The difficulty of the buyer and the seller coming together is likely to prove the greatest hindrance to the sale of seed and because of the difficulty of securing seed in some parishes a diminished area may be placed under crop this season compared with last year.

There is now evidence that the labor scarcity wil be less acute this summer than has been the case since pre-war days, though the demand for food products will be quite as insistent. Consequently every acre should be made to yield its maximum crop insofar as the labor supply and the use of the best obtainable seed can contribute.

In an effort to assist the movement and trade in farm seed within the Province this Division of the Department of Agriculture, agrees to act as an exchanbe depot where correspondence of buyers and sellers will be received and the buyers be directed to persons who have seed for sale which will meet with their demands.

A sample market for the sale or exchange of farm seed is offered to the public in a Provincial Seed Fair to be held during March at Fredericton. Exhibitors will be given the opportunity of listing at the time of making entry all seeds which they have for sale. The Agricultural Societies of the Provnice will be advised of the quantities listed with the Department in a further endeavor to assist the exchange.

All person who have a quantity of the common farm seeds for sale or buyers who wish to purchase or exchange, are invited to list their lots or requiremenats with this Division.

O. U. HICKS,
Dept. of Agriculture.

THE WASTE BY RUST IN FARM MACHINERY

A well known English mustard manufacturer used to say he made his millions from other pjeople's waste. By that he meant that more mustard was left to harden and to waste in the mustard pot than was actually used.

Ahere is a chance for a Canadian statistician to compute the waste in farm machinery. If we only take the ordinary measure of depreciation on machinery generally, it will be found that the result is astounding. Everybody knows that machinery depreciation is reckoned in industry from as high as 15 per cent. down to 3 per cent. annually. Most of us in Canada, too, know that in 1918 there were 50,000,000 acres under cultivation. Putting the value of machinery on our farms at only $2.00 an acre, certainly a low figure, we have a total value for farm machinery of $100,000,000. Depreciation at the lowest rate accepted by accountants would represent $3,000,000 to be written off this very year. At the higher, but none too cautious, rate of 10 per cent, the sum would be $10,000,000.

Not all of this depreciation is preventable. But the fully one-tenth under this head is an equally low estimate to make up for that drop in value which can be prevented by a simple pot of paint, a brush and a little good will. Who has not seen plows, harrows, mowers, reapers, binders and what not left out in the fields right through the winter, without even a tarpaulin? It is that preventable waste running on this calculation from $300,000 to $1,000,00 a year for the whole Dominion, that the Food Board now calls to the business attention of the farmer. Carlessness should not be allowed to take a mortgage on farm machines.

Probably no implement on the farm is more abused through inattention than the plow. It has been left in the open ever since our great grandfathers plowed with a wooden share. But our great grandfathers had not to meet today's business competition. The bright parts should be coated with grease to prevent rust.

Thousands of odds and ends of farm machinery stand in the fence corners where they were left in the rush of the harvest, and stay there all winter. The mere housing of these would lengthen their life from 5 to 10 years. The difference between proper and improper care in this respect represents a sum on the total investment in farm machinery to pay a high rate of interest on initial cost.

With the stress of war on all the industries, not merely in Canada and the United States, but throughout the world, new machines cannot be supplied at the same rate as for the last decade. The roller mills will be employed on other orders. Bridges, buildings, railways and a thousand other things for the restored lands of Europe; the restocking with new machinery of every factory now employed in making munitions or clothing for the troops, and for everything remotely conected with the war, will make demands on the price of iron and steel that is bound to be reflected in the price of farm machinery. The farmer will be wise who resurrects all his broken and neglected farm implements, and follows the example of the railways and big corporations who are rebuilding and reconstructing as many as possible of their locomtives and rolling stock.

The United States has gone to the length of issuing several bulletins for farmers on the care and repair of farm machinery. In the introduction to one of these it is said:

"Thoughtlessness in the handling, care and repair of farm machinery results annualy in the loss of many thousands of dollars, and of much time to the farmer."

If time is money, the Canadian farmer will be wise to invest this winter in a little carefulness, a small stock of cheap greasy paint with a basis of white lead, and utilize the spare hours which will come when the snow falls in preparing for the next harvest by putting his machinery in such order that it shall go out spick and span, with nuts and bolts in their places, bearings running easily, cranks going without looseness, and no broken cogs. Above al things— now that the lesson of conservation has been taught by the sharpest lesson that the white races have ever had—the demon of rust should be kept away from every machine, implement and tool on every farm as fiercely as it is kept away in a awell regulated industrial workshop.

DISINFECT THE STABLES

The fact that regular disinfection of the stables is not a common practice in Canada is sufficient evidence that we as farmers are not thorough or do we appreciate the importance of the health of our animals. As in other countries, disease of animals is responsible for the loss to farmers of many millions of dollars annually. Such diseases as tnberculosis, abortion, scours, blackleg, glanders, hog cholera, etc., take enormous toll from our revenues. Again parasites such as lice, ticks, etc., each year cause the waste of enormous amounts of expensive feed to say nothing of the losses in production of milk, meat, and young stock. Farmers of Canada it is your duty and your best business to stop these losses. Don't wait till animals die of disease or are emaciated and hairless from parasites before discovering trouble. Diseases are spread more rapidly when animals are confined in winter quarters.

One of the most important factors in cheap and healthy wintering of animals is clean quarters and no quarters can be kept clean and free from disease and parasites without disinfection at least twice annually.

The basis of disinfection is direct contact. Disease germs under a layer of manure, straw or dirt, cannot be killed by average disinfection. Hence the first step is the thorough cleaning out of barns, scraping (and washing, if possible,) all walls and floors, and sweeping dirt, dust and cobwebs from walls and ceilings. Wood floors should be repaired and earth floors renewed with a layer of clean soil.

What Disinfection to Use

1. Sunlight. This is the cheapest and one of the best. Every stable should have at least 6 sq. ft. of glass per mature head of horses and cattle, and one-quarter of this amaunt for calves and mature hogs. Sunlight induces cleanliness, health, comfort and greater protfis.

2. Whitewash applied hot to ceilings and walls covers and kills germs and parasites. Add drug disinfectant, such as Carbolic Acid, if barns have housed diseased animals. Apply with spray pump or brush.

3. Drug Disinfectants: All floors, gutters and mangers should receive extra care. Disinfect by soaking thoroughly with one of the coal tar distillates such as Kreso, Wescol, Zenoleum, Creolin, etc., etc., applied in water solution 3% to 6% varying with strength of disinfectant. Apply with spray pump or sprinkle and brush in.

The Health of Animals Branch, Department of Agriculture, Ottawa, can supply free instructions in selecting and preparing whitewash and disinfectants.

Thoroughness in the above disinfection is most important. The intelligent stockman intent on maintaining healthy stock finds it wise to disinfect mangers and feed passages more frequently. A light spraying monthly will suffice.

Practise proves that disinfection is cheap insurance and an investment yielding a high rate of interest. If Canadian farmers unitedly will but realize this, our animal disease and losses therefrom would decrease 20% per annum.

DRIED BEET PULP AS A FEED FOR LIVE STOCK

An anaysis of dried beet pulp taken from Henry's "Feeds and Feeding" shows that it contains on the average 82% moisture, 3.5% ash, 8.9% crude protein, 18.9% fibre, 59.6% free extract, anl 9% fat. The fibre content being high digestibility is comparatively low, there bing found only 4.6% protein, 65.2% carbohydrates and7.8% fat, a total of 71.6% digestible nutrients. Dried beet pulp will absorb from 4 to 5 times its own weight of water and swells up proportionately, therefore it should not be fed, unless in very small quantities, without first being soaked. In this condition it has succulence, digestible nutrient conten and laxative effect, somewhat similar to corn silage.

As a succulent food. It has been found that 9 lbs. of dried beet pulp and 5 lbs. of mixed hay was 11% better for milk production than 45 lbs. of corn ensilage. With hay at $18.00 per ton and silage at $4.00 per ton this would give dried beet pulp a valuation of $10.00 per ton to replace succulent roughage.

As a supply of protein. Taking the analysis given above it is calculated that to supply protein in a ration for milk cows when bran is worth $32.00 per ton, then oats are worth $24.80 corn $20.00 and dried beet pulp $17.80 per ton.

As a supply of digestible nutrients. On this basis if corn is worth $50.00 per ton, then wheat bran is worth $36.54, oats $42.24 and dried beet pulp $42.96 per ton. In this case the valuation placed on dried pulp agrees with that of the Scandinavian feed unit system which rates it 10% below corn or barley. It also agrees with the findings of the Massachussetts Experiment Station where they found that it was equal to corn in a ration containing no succulence.

As a feed for fattening Stock. When used for this purpose with beef cattle and sheep it has been found to produce growth rather than to lay on fat, therefore it can be used to advantage in the early part of the fattening period but should be replaced by corn or other heavy grain during the finishing period. There appears to be no advantage in feeding it to horses while for swine it is much toi bulk. and fibrous unles for maintaing brood sowsy

Reviewing the subject it may be said: (a) dried beet pulp is low in protein and high in fibre, hence the protein is digestible in a relatively small degree, therefore it cannot replace any rich protein feeds like oilcake, cottonseed meal or even bran or oat chop in the supplying of protein in the ration; (b' it is useful when used to supplement a shortage of succulent roughages such as silage, roots and grass or to lighten up a heavy protein ration; (c) under certain circumstances (as a source of digestible nutrients); (d) it may acquire a value of $42.96 per ton while in other cases where succulence and cheap home grown carbohydrates (as in corn ensilage- are already present its value may b eas low as $10.00 per ton; (e) in the feeding of beef cattle and sheep it is better adapted to producing growth than to laying on of fat, but even for the former purpose is but as valuable as oats.

DISINFECT!

Great care and thoroughness should be exercised in cleaning and disinfecting barns and stable yards in which animals with contagious disease have been kept. Such diseases as glanders, anthrax, rabies, and to a lesser degree ,tuberculosis, are highly dangerous to man as well as to other animals and no laxity should be tolerated in cleaning up premises where these and other communicable diseases have been known to exist. The expense of a thorough disinfection is not large and the equipment needed is simple.

The following is a list of the most efficacious disinfectants: Chloride of lime; ;bichloride of mercury; formalin; carbolic acid; crude carbolic acid; compound solution of cresol. A pail and the ordinary spraying pump is usually satisfactory for applying solutions of any of the above.—W. H. Feldman.

HORTICULTURE.

INCREASED EXPRESS RATES

Ottawa, December 31, 1918.

Editor The Maritime Farmer:

The Express Companies in Canada have recently made application to the Board of Railway Commissioners for permission to increase their rates.

The proposed increase is of general application, but as it is the intention to cancel all commodity tariffs, the fruit industry in both Eastern and Western Canada will be one of the interests most seriously affected.

Your attention is directed to the following schedule of present and proposed rates, in cents per 100 pounds:

From	To Halifax		To Moncton		To Truro		To Sydney	
	Present	Proposed	Pre.	Pro.	Pre.	Pro.	Pre.	Pro.
Kingsport	60	75	100	120	60	75	120	150
Canning	60	75	100	120	60	75	120	150
Falmouth	40	75	80	105	50	75	120	135
Hantsport	50	75	80	105	50	75	120	135
Wolfville	50	75	80	105	60	75	120	135
Port Williams	50	75	100	105	60	75	120	135
Kentville	50	75	100	120	60	75	120	150
Cambridge	60	75	100	120	60	75	120	150
Waterville	60	75	100	120	60	75	120	150
Berwick	60	75	100	120	60	75	120	150
Aylesford	60	75	80	120	60	75	120	150
Auburn	60	75	80	120	70	75	120	150
Kingston	60	75	80	120	70	75	120	150

The present rate to St. John, N. B. is 70c., proposed rate 90c.; to Campbellton the proposed rate is $1.65.

The object of this letter is to obtain an expression of opinion from those directly interested. In the meantime the Board of Railway Commissioners have been advised that in all probability representatives of the fruit industry will desire to be heard when the case comes up. You are therefore, requested to give the matter your careful consideration and if you think objections should be made before the Board I would be glad if you would state as fully as possible your reasons, along with any specific data you may be able to supply.

Hoping to hear from you with as little delay as possible, I am

Yours truly,

G. E. McIltosh,

In Charge Transportation.

THE FIGHT AGAINST THE BROWN TAIL MOTH

Among the many activities carried on by the N. S. Dept. of Agriculture, not the least in importance is the campaign, now in its tenth year, against the Brown Tail Moth. This work is under the jurisdiction of the Entomological Branch, and being of a more or less quiet police character, is probably little known outside of certain areas.

The Brown Tail Moth is one of the most destructive of all insects. Where it gains headway and becomes established it will devastate whole areas of fruit and other trees in a single season. The U. S. Government, after allowing it to get a foothold in New England, has recently spent many millions of dollars in the endeavor to control and extripate this pest.

It is worth remembering that all these life forms, when native or long established, are checked to a greater or less degree by natural foes or parasites which prey upon them. When carried into strange territory, however, they are apt to be immune from these foes for many years, and thus may multiply to an alarming degree before meeting any natural check. This is the history of the Brown Tail which was imported from Europe, and failed to bring its parasites with it. The introduction of these natural foes is one method of combating it, now being carried on by the Dominion Department. But a far more effective and immediate remedy is necessary to prevent its ravages.

The Entomological Branch of the local Department, in cooperation with the Federal Department, the expense being halved, has at the present moment some ten men, divided into small parties, scouting the infested areas, and destroying the winter nests. The area of infection thus far corresponds roughly with the main fruit belt in Nova Scotia, though the pest has never been allowed to gain enough headway anywhere in the Province to make it appear to many people as a serious menace. The work being done falls into two divisions, the widely ranging scout work on the outskirts of this region for the purpose of preventing its spread, and the more intensive work of carefully examining the region where it is known to be, so as to destroy every nest possible. The following table, giving the number of nests found and destroyed, indicates at once the menace to fruit growers from this source, and the success attending the efforts to overcome it.

In the year	1909....	1496 winter nests
"	1910....	4462 "
"	1911....	8070 "
"	1912....	11055 "
"	1913....	24156 "
"	1914....	18254 "
"	1915....	14845 "
"	1916....	10019 "
"	1917-18..	3024 "

The period reported on so far for 1918-19 gives a return of 413 as compared with 1400 for the corresponding period of last year. Thus the persistent effort of the Department is now showing a very gratifying result. When the possibilities of fruit growing in Nova Scotia are taken into account, the value of this piece of work becomes inestimable.

GLEANINGS FROM THE N. S. DEPARTMENT OF AGRICULTURE

Field Crops Competition

It is gratifying to observe that interest in the Field Crops Competition conducted by the Local and Federal Departments of Agriculture, is on the increase. The entries in 1918 totalled 583, a gain of 150 over 1917. The scores were very high, especially in grain and turnips. The prizes won reach the respectable total of $2022.50.

A noteworthy fact appears when the report of these competitions is laid beside the report of the Maritime Seed Fair held at Summerside, P.E.I., that every Nova Scotia prize winner at the Seed Fair had appeared in the Field Crops Competition.

This fact bears several inferences, but a most obvious and important one is the close relation indicated between a first class field crop and good seed. There was a sufficient number of prizes won at the Seed Fair to prove that this Province is capable of producing the very finest quality of seed. It is not necessary here to argue at length the advantages of using such seed. The evidence on every hand pointts so conclusively to its supreme value that the Department is strongly urging the use of registered seed, and will announce in its field crop circular for this year, that in 1920 prizes will be awarded only to those who use this quality.

It will be well to get ready this year. A concession recently made by the Canadian Seed Growers' Association, whereby the immediate progeny of registered seed may in turn be registered, provided that it is up to the standard and has been properly inpected, makes this requirement much less exacting. Buy registered seed for your 1919 sowing and be prepared.

The Registration of Seed

While the process of obtaining registered seed is fairly well known, in view of the increasing interest in the matter, an outline of the steps necessary may be apropos.

The registration of seed is peculiarly the function of the Canadian Seed Growers' Association, with headquarters at 114 Vitcoria St., Ottawa, of which, up to the present time, the farmer must be a member in order to secure registration. This organization co-operates with the officials of the Federal and Provincial Departments of Agriculture in every possible way.

To prepare seed for registration the heads are hand picked for three successivie years; that is, the seed threshed from the first year's handpicking is sown the next year in a

Plan NOW to Spray for Better Results

YOU will plow, harrow, cultivate and assist your land in every possible way the coming season. Then, why not go a step further, and, when you have raised a promising crop, start in early on the pests and blights that will try to undo all your good work of plowing, harrowing and cultivating.

Spraying needs no argument. Your best friends and the most progressive, prosperous farmers throughout the world will tell you that the world's foremost spraying apparatus bears this name:

Spramotor

it isn't a SPRAMOTOR unless we made it

IMPORTANT

Raw materials are becoming more difficult to get week by week. We advise ordering at once to be sure of spring delivery.

While not the lowest in price, the Spramotor is absolutely the cheapest reliable spraying machine you can buy. We make them for all purposes and ship all over the world. Hand machines, barrel outfits, knapsack sprayers, horse-operated and power machines. at prices ranging from $7 to $400. Adapted for all kinds of spray work in field and orchard, as well as for painting, whitewashing, spraying disinfectant, etc. Made in Canada —No duty added.

FREE A complete, valuable treatise on all kinds of spraying will be sent you postpaid on request. Write for your copy today.

THE LONDON SPRAMOTOR, 6032 King St., London, Canada

For Better Garden Results Sow Dupuy & Ferguson's Seeds

Choose Early!

No matter how you view it, you cannot do better than make an early choice of your seeds. You can still pick your favorite brands and be sure of getting them in proper quantity. There will be no let-up in the demand for vegetable produce.

DUPUY & FERGUSON'S 1919 CATALOG

will help you to make a careful, well-chosen selection of the very highest grade of seeds. Last year's motto: —"Sow all you can, grow all you can" —is stronger than ever. Write for your catalogue and get your order in as early as possible.

BURN YOUR RAILS
Buy
Sarnia Woven Wire Fence
Stop that waste. Rails are worth more for firewood than woven wire fencing costs. Then, too, the ground you gain when you can plow to the straight fence line will yield grain or other crops enough to soon pay for the fence. Looks better— is better. It means clean Farming, more crops and larger profits. Be a 100% Canadian farmer.
SARNIA
Fencing is the kind that is made right. Stands trim and tight, adjusts itself to all weather conditions, requires fewest posts. Made and shipped from our factory in Canada for Canadian farmers. Only two profits—a big one for you and a small one for us. Given genuine fence satisfaction. Shipped fresh from our loom. You get a new fence when you buy the Sarnia, not one that is second handed because of several times handling or having stood around in dealer's store or out in the open weather. Thousands of satisfied farmer customers. No middle profits. Our "Fence Facts" circular and price list is free to you.
WRITE FOR IT,
SARNIA FENCE COMPANY, Ltd.

Sarnia, Ontario.

definite plot, and, in turn, hand-picked for the next year's seed. The crop must be inspected each year by a qualified seed inspector. The third year a sample is also sent to Ottawa for examination and registry there with the Seed Growers' Association. The party carrying out this work is then eligible for membership in the Association, and, when inspected and sealed in bags by the seed inspector, the seed is ready for the market as registered seed.

The philosophy underlying the whole process is exactly that which has given us improved breeds of stock, and such wonderful results in the fruit line as have been attained by the famous Burbank and others. The selection for a period of years eliminates the weaker kernels, greatly lessens the risk of disease, dismisses weed seeds altogether, and reserves the function of production to seed that is clean, virile and of the most productive parentage. The experience of the Association is that registered seed may be expected to yield from three to five bushels per acre more than unselected seed, and of a superior quality.

Further information on the whole question may be obtained at any time from either Mr. S. J. Moore, Dominion Seed Inspector for the Province, or Mr. F L. Fuller, of the Local Department. The address of both these gentlemen is Truro, N. S.

Prize Winners at the Maritime Seed Fair

Nova Scotians will be glad to know that their Province held her own very creditably in the interprovincial Seed Fair recently held at Summerside, P.E.I. There was one Nova Scotian winner in Class 1, which was open only to members of the Canadian Seed Growers' Association, Mr. W. L. McFarlane of Fox Harbor, who won a third prize for Banner Oats, and a second for Six Rowed Barley.

In Class VI., open to all the Maritime Provinces, there were very large entries, particularly in the Banner Oats section. This is the largest item of all, and the first prize went to a Nova Scotia, Mr. Alex. C. Chisholm, of North Grant. Mr. John R. Harrison of Maccan, won a fourth in this section. Mr. Harrison made a record, winning a first in wheat, (any variety) a second in White RuRssian wheat, a first in field peas ,a second in Timothy Seed- and a fourth in colored beans. Other winners were Albert C. Veniotte of West Northfield, who won a first in carrot seed and a second in field peas, and James J. Dunn, Lower South River, who won a fourth in turnip seed. It is significant that all these winners had appeared in the Provincial Feld Crops Competition.

Agricultural Competitions

The report of the Field Crops Competitions in N. S. for 1918 indicates that the Counties are having the largest entries were Inverness, Antigonish and Richmond. Those who are familiar with agricultural activities at once observe that the interest taken in these competitions and in other lines of scientfic and exhibitory character is a key to the general progressiveness of the district agriculturally. The invidiousness of comparison is eliminated when we add that several other countries closely followed those named.

At the interprovincial Seed Fair there was one class of entries confined to competitors in the Nova Scotia Field Crop Competition including seed wheat, oats and potatoes. The largest winner in this class was Mr. Alex C. Chisholm, of North Grant, who took prizes in all three. Other prize winners were Messrs A. B. Cunningham, Tatamagouche; W. L.McFarlane, Fox Harbor; John R. Harrison, Maccan; Joseph E. Coady, Margaree Forks; J. L. Cunningham, Bayhead; Samuel Freeman, Amherst and John McMullen, Georges River, all in the wheat section. In the oats section, Messrs. T. J. Grant, Antigonish; William Olie, Selma, and J. L. Cunningham were winners. in potatoes, Messrs. Chisholm and McMullen.

There can be no doubt that these various competitions, fostered as they are by both Federal and Provincial Depts. of Agriculture, have been very effective in stimulating the production and distributing of improved and clean seed.

POTATO HARVEST OF 1918

The returns already published showed that the total area planted to field potatoes in Canada this year was 735,192 acres, as compared with 656,958 acres in 1917, both years establishing records. The estimated yield per acre for Canada this year is 143½ bushels, as compared with 121½ bushels last year, and with 150¼ bushels, the average for the ten years 1908-17. The total estimated yield of potatoes for 1118 is 105,579,700 bushels, as compared with 79,892,000 bushels last year. The yield for 1918 is the highest on record, the previous record being over 99 mililons in 1909. By provinces, the highest average yield per acre is in British Columbia, 228 bushels, the other provinces ranging in order as follows: Nova Scotia 194, Manitoba 185, Prince Edward Island 170, New Brunswick 158, Quebec 147, Ontario 123, Saskatchewan 116¼ and Alberta 70½ bushels per acre. The largest acreage and production of potatoes this year is in Quebec, the total yield being 38,936,000 bushels from 264,871 acres, Ontario being next with 20,443,000 bushels from 166,203 acres. The average per bushel of the potato crop is 98 cents as compared with $1 last year, and the total value is $103,636,100, as against $80,804,400 last year.

FALL WHEAT AND FALL PLOUGHING

The area estimated to be sown to fall wheat for 1919 is 5 p. c. less than that sown last year the area being 840,000 acres, as against 886,000 acres, the revised estimate for 1918, based upon the returns collected in uJne last. As compared with the original estimate for 1918 viz., 711,000 acres, the area for 1919 is 129,000 acres, or 18 p. c. more. On October 31 the condition of the fall wheat crop was for Canada 102 p. c. of the decennial average. nI Ontario, also, the condition is 102, but in Alberta it is 98.

About 56 p. c. of the land intended for next year's crops has been ploughed this fall, this proportion being similar to that of each of the past three years. In the Prairie Provinces the percentages are for Manitoba 54 as against 40 last year, in Soskatchewan 39 against 37 and in Manitoba 35 against 38.

Eureka Potato Planter
Pays for Itself in Labor and Time Saved
One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.
Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. Furrow opens and seed drops in plain sight—an equal distance apart, at uniform depth, with absolutely no injury to seed. Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.
Write for free catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. In Stock Near You. A success for over 20 years. Whether you are a large or small grower—write today.

DAIRYING.

THE SIRE AN INVESMENT PURELY

When a man purchases his herd sire, he should bear one point in mind continually—he should consider his prchase as an investment.

There is probably no other place where the same amount of money could be put to work more profitably. It matters not whether he is a well established breeder or whether he is just keeping dairy cows for the monthly milk cheque, the sire is his very best investment. In this same connection there is another point to be borne in mind—the fact that often times the bull that costs a four figure is cheaper than the one that can be bought for less than $100.

When a man buys a farm, he takes a great many things into consideration, for he expects to gather a harvest of profit from that farm every year for a long time to come. When a man buys a bull he should likewise take a great many things into consideration, for the right sire is going to bring him a handsome profit every year as long as he stays in the herd. This will be through the improvement in the crop of calves that are born each year. As the sire impresses his individuality on his offspring he will inevitably pay back to his owner a dividend that will aggregate several times his purchase price.

That is the reason why the money spent for the sire that heads the herd is invariably an investment rather than an expense. It is an investment whose returns are cumulative in the superlative degree and it is an investment that the breeder must make wisely and freely, even though his would-be advisors hold up their hands in horror because of his unprecedented plunging. If he uses judgment in this, the plunging will be of the wisest kind.

The Individual Cow

One writer on dairying says, "The time is here when the basis for profitable dairying must be the individual cow."

There is many a dairyman who has been making a profit on his entire herd and feeling satisfied therewith. Naturally this refers to the man whose profit comes exclusively from the milk rather than the man who is depending upon both the dairy product and the offspring, or, in other words, the breeder of registered stock.

The mere fact that these farmers who are keeping the dairy herds are able to make a profit on their entire herds is a high reputation for the sort of cows they are milking, for inevitably in a bunch of 25 or 30 cows that are selected indiscriminately there will be some that do not pay a handsome profit. This is not to the discredit of the herd or the breed; it is merely the immutable law of nature. The man who would go farthest in his dairy work is the man who seeks out these unprofitable cows and makes up his herd from those that show a real profit.

As is stated above, it is now a question of the individual cow and not of the entire herd. Naturally the ideal system is to do official test work, but, if this is impossible then go into the cow testing association work. If there is no cow test association available, go after the work personally. Under any circumstances, maqe your herd a group of individuals, every one of which is paying a handsome profit, rather than a bunch of dairy cows which are simply returning a good sized milk cheque every week.

There may be certain marks which indicate a good milker, but there is no sure guide except to weigh the milk and food. The farmer will then know extctly the kind of cow and how much her milk costs.

AYRSHIRE SILVER CUP WINNERS IN THE R. O. P. 1918

The following are the three highest scoring cows in their respective classes in the R. O. P. for 1918. The first mentioned cow in each class being the Silver Cup Winner.

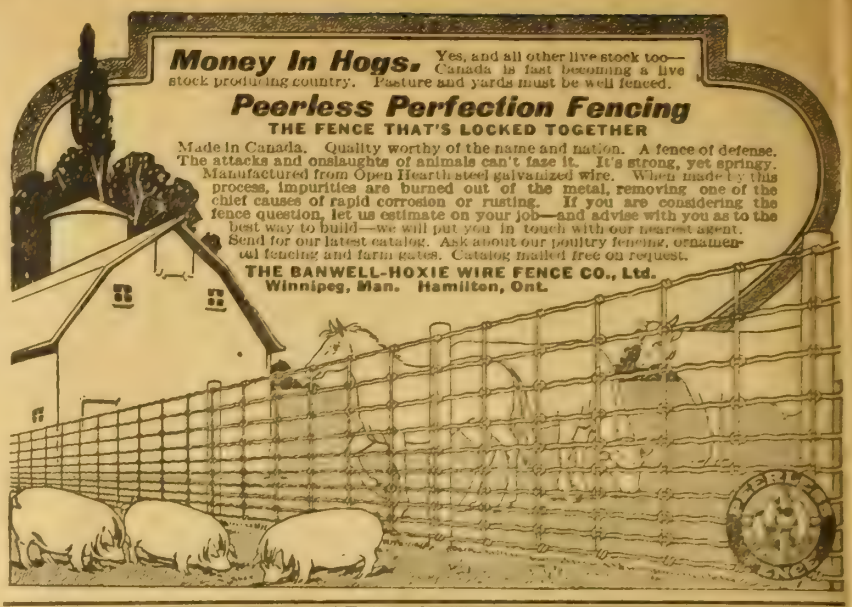
CARE AND FEEDING OF DUCHESS SKYLARK ORMSBY

(By Axel Hansen.)

The feeding of Duchess Skylark Ormsby, the greatest record coy ever known, began three months before her last calving. By this, I mean to say that she was dried off and gotten into condition. She was by no means fat when she freshened; however, she was in the pink of condition, which I favor more than being overly fat. She was fed a ration at this time that had the following favorable characteristics. It was bulky, light, cooling and laxative, consisting chiefly of bran, ground oats, brewers' grains and linseed meal. Corn silage, alfalfa hay and roots constituted her roughage. She was fed all the grain she would eat up clean. This was continued until ten days before she freshened; then he ration consisted of bran, two parts; oats, two parts. oil meal, one part; and the quantity was cut down to 10 to 12 pounds a day and later to six to eight pounds so as to cool out her system befor calving.

On Nov. 14 she dropped a male calf. She was immediately given a pailful of lukewarm water, and about an hour later was fed a warm bran mash, and a woolen blanket was put on her to protect her from drafts. The calf was left with her for two days so as to get the colostrum milk, which is very beneficial to new born calves. During the next two days her ration consisted of bran, oats and oil meal, same proportion as prior to calving, and she was fed 10 to 12 pounds in four feeds and 20 pounds silage, 25 pounds roots, 10 pounds alfalfa hay. She was given luke warm water to drink for several days. On the third day the calf was removed and a little hominy and gluten was added to her grain ration and about five pounds silage added to her roughage, amking a total of 25 pounds. A daily increase of her grain ration at



Money In Hogs. Yes, and all other live stock too—Canada is fast becoming a live stock producing country. Pasture and yards must be well fenced.
Peerless Perfection Fencing
THE FENCE THAT'S LOCKED TOGETHER
Made in Canada. Quality worthy of the name and nation. A fence of defense. The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting. If you are considering the fence question, let us estimate on your job—and advise with you as to the best way to build—we will put you in touch with our nearest agent. Send for our latest catalog. a rate of two pounds per day, soon indicated that Duchess was not going to consume 35 to 40 pounds grain per day, for she objected to 25 pounds per day, so we backed up to 22 pounds, and this seemed to be her limit.

She was taking 25 pounds silage, 30 pounds roots and 15 pounds alfalfa hay in the way of roughage. At the end of her first month she was consuming 22 pounds of grain, consisting of bran, oats, hominy, brewers' grain, glutten, at a ratio of 1-4-5. This seemed to be her favorite mirture with slight changes from time to time, according to her likes and dislikes.

Soiling Crops

As soon as the fields would allow it in the spring, soiling crops were put in to be fed during the hot summer months, and to take the place of silage and roots in the winter. Three plots of oats and Canadian field peas were sown at from 10 to 12 day intervals so that the second seeding would be ready to be fed when the first was gone and the third seeding to follow the second in the same manner.

When spring and warmer weather approached, her ration was changed to a more bulky and cooling ration, and the oats and peas were cut and fed as soon as 10 inches high. During the months of June, July and August she consumed from 16 to 20 pounds of grain, about 150 pounds of soiling crops and 15 pounds of alfalfa hay per day. After the oats and peas were all fed, or too ripe to be of any value as green feed, sweet corn and laer ordainary field corn were used for succulence and he bulk in her ration. After the potato crop was harvester, a second crop of corn was planted, which transferred an abundance of splendid green feed until the frost came in the fall, then rots and silage were used to replace the green feed and to fill the need of succulent and palatable roughage, and her ration was changed back to feeds of a more heating nature than she was getting before the hot weather.

Duchess was kept in the barn during the entire year. She was taken out for half an hour's exercise when the weather would permit it during the winter and was taken out every day during the summer, usually in the evening between 6 and 8 o'clock. Her stall (box stall) was kept dark and cool by means of electric fans, and a fly net was kept on her to prevent flies from annoying her. She was groomed at least once a day during the entire year and milked four times a day.

Now the great question is. "Will this great record ever be beaten?" I wil lanswer this question in the affirmative, and why not? Are the breeders of dairy cattle not entitled to better and bigger results after spending thousands of dollars and years of hard work trying to develop their herds to a higher degree of efficiency?

I feel certain that there will be several 1,200 pound fat cows in a few years.

MANUFACTURE OF CREAMERY BUTTER

The process of butter making at the present time seems to be undergoing a series of evolutions, and many of us are beginning to wonder just where we are at and if we have got to go back to school and learn the science of butter making all over again. There have been some rather startling announcements made of late in regard to new methods advocated for the improvement of creamery butter, and whilst I am in favor of taking advantage of every aid which science may evolve for the improvement of the finished article, at the same time we must not overlook the fact that the quality of the raw material has a preponderating effect on the quality of the finished article over and above any mere deviation in method of manufacture.

The one big weakness which affects dairymen in general is this tendency of applying local or surface remedies for evils deep seated and of constitutional character. Form time immemorial we have been taught that in order to have a fine quality of butter we must first produce a fine quality of milk and cream, feed the cows on good wholesome foods and use every precaution to guard against the flavor being injured from any cause whatever. The development of lactic acid in the cream by the butter maker was considered of paramount importance in order to produce that distinctive butter aroma so characteristic of fine, weel made butter. The market today, apparently, demands a mild, almost tasteless butter, and we are getting away from that distinctive aroma always associated with good butter in the past. I have frequently wondered if we are always safe in being guided by the opinions of the trade. Do these people fairly reflect the desires of the consuming public or do they not rather reflect the opinions of the dealers as to the qualities which are less risky and show the smallest percentage of losses. There may be a vast difference between the qualities which the consumers may want and those which the dealers find profitable in handling. It should be our business as educators to co-ordinate these two requirements.

When the buttermaker separated the cream from the milk himself at the creamery he could by pasteurization and the use of a pure culture of lactic acid organisms produce a butter which not only had that desirable distinctive aroma but had good keeping quailities as well, which made it a safe commodity for the dealer to handle. As the whole milk creamery is practicall extinct and as the buttermaker is being furnished with a constantly changing quality of raw material, the whole process of butter making is graduallq changed to meet in the first place the demands of the dealers for a safe commodity to handle and which will be reasonably satisfactory to the public. Our effort to do this has resulted in the production of a butter of entirely different characteristics to those required a few years ago. We are now making a butter which may more easily be imitated by "Oleo" manufacturers and for that reason is to be regretted. It is the tendency of human nature to travel along the lines of least resistance and we as butter makers have found it more convenient to cover up the defects in our butter by changing our methods of manufacture rather than attack the real cause of these defects by demanding a better quality of cream and by being prepared when it is offered.

We are getting more and more in line with the manufacturers of shoddy cloth—trying to give our consuming public appearance for substance. We can no more produce a high quality of butter from inferior cream than we can sound cloth from shoddy material. In anything I am about to say regarding improved methods in manufacture I do not wish you to lose sight of the fact, that no process of manufacture can entirely overcome defects in the raw material and that improvements in method of manufacture sould go hand in hand with improvements in the quality of the raw material.

From the limited amount of work which we have been able to do at the Eastern Dairy School this fall we feel we are safe in issuing the following instructions which we ask our makers to follow with descretion.

Pasteurization is the one great aid to be used to give butter its keeping qualities. If the cream has a high acidity, first warm up to betweent 70 and 80 degress F. and then add sufficient neutralizer to reduce the acid to form .28 to .35 per cent. Then pasteurize to a temperature of 170 degrees F. for 5 to 10 minutes and cool to churning temperature. The longer the period between pasteruization and churning the better the results, especially in the texture and grain. At least three hours should elapse before churning. Wash the butter with pure water in which germ life has been rendered inactive at a temperature 2 to 5 degrees lower than churning.

In order to have control of the moisture content, pass the butter through the rollers a few times and

DE LAVAL

The World's Greatest Cream Saver

All over the world creamerymen, big milk concerns, dairy authorities and cow owners who have special opportunity for judging the worth of cream separators have for years recognized the superior skimming and all around efficiency of the De Laval.

That's why 98% of the plants throughout the world separating large quantities of milk use the De Laval. It skims so much closer that they can't afford to use any other machine.

That's why 2,325,000 De Lavals are in daily use, more than all other makes combined.

Not only is the De Laval the greatest cream saver but it turns easier, is easier to wash, has larger capacity and greater durability than any other separator.

The more you know about cream separators the more certain you are to buy a De Laval.

FEEDING CATTLE IN NOVA SCOTIA

By Prof. John M. Trueman, N. S. A. C.
Truro, N. S.

(Continued from last issue)

On account of the present difficulty in getting bran, middlings and cotton seed meal greater use is being made of these proprietary feeds than usual. They are made up of by-products of mills that are manufacturing such articles as cereal breakfast foods, glucose, corn oil, beet sugar, molasses, etc., and these by-products are mixed to some extent with such standard feeds as cotton seed meal, oil meal, corn meal, and oats. In addition to these mixed feeds there are also on the market various grades of wheat screenings. One grade is sold under the name of "Ground Special Screenings" and is made up almost entirely of weed seeds removed from wheat at the great elevators and flouring mills. These ground weed seeds have somewhere near the same composition as wheat bran, but are not so well liked by the cattle. When mixed with other palatable feeds however they are readily eaten and give good satisfaction. Another grade of screenings is sold by the Feed Branch of the Dominion Department of Agriculture, Ottawa, under the name of "Recleaned Unground Wheat Screenings." This material contains a large amount of small and broken kernels of wheat, and seeds of wild buckwheat. The wild buckwheat makes the meal from these screenings quite dark and for that reason farmers in some sections have been prejudiced against it. Where it has been tried out thoroughly however, the cattle eat it readily and it is giving good results. It has proven particularly valuable as a substitute for middlings for pigs. The pigs like it and thrive well when getting it. The following circular letter sent out by the Dominion Live Stock Branch explains fully its composition and value.

Elevator Screenings.

A short time ago the Department of Agriculture purchased a considerable quantity of recleaned screenings from the various terminal elevator companies at Fort William and Port Arthur. This material is now available for shipment. The price is $36.00 per ton in bulk, unground f. o. b. Fort William, (which would mean approximately $46.00 at Nova Scotia points.) We believe that it is excellent value at this price and that it will pay the feeders to consider the purchase of a carload or more for feeding purposes at different points throughout the Dominion.

The analysis of this feed is as follows:—

Chemical		Botanical	
Protein	14%	Broken Wheat	46.1%
Fat	5%	Oats	1.0%
Fibre	8%	Flax	.1%
		Wild Oats	10.65%
		Wild Buckwheat	35.15%
		Mustards	.7%
		Other Seeds	.65%
		Chaff	5.65%

While the botanical composition may vary to a slight extent the percentages of protein, fat and fibre will remain almost constant and, consequently, the feeding value will change but very little.

If arrangements can be made to have this mixture ground on arrival at destination, it would be well to do so as the vitality of any weed seeds contained, would be practically destroyed thereby, and at the same time the feeding value would, to some extent, be increased through the meal being more digestible than in the unground material.

Those desiring to purchase these screenings should forward their orders direct to the Feed Division, Live Stock Branch, Ottawa, accompanied by Bank reference. All sales will be for carloads only and on the basis of sight draft with Bills of Lading attached.

All orders will be filled strictly in order as they are received and in view of the possibilities of railroad congestion with the approach of winter, feeders will be well advised to order early.

Dominion Live Stock Branch,
Ottawa, November 11, 1918.

A fairly good way to determine the comparative value of these feeds is to take those which have approximately the same per centage of protein and fibre and compare their content of total nutrients. If they are fairly alike in all these points they should have somewhere near the same feeding value, and the price will therefore determine which is the most economical one to buy. Groups of feeds that may be compared in this way are given below.

We can only compare in this way feeds that do not have a great variation in protein content, because feeds high in protein have a special stimulating effect upon growth, fattening and milk production which over-balances their mere content of total nutrients. The feeds on the market may be divided into groups that may be compared with each other as follows: Group No. 1 would contain a moderate amount of protein, but would be rather high in fibre and may be known as the bran group. It would include such feeds as bran, dried beet pulp, Eureka Feed, "Echo" feed, "Sampson" feed, "Schumaker" dairy feed, "Banner" dairy feed, Ground Special Screenings, and Ground Standard feed.

Group No. 2, would contain generally more protein and less fibre and would be known as the middlings group. It includes standard wheat middlings or shorts, high grade flour, wheat middlings (which it is against the law to make in Canada at the present time), recleaned unground wheat screenings, "Monarch" hog feed, "Monarch" dairy feed, molasses dairy feed, low grade gluten feed and red dog or feeding flour.

Group No. 3 would include the high protein feeds and may be known as the linseed meal group. It includes buckwheat middlings, high grade gluten feed, linseed and cotton seed meal.

A few other feeds may be mentioned that would not fit exactly into any of the groups given above. One of these would be oat feed. This contains a large proportion of oat hulls and is low in protein and in digestibility. It should be bought at a low figure and be mxed with richer feeds, if used at all.

Another feed exactly opposite to oat feed in character is corn meal. It contains the lowest percentage of fibre and the highest percentage of total nutrients of any feed on the market. It is easily digested and extremely palatable. It is not included in any of the groups above because it is equally relished by cows, calves and pigs, is good for milk production, especially valuable for fattening all classes of live stock and at present so high in price that it deserves special mention. A number of cars of sample corn have been bought by dealers and farmers in this province within a few weeks and this is available fo feeders at a reasonable price.

Still another feed that should be mentioned is cotton seed feed. This is a mixture of cotton seed meal and cotton seed hulls. It varies in composition depending upon the proportion of hulls present. The cotton seed meal is it's only valuable constituent as the hulls are tough and leathery and poor feed. Although it may contain 24% of protein only about 58% of that will be digestible making the real amount available to the animal only about 14%. It will be known by it's high content of fibre which will likely be over 21%, whereas prime cotton seed meal has only 10%. This material when sweet and sound is a valuable feed, but should be bought at a much lower price than good cotton seed meal.

The high protein feeds are represented on our markets largely by linseed and cotton seed meal. At the present time cotton seed meal cannot be obtained in Canada as the United States has placed an embargo on it's exportation, although this embargo may be lifted at any time. Just now, however, linseed meal can be obtained in fairly liberal amounts, and for that reason the following brief discussion of the comparative value of the two meals is inserted here.

Linseed and cotton seed meal are practically of equal value as far as their content of total digestible nutrients is concerned. Linseed has less protein, but more carbohydrates. There is a difference in the feeding value of these meals, however, that is not measured by their chemical analysis. Linseed meal has a more laxative and cooling effect upon the system than cotton seed. When silage or roots are being fed it does not make much difference which of the meals is used, but when only hay is availabel the linseed is a much better addition to the meal ration than cotton seed. In such a case I would pay more for linseed than for cotton seed and even when roots were available I would buy linseed unless the cotton seed was much the cheaper.

Furthermore the linseed meal is a safe feed to give to all classes of farm stock, while on the other hand cotton seed meal should never be fed to calves or pigs except in very limited quantities and under the careful supervision of an expert feeder. It contains a principle that will cause sickness and even death in young calves and all pigs. Linseed meal may be fed to pigs, cows, calves, horses, colts and sheep. It may make up one fifth of the meal ration of pigs, calves and sheep to great advantage, and gives excellent results when fed in quantities of from one to two pounds daily to horses. With dairy cows the best results have been obtained when linseed constituted anywhere from one-fifth to one-half the total meal fed. The Nova Scotia Department of Agriculture has placed this year with dealers, and farmers co-opeartive societies some 2000 tons of linseed meal and will continue this policy as long as the present difficult feed situation exists. The Feed Division of the Dominion

A Word to the Wise

The condition of your stock in the Spring depends on one thing and one thing only—the amount of nourishment they can extract from the food you feed them during the Winter months.

Stock barned up and deprived of their natural requirements—green feed and exercise—often go off their feed altogether, and lose condition rapidly, if the proper tonic is not given them regularly to keen the appetite, stimulate the digestive organs and help them assimilate the food they eat.

Remember! No matter how expensive feed you give your stock they will not thrive nor give the productive results they should during the Winter months without a digestion promoting tonic. It is not the amount of food an animal consumes that builds up the system, but only the amount of food the digestive organs assimilate and convert into blood, bone and flesh.

Follow the example of thousands of stock breeders and farmers—feed

INTERNATIONAL Stock Food Tonic

It costs little—3 feeds for 1 cent. It does much—keeps your stock sleek, healthy and robust.

For Horses-- You know the likelihood of horses becoming out of condition, unthrifty, sluggish in appearance, rough, hide-bound, dry and dead coats, stocked in limbs, etc. INTERNATIONAL STOCK FOOD TONIC will quickly enable the animal's system to throw off these ailments. Your horses need a preparation just like this during the winter—something to help them keep the digestive organs working properly, purify the blood, etc., and remember the cost to use is remarkably small—LESS THAN THREE FEEDS FOR ONE CENT.

For Hogs-- INTERNATIONAL STOCK FOOD TONIC is composed in concentrated form of herbs, roots, and minerals, etc., which substitute to a large extent the ingredients hogs obtain when rooting about on free range. Its use saves waste that occurs in winter through imperfect digestion and diverts the feed to its proper body parts and organs. It gives hogs a keen appetite and strengthens the flow of digestive juices. It keeps the system toned up and in a clean, healthy condition and free from worms. Its use will save you thirty days in proparing hogs for market.

For Cows-- INTERNATIONAL STOCK FOOD TONIC is rated one of the best preparations ever made for every day feeding to dairy cows and fattening cattle. It is composed of the best known ingredients that assist the body organs to perform perfect assimilation, which is the secret of milk making and fattening. By feeding as directed it will increase the quantity of milk and keep your cows in a toned up, healthy condition, and give them an extra relish for their feed.

READ THESE TESTIMONIALS.

Centreville, N. S.

Dear Sirs :

I have used lots of INTERNATIONAL STOCK FOOD TONIC. I have used about one hundred pounds last summer. It is the best tonic I have ever fed to young pigs. It makes them grow fast and keeps them in good condition; also it is good for horses.

(Signed) Thos. N. Ketch.

Eastern Harbor, N. S.

Dear Sir :

I have fed INTERNATIONAL STOCK FOOD TONIC with good results. It kept my horses healthy, with a fine sleek coat, and I have had no trouble since using it.

(Signed) Geo. L. Brun.

Fredericton Jct., N. B

Dear Sirs :

I think INTERNATIONAL STOCK FOOD TONIC is a great thing for stock. We wouldn't be without it for anything. We feed it to our horses and it keeps them in fine condition; in fact, every person admires them, they have such a glossy skin and always look well. I am sure I cannot say too much for your food for all kinds of animals. Yours truly,

(Signed) James M. Hill.

The chief reason why you should use INTERNATIONAL STOCK FOOD TONIC in your Winter feeding is—It pays.

For sale by dealers everywhere in convenient sized packages, or in 25 lb. pails at $3.75 each.

THE HORSE

HOW TO SHOE DRAFT HORSES

The old adage, "no foot, no horse," grows more significant with the passing of the years. If these four words were more generally understood, it would mean thousands of dollars to the horse industry.

The perfect foot is not often seen. It is wide at the heel and of medium depth. The depth at the heel should be about one-half the length down the toe when the foot is in normal shape. The coronet should be round on the front feet and as nearly that shape as possible behind. A big, round foot indicates that the sensitive tissues covered by the hoof wall are healthy. The contracted foot, narrow at the heel, always means just the opposite. A full frog is a great asset to a big horse. It is the cushion which takes off the jars. Horses with extremely low heels are likely to go prematurely lame because of lack of frog. The inner part of the foot is not well enough protected from the wear and tear to which a draft horse foot is subjected to remain free from soreness long. However, there is less trouble with a thin-heeled horse going lame than a high-heeled one. Boxy feet, high at the heels, are sure to result in lameness sooner or later. They cause a horse to stand up on his pasterns too much and they always contract and sometimes pretty quickly. High heels and poor frogs always go together, for with such a shapel foot the weight of the horse cames on the hoof wall instead of on the frog. A frog is much like muscle tissue in that it never develops well without constant use. If one wants to grow a good frog, he has to take off the heel and let the frog down to the ground. Then the foot will widen out and grow a good, springy frog. The slope of the hoof in front should be about 45 degrees, the same as the set of the pastern. If kept at more than that angle, a horse cannot set down properly on his pastern. To give a horse a good elastic step his pasterns must set at such an angle that they will move up and down freely. There must not be a stilted step which comes with short, stubby pasterns and upright hoof walls.

How to Avoid Foot Troubles

The majority of all foot troubles are due to negligence. Few horses have bad feet from inheritance. Thirty minutes a week will keep the average farm horse's feet in perfect order. What farmer is there who does anything to his horses' feet unless they become so long that his horse can't walk easily, or unless they break off badly and cause lameness. Many good pure breds are permanently ruined by letting their feet grow without attention. The foot is like a sponge, very porous and sensitive to water. It will not stay in perfect order without moisture. Keep a horse in a stall and his feet will dry up and contract Never put oil on the feet, as that prevents water from entering the hoof wall. Pack damp clay in the bottom of the foot to hold moisture. If I can get it, I prefer white rock clay. This can be secured at most drug stores. Get the horse in the mud occasionally, so as to soften his feet. Where it is impossible to get a stallion out into a paddock, he should be walked out of doors and especailly when the ground is wet. Riding a stallion through meadows or pastures fhen heavy dew is on is excellent for the hoofs.

Always keep the foot as nearly level as possible. This rule applies to horses of all ages, and particularly to the young, growing colt. Sidebones are frequently caused by allowing one side of the hoof to wear off short. Then the weight is shifted to the short side, which invariably sets up inflammation, causing a sidebone sooner or later. Use a rasp and pinchers to trim a horse's feet, but not a chisel. One cannot use the latter and be certain that he is trimming the foot level.

Growing a Hoof Prior to Shoeing

Use the rasp sparingly on the hoof walls of a show horse, for if one wears away the glossy appearance, the hoof texture soon becomes dry and brittle and the feet go to pieces. There is no danger, however, from rasping the feet done only when he is shod, for usually he is not shod more than twice a year. Better keep very light plates on the show horse all the time to protect the hoof wall and allow it to grow. I always take a very light plate shoe and hammer it out until it is extremely thin at the heel. Then when one gets ready to shoe for show, he has a foot to work on. Too many people think that if they get a good horse shoer a few days before starting out to the fairs that he can fix up the feet. That oftentimes proves a sad mistake. In many cases it takes months of careful work to get feet in proper shape, and sometimes a year. Nobody can shoe a draft horse perfectly unless there is plenty of toe, and if not, it takes time to grow it. A heel that is too high cannot be cut down as it should be all at once. The work must be gradual or else soreness will result. It usually takes two or three trimmings to correct a high heel. If the quarter is lacking, keep the toe short, and that will throw more wear an the toe, less on the heel, and consequently the quarters will have a better chance to grow. Of course, if a foot is naturally well shaped and properly set, it doesn't take much of an effort to keep it that way. Always allow the frog to grow as long as it will. A great many people think that a horse isn't neatly shod unless the frog, bar and sole are pared away closely. No worse mistake was ever made, and any horse shoer who will do that to please his customer is doing nothing short of cruelty to animals. Never under any circumstances cut away the bar or sole unless it is diseased. Then it is necessary in order to treat the affected tissue with medicine and cure it. Nature has provided the frog, bar and sole to protect the inner and very tender parts of the foot.

The Colt's Feet

The colt should have his feet carefully watched, always keeping them trimmed level. There is very little that can be done to readjust the set of feet and pasterns on a mature horse but the young colt is easily suceptible to such changes. The set of feet and pasterns can be thrown one way or the other if it is done while the bones and joints are still young and flexible. If the colt stands too close behind or in front, keep the inside toe of the hoof a bit shorter than the outside and have the inside quarter a trifle higher. To throw the feet closer together, lengthen the inside of the toe and keep the outside quarter slightly higher than the inside. The mature horse that toes out badly in front, nigger heel fashion, is hard to help with shoes, for his legs do not set straight under him. The growing colt can be helped considerably by proper shoeing because hih joints are stil capable of being twisted slightly. Beware of the stallion with this fault, for there is no characteristic which draft horses transmit to their offspring with as much certainty as nigger heels.—By George MacLeod, Genesco. Ill., in the Percheron Review.

CARING FOR HARNESS

There is never a single week, nor hardly a day in the year, but what I have occasion to use some of the harness mending tools. On any farm where as much as half a dozen horses are kept with their full and complete equipment of harness of different kinds and several vehicles of different sorts, there is constantly coming up some repairing to be done. It is therefore important that one should keep a good kit of tools, and I don't doubt that almost all thrifty farmers have the same opinion.

While I don't have a shop for harness mending and such work regularly equipped. I do have a place where I can keep the tools and do the work; and while I don't claim to save a great deal of expense in actual money, I often save a lot of very valuable time by doing in a few minutes work that I would lose several hours in sending to a shop and getting some one else to do.

If I am in a right big hurry when

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Gombault's Caustic Balsam will give you immediate *Relief.* A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy
Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that." —Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

omething breaks, to mend and use it, ourse, one cannot make a lasting job r as nice looking as when sewed. I y to keep a bunch of different sized axed ends, so that I nearly always ave one to suit any sort of a job when get ready to use it, whether it is a ridle rein or the traces of a set of arness to mend.

As a clamp is a very necessary tool n sewing leather, one ought to have ne, but it is not necessary at all to uy it. The best way to make one is o have a hardwood block six inches ong, four inches wide and three inchs thick. Then have two pieces of ardwood board, very smooth, four nches wide and a half inch thick. One f these pieces can be screwed on to ne side of the block, and the other may be attached to the other side with a hinge.

The block should, as stated, be three inches thick, but should be only two and a half inches on the edge so that when the boards that form the jaws of this clamp come together the edges can get close enough to grip leather or other thin articles and hold them secure. In order to make the clamp hold what is put in it, the easiest way is to have a "tee bolt." That ie a bit with a long head. This head should be as long as the width of the jaws of the clamp. And on the other end of the bolt, under the nut, there should be a flat bar long as the board is wide, with a hole through the middle large enough for the end of the bolt to come through so the nut will hold the bar or strap against the side of the clamp, and it can then be screwed tighter without risk of splitting the wooden clamp.

Into the jaws of this I put two pieces of leather to be sewed together, so the line of sewing will be along the edge of the jaws of the clamp, and with awl and wax end, can do about as good a job of sewing as a regular harness maker.

I have found that it always pays to keep on hand some waxed ends, and just as soon as a rip is noticed in any of the harness, mend it at once. It saves time and it always makes the harness look better and last longer.

In this conection I will say that it is very important at the end of the working season to clean up and oil the harness. It will add a hundred per cent. to the life of it. I soak my harness that is to be oiled in warm water for one night. Then hang it up to dry, and while still soft, rub into it all the neat's foot oil I can get it to absorb. After it has been hung up for 24 hours I put on a coat of harness blacking of dull finish, and later same with polish in it.

It pays to do all this, not only in the longer life of the harness, but in the satisfaction of having your rig look nice and well kept. When I drive I want my outfit to look as wel as anybody's, and by careful management I am able at all seasons of the year to have them in nice shape.—R. B. R.

THE MAN, THE HORSE, THE TRACTOR—HOW THEY FIT TOGETHER

There are two sides to every question. A strong argument in any case is that a man must have some natural talent if he gets the best there is out of anything. Some men are farming who should never get within striking distance of a horse. They do not seem to realize that a dumb brute has a sense of feeling, and as a natural result every action of the lord of the farm is looked upon by his stock with a sense of fear. The same can be said of tractor-owners. I have seen men who could climb into the cab of a tractor and at the end of one season it would be ready to sell as scrap iron. The man who succeeds best with a tractor is one who can find slight troubles and remedy them by readjustments and in that way keep his tractor in good running order at all times. I was reared on a farm, and with the exception of four or five years have lived on a farm all my life. Since horses have been in practical use on farms for considerably more than a century, every farmer knows just what they are capable of doing. Many tractors are practical and give satisfactory results. With proper care and attention they will stand up to the hardest kind of usage for years. Since there are freak tractors that are not practical, many farmers are spending money for a bit of experience that will last them for years.

There is a vast amount of work on the farm every season that requires too much time and expense when done with horse-drawn implements. A farmer can dispose of his surplus horses, and keep just enough to do the lighter work on the farm, such as cultivating, feeding and some plowing in the busiest season is necessary. He can have a light-weight tractor that will pull from two to four plows (depending on the size of the farm) for the heavier work. So long as farmers continue to farm, there are two things that are with them to stay: horses and tractors. Each has its place on the farm. There is only one thing to work against the tractor and that is for the price of fuel to become prohibitive. We must look at that with a sense of reason, for feed for our horses is getting higher if we consider ever-increasing land values.

The Boston superintendent of police has issued an order instructing all officers to enforce strictly two sections of the city trffic regulations; the one forbidding all cruel beating or abuse of horses, and the other prohibiting boys under 16 years of age driving any licensed or business vehicle.

PREPARING EGGS FOR STORAGE

The Lime and Water-glass Methods

It will soon be time to preserve eggs for next fall and winter. May is the best month for this as eggs are practically all new laid and in good condition at this time.

The underlying principle of all the methods of properly preserving eggs is to control the growth of bacteria inside the egg. In selecting the eggs to be preserved in water glass, choose those only that are sound and clean. Use no cracked eggs; for they are bound to spoil and thus taint all the eggs in the same pack. Use only clean eggs; ;because eggs dirtied with manure will introduce manure bacteria into the water glass. These bacteria in time will penetrate the eggs and spoil them; since the water glass is used not as a germicide but as an antiseptic. If eggs are dirty when taken from the nest, it is not advisable to wash them for the purpose of putting them down later. The reason for this is the fact that on the outer surface of a fresh laid egg there is a mucus, which, in drying, partly seals the pores of the eg through which bacteria may enter. Washing removes this protective coating of mucus and thus makes such eggs, even though clean, more liable to spoil than those not washed. It is important therefore, to keep the nests clean.

One of the cheapest, most easily prepared and most effective means of preserving eggs is by lime water solution.

In making lime water solution it is important that good fresh lime be used. Use two pounds of fresh lime and slake in a barrel or tub by adding about two gallons of water. After the lime is properly slacked sufficient water is added to make five gallons of solution, which will be sufficient liquid to preserve 30 or 40 dozen eggs. After slaking it, the solution is allowed to settle. After it has settled, it is stirred up again. This is repeated a few times, after which the clear liquid only is poured off into the crock. The best plan is to put about six or eight inches of the solution in the crock before putting in eggs By doing this, there is les danger of crackinp any of them. The liquid tends to lift them slightly. The eggs need not be put in any special way. The crock should set level and then be filled right up to the top with the liquid. Put in enough so it is just on the point of running over. After this is done melt about four ounces of paraffin, and pour it on the top. This cools and hardens and forms an air tight covering which prevents any evaporation. By first boiling the water used in slaking the lime its preserving qualities may be slightly improved.

Water-glas has also given fairly good resuts, but this preservative is more expensive, and the eggs do not retain their flavor as well as those kept in lime water.

Some people put salt into the lime water, but this and several other methods tried have all given less satisfaction than the lime-water and water-glass methods.

The Water-Glass Method

Water glass, which is technically known as sodium silicate, is the basis of the preserving fluid. It is a very heavy, syrupy liquid, nearly colorless. It may be purchased of almost any druggist. One gallon, diluted according to directions, one part to eight parts of water, is sufficient for approximately 30 dozen eggs. An earthenware crock, with a properly fitting earthenware or tincover, is one of the best recpetacles to use. Metal should not be used in contact with water glass. Befroe putting in the water glass or the eggs, scald the crock thoroughly.

All eggs that are put down, except possibly those that are taken directly from nests visited daily, should be tested for freshness. The following method is simple, requiring only materials at hand, and can be carried out accurately with no previous practice. At the larger end of the egg there is a small chamber containing air, and from the time the egg leaves the hen this air chamber slowly becomes larger, due to the evaporation of the contents of the egg. The larger the air chamber becomes the more readily the egg will float. To carry out the test, place approximately one quart of water, which has been boiled, in some small enamel or earthenware container. To this, with constant stirring, add enough water glass so that a fresh egg, known to be not over 5 or 6 days old, will just sink to the bottom. The amount of water glass that must be added to the water will have to be determined by experiment. Into this solution the eggs my be placed in twos and threes. All that float should be discarded, and tried out for possible household use in the near future. An egg which is 10 days or two weeks old will generally float slowly near to the surface of the solution. One which is fairly spoiled wil bob up to the top almost like a cork. Later this same test solution, after proper additional dilution, may be used as a part of the preserving fluid.

The Preserving Solution

The preserving solution is prepared by adding one part of water glass to eight parts of water, which has been boiled for five or ten minutes just previously and then cooled. Sufficient of this solution should be poured into the crock to fill it half way or little over. As the eggs are placed in the solution, the level will be raised nearly to the top of the crock. The solution should be prepared fresh from year to year.

The eggs should be placed in this solution carefully, lest any be cracked, if the silicate solution affects the skin of the hands unpleasantly, a wire spoon or similar device may be used to lower the eggs into the preserving fluid, in filling the jar with eggs, care should be taken to see that all are submerged in the water glass, and re, main so, as the solution thickens.

It is not necessary that all the eggs be put down at once, especially where gegs are collected daily from a small number of hens which supply the reserve for winter. The solution may be made up, put in the crock, properly covered; and the eggs, taken day by day from the nest, may be added to the solution.

The eggs may be removed from the soltion as needed, and rinsed in cold water. In this condition, however, they cannot be boiled without exploding or cracking. This is due to the fact that the pores of the shells have been thoroughly sealed by the water glass. As the eggs heat, the air chamber expands, bursting the shell. This difficulty may be avoided by pricking a pin hole in the large end of the egg, thus giving the air inside a chance to escape as it expands with the boiling. All water glass on the market is alkaline to a greater or less degree. The eggs in the crock should be stored where the temperature is below 60 degrees F., if possible, and where direct sunlight will not fall, preferably in a dark place.

Keeping Qualities

The water glass method of preserving eggs has been in general use for a number of years, and experience has shown that eggs so preserved are usable for cookinig purposes a year, two years and even four years after being immersed in water glass. It is not advisable to expect them to keep in good condition longer than a year, however. The total cost of preserving eggs in case lots by this method should not exceed two cents a dozen.

Spanking Doesn't Cure!

HENS THAT LAY NEED EXERCISE

A flock of hens need exercise in the winter and if the scratch grain is thrown on a bare floor, the birds will not starve but they will not keep in condition to lay. The hens that are anxious to exercise seem to be the best layers. Watch the roosts in the morning at sunrise and note the birds that come down first and begin to scratch. They are apt to be the birds that will produce the most eggs Watch the roosts at night and note the slacker hens that go to bed an hour before it is necessary. They are apt to be the lazy hens that do not like to scratch and such hens are usually poor layers.

The one form of exercise which a hen instinctively enjoys is scratching for grain. A deep littel is necessary in the poultry house in the winter to give the hens the exercise that they receive in the summer from running and scratching on the range. As it is broken up, more can be added and when it is damp and dirty it can be used to fertilize the garden, mulch strawberies or spread on the fields. Dry leaves are sometimes used as litter but they are soon broken up and unless a farmer is in a district where there are many large trees, it takes a long time to gather enough leaves to make a deep litted in the poultry house. The use of automatic feeders gives the hens some exercise as they have to jump and peck to release the grains and then scratch for them as they fall in the littel.

The flock of hens which eats its fill and then humps up in a corner

CARBONOL

A Blessing in the Home

IF there is one thing needed around the home or farm, it is Carbonol. Good in a hundred different ways. Helps house cleaning. A few drops in a pail of water makes a bucket of antiseptic, grease-killing liquid. In solution, it is wonderful for cuts on yourself or your live stock. Drives away flies, disinfects the sick room, m kes barns, stables and henneries sanitary. You should not be without it. In bottles.

Get some now.

There is a dealer in your neighborhood who sells these and other Barrett products. If you don't know him write us direct for prices and particulars.

THE BARRETT CO., Limited
(formerly the Carritte-Paterson Mfg. Co. Limited)
St. John, N.B. Halifax, N.S. Sydney, N.S. 13

of the poultry house, is not usually a paying flock. Some of the birds are in line to become over-fat and others are weakened by the lack of exercise and this makes them less resistant to colds and other diseases. The difference between flocks of healthy laying hens and lazy non-producers may depend upon the amount of exercise those hens receive. It pays to make the hens scratch.

PATRIOTISM IN THE POULTRY YARD

If it had not been for the thousands of women all over the land who keep hens, the poultry industry would have suffered a very severe setback the past year. Commmercial poultry keepers everywhere found it necessary to reduce their stock owing to the high price of grain. Fewer chickens have been raised, and fewer laying hens are kept. The salvation of th industry, therefore, is in, the hands of backyard poultry keepers, who are largely women.

It is highly important for the good of the country that as many laying hens as possible be carried through the laying season. The eggs are needed to replace meat. Moreover, it is esential that a great many chickens be hatched next spring. In some of the countries across the water, the poultry business has been almost destroyed. In France, the land of the epicure, where special attention was given to developing meat breeds, few fowls are now to be found, except mongrels and nondescripts. n lEngland poultry rations have been cut to such an extent that the hens are being fed on all kinds of odds and ends, even to banana peelings. America is being looked to to restock all of these foreign countries. tI will be necessary to send to Europe great numbers of breeding pens, and there will be a heavy demand for eggs.

At the same time patriotism and econonmy make it necessary to eliminate all unprofitable fowls. The woman poultry keeper should make certain that none of the hens are drones. Such hens eat almost as much as the others, and yet do nothing to pay their way. Thousands of bushels of grain could be saved if all the non-laying hens should be weeded out. Every woman who works daily with her flock soon gets a good idea of which are laying.

Hens of the breeds having yellow legs and colored ear lobs change in appearance very plainly after they have been laying some weeks. Gradually the legs and ear lobs fade out. This is because the pigment or fat is used for eg production. The natural yellow color of the skin also gets much lighter. This is especially true around the vent, as laying progresses. The beaks of some hens are dark colored at the top, but the change can noticed on under parts. Bright red combs are likely to be an indication that hens are laying; but the well-groomed, neat-looking bird which usually is the vrst to attract the eye of the visitor, is more likely to be a loafer than the raged, untidy hen that reminds one of a tramp.

The pullets which began to lay first in the fall have a special value for breeders. As a rule, it is not wise to carry any hens longer than two years. Most breeds wil lay enough eggs to pay for keeping them a second season. Many women find it a good plan to renew half of their flock each season, so that every winter they have one pen of yearling hens. It is better to breed from the hens than from the pullets, using a cockerel with them. This is especially true if the pullets lay heavily through the winter. They are likely to be so run down in the spring that their chicks will lack stamina.

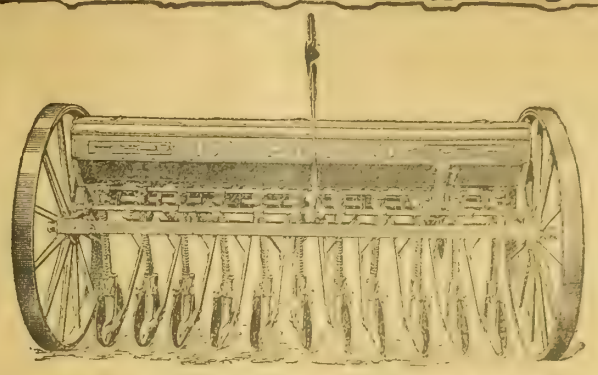
Let the poultry keeper keep her houses in order. The ideal house has fixtures which can be taken down in a moment, thus leaving all the walls free. Perhaps it is hardly necessary to say that unremitting warfare on insect pests must be kept up. It is impossible to get good results from hens that are covered with vermin. Most hens will keep themselves reasonably free from body lice if they have a dust bath, but they have no protection from the red mites, as these tiny creatures spend their days hiding under the perches, and in crevices in the walls, crawling onto the birds at night. These mites are naturally white, but become red when filled with blood. In a neglected hen-house they are often present in almost unbelievable numbers. The common remedy of the poultry keeper for all vermin of this kind is kerosene containing a little carbolic acid. tI can be used as a spray, or applied with a brush. Unles it is used every few weeks, though it has but little value. Much time and labor will be saved by substituting one of the coal tar products which can be put on with a brush, and one application of which will last four or five months. Any house can be kept practically free from red mites by this simple means.

Be sure that your houses are free from rats, too. It would be impossible to calculate the amount of the loss in grain each year from the depredation of these rodents. It surely runs into the millions, and such a loss should not be tolerated at the present time when food is so necessary for human beings. The watch for rats must be endless, because they are likely to appear over night. It is not unusual for a single rat or a family to travel a mile in twenty-four hours and set up house-keeping in a new abode. If you are wise you will keep your grain hoppers closed at night, and will feed the coarse grain in a litter several inches deep. Litter feeding is advisable anyway, because it makes the hens exercise, but it has the added advantage of protecting the grain from the rats. Of course a house with a cement foundation can be made rat proof, but you can protect any house by sinking wire with a fine mesh two feet into the ground all around. This wil lbe of no avail, however, if you do not close all doors and other openings near the ground at night.

The medium sized fowls are best if they must be kept closely confined as in a back yard. The very large hens like the Light Brahmas and Langshangs get too fat, while the small breeds, like the Leghorns and Anconas, are likely to develop bad habits, like egg and feather eating. This does not mean that these breeds cannot be kept, but that American breeds like the White Plymouth Rock, the Rhode Island Reds, and the Wyandottes are easiest to handle. There is no reason why hens of these breeds should not be kept in a house without any yard at all if the are allowed four square feet of room for each bird, and if the open-front of house is adopted, so that there will be no lack of fresh air.

Of course the qusetion of feeding is of greatest importance. Everything possible should be done to save grain. It will be found that vegetables can be used in much larger quantities tan in the past, especially if a fairly large proportion of beef scraps is used in the mash. In many places mangels and red beets can be bought cheap. These vegetables can be stored in sand in the cellar. All sorts of waste from the house can be utilized. Apple paring, for example, small potatoes and table scraps can be used advantageously if run through the meat grinder or else cooked and mixed witha little bran so as to make a crumby mash. Do not feed potatoes raw.

Cabbage is often used, but it is hard to keep very long in winter, and too much of it tends to impair the flavor of the eggs. Oats are easy to sprout, and if fed when about half an inch long, will provide green food while not wholly robbing the grain of its natural substance. Sprouted oats or sprouted barley are very useful feeds. Almost any of the grains can be used. Select those which are cheapest and most available. The writer has had very good success when he has fed only oats and cracked corn, with a mash of bran and beef scraps, supplemented by vegetables and green stuff. It has been learend during the last two years that there are no hard and fast rules for poultry feeding.



Deering Drills
for Good, Quick Planting

DEERING drills do away with delay at planting time. They have a workmanlike way of sticking steadily to business until the job is done that does away with most of the terrors of our short planting season.

Deering drills first make a furrow just deep enough, then plant the kernels regularly, according to the quantity per acre you want to sow, and then cover them thoroughly to an even depth. They are light-draft machines with strong frames, large, easily-filled grain and fertilizer boxes, and accurate double run feed. They are made in single disk and hoe styles with 11 and 13-furrow openers.

The **Deering** local dealer is the man to see when you are ready to look at drills. See his sample drills, or write to us for a catalogue showing all the good features of **Deering** drills.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

Oh, heart of mine, we shouldn't worry so!
What we've missed of calm we couldn't have you know!
What we've met of stormy pain
And sorrow's driving rain
We can better meet again
If it blow.

—Susan Coolidge.

HER NEW YEAR'S DISCOVERIES

(By Sinclair Dunlop)

I suppose it is real, Sis, and that I really am awake and sitting here in conventional evening clothes, waiting for Bob to call around in his car and whisk me off to that dinner, but I can't quite settle myself to think that it won't all end in a twinkling."

"The dinner? Well, should say not if our respected uncle the Colonel is to make one of his famous speeches. You may settle yourself for the, once he gets started," and with a laugh Marcia Andrews swung herself round on the piano seat and faced her brother. "Sometimes, Phil, I do believe you are sorry it is all over, and you are safe and—well, if not quite sound, at least looking like your old self again in spite of the old heart weakness. If you only knew how we felt this time last year. It wasn't like New Year's at all."

"Wasn't it—I mean, of course, it wasn't," and Phil roused himself and peered out through the curtains to make sure that it was Bob Carson's car that was drawing up at the curb in front." "tI wasn't much like anything that I have ever known before, last New Year's wasn't," he went on, "Why that was the night—yes, coming, Bob. Be with you in a second," and not waiting to finish his sentence, Phil Andrews, late Sergeant B. Andrews of the X Battalion, Canadians, hurried into his coat and with a hurried word of good-bye, made his way to the door.

"Another story lost, and just as I was sure he was going to tell it. That's always the way. Someone has to interrupt every time he starts to tell us anything about the war, and dear knows it is hard enough to get him staraed to talk about it at all. I think Bob might have waited just a minute."

As Phil Andrews settled down into the comfortable seat of the waiting car outside, his sister pulled a comfortable chair up before the fire and reached for the magazine on the colored cover of which the light of the shaded table lamp was shining.

"A jolly New Year's Eve it's going t obe, I must say," she murmured, as she listlesly turned the pages. "Mother hurried oy at a moment's notice to the country to nurse Aunt Mary, Anne stilil working hard in the hospital, and Phil, who might have made things seem homelike and real, running off to an old military dinner. I don't believe there is a person in this whole city quite so desolate as I am, and on New Year's eve, too. I believe that even that frumpy little woman with the cross baby in the apartment above is better off. She is at least kept so busy with the baby that she doesn't have time to be lonely, I guess.

"If I were like the people in story books, or even like Anne, I suppose I'd go out and hunt up someone as lonely as myself—it would be impossible to find anyone lonlier—but I'm not—and—"

A shary cry from the apartment above interrupted Marcia's thoughts.

"That cross baby again. You'd think she'd try to do something to keep it quiet. People who live in apartments ought to remember that there are others to be considered."

She trned to her story again, but instead of ceasing, the cries from above grew louder, until Marcia, with the air of a martyr, laid down the magazine again and half rose from her chair.

"I believe I'll telephone up to her to please do something to keep her baby quiet. She has no right to disturb other pepole like this. If I only knew her name I would. I noticed it on the letter box the other day. Ball, or Ball or something like that, I believe."

Ten minutes later, when, after a short lull, the cries broke out afresh, Marcia not only rose from her chair, but walked determinedly toward the door.

"That settles it. If I have to stay in and spend a dull evening by myself, at least it is going to be a peacful one, and it isn't going to be spoiled by the howls of a cross baby. I'll run up and ask her to please keep it quiet."

The corridor into which the door of the Andrew's apartment led was unusually still as Marcia stepped into it and walked toward the elevator shaft. No light showed above the doors of No. 5 or 7, and she knew that No. 6, the apartment next their own, was still vacant. Pressing the button that brought the elevator up to the second floor, she waited until it came noiselessly up, then stepped in and pulled back the simple lever that operated the car. At the third floor she stepped out and turned toward Apartment No. 12, from behind the door of which the sobbing voice of the baby still came to her ears.

"I won't ring the bell, I'll knock and just ask her to please keep the baby quiet," she decided as she made sure of ther ight door. "I'll—"

But she had no time to decide what her next move would be. Almost before she had ceased knocking, a voice, which sounded plmost as tearful as the baby's, called out to her, and before she quite realized what she was doing, Marcia had pushed open the unlocked door and was standing in the hall of the apartment above her own.

"Oh, I'm so glad somebody has come," the voice went on. "I was afraid no one would, and I just didn't know what to do. It is so good of you, Miss Andrews," as Marcia came into the light.

"Yes—I'm Miss Andrews, and I came up—"

"It is more than good of you, Miss Andrews," and the owner of the voice tried to rise from the couch where she had been lying. "I was afraid everyone had left the building—it being holiday time and so many people away, you know—and I just didn't know how to get help. If we only had a 'phone, I could have called a doctor or someone, but we felt that we could get along without the luxury of a telephone until my husband was back at work again, and—"

"Is it your foot" asked Marcia, anxiously, quite forgetting in her suprise the errand on which she had come. "Have you hurt yourself?"

"Yes, it is my foot. I just don't know how I hurt it this time. My ankle has always been weak since I sprained it badly one summer, and now and then it gives out on me again, and I simply can't move about on it. I was hurrying around this evening getting my husband off—it's the first time he has gone to anything since he came home, you know—and I remember turning over on my ankle on the freshly waxed floor in the hall, but baby had to be put to bed and so much else to be attended to, that I just kept on until the pain got so bad that I had to give in. I have never been quite alone when it happened before. Of course, I wasn't alone this time, either, but I just couldn't spoil my husband's first evening out by bothering him about it, and I thought perhaps it wsan't going to amount to anything. I've never lived in an apartment before, you know."

Marcia didn't know. In fact, Marcia was appalled, as the little woman rattled on nervously, at the number of things she appeared not to know, not only about the other occupants of No. 12, but about the other dwellers in the Coronation Apartments.

"I'm sorry," was all she could say but with a motion which she afterwards declared was quite as effective as if she had been Anne herself, she bent down and began to roll back the stocking rom the swollen ankle. "I'm so sorry. Has your husband been ill?"

"I'll? Why no, that is, he has been perfectly fine since coming back to Canada, and one would scarcely even notice that he limped. He is getting so used to the artificial limb now, too, and he doesn't feel nearly so sensitive about it. The doctors say his case is a marvel. They were afraid for a time that they were not going to save his life at all, and he says that if it hadn't been for the thoughts of seeing Baby Boy, who was born a few weeks after he went away, and of coming back to me, he wouldn't have even tried to pull himself together and get well. Now that he is back he will hardly allow Baby Boy out of his sight for a minute. I tell him he is spoiling him, and that he misses him so after he goes out each time that nothing will satisfy him. You should have heard him cry tonight, after his Daddy had gone."

Marcia might have added that she had heard him, but somehow, as she looked from the little woman whose ankle she was gently rubbing to the blinking baby now staring at her with wide-eyed curiosity, all memory of her annoyance seemed to have fled.

"He—seems to be quiet enough now, poor boy."

"Yes, he only needed to have his attention taken off his own small troubles, and when he saw his mother lying here and not trying to amuse him

in the least, he didn't know what to make of it, did you, Baby Boy?"

A gurgle of assent was the only answer from the cot in the corner, and as Marcia bustled about, finding hot water to bathe the swollen ankle, and cotton with which to bind it, she felt that she must surely pinch herself to make sure that she was awake.

Then somehow Marcia began to feel that she had known the occuants of No. 12 for years and the sore ankle was almost forgotten by the little woman who sat propped up in the most comfortable chair in the room and drank the hot tea that her neighbor made for her.

"You seem to know just how to go about it," she said ahppily, and there is a knack in making good tea. I know there is."

It was an hour later when, Mrs. Bald tucked safely away in bed and the night light turned so that it would not shine on the sleeping baby in the cot. Marcia Andrews tiptoed out of Apartment No. 12 and, forgetting that there was such a thing in the world as an elevator, walked to the floor below.

"I don't know what Phil will say," she laughed softly to herself, as she opened the door of No. 8 and went in. "I had planned such a cozy New Year's dinner all by ourselves, with a car ride out to call on Bess Pringle in the afternoon. He has been so sensitive about meeting strangers since he came home, too. But then I can't help it. I simply couldn't sit there and think of that nervous little creature trying to get up a dinner and mind a fretful baby, with her foot in that condition. The husband is a soldier, too, so perhaps Phil won't mind so much."

The clock in the big firehall at the corner near the Coronation Apartments had just rung twelve when a step in the corridor told Marcia that Phil was home.

"Funny I didn't hear Bob's car," she said, as she roused herself from the doze into which she had fallen. "He usually toots the horn when he stops, but I suppose being so late he had the decency to be quiet for once. Why—he must be coming in," as her brother's voice could be heard with some of its old time ring in it.

But it wasn't Bob Carson who followed Phil into the room. The man who stood in the doorway waiting to be introduced was a complete stranger to Marcia, and yet there was something strangely familiar about him too.

"Oh, you're still up, Sis. Well, I'm mighty glad, though of course you ought to have been in bed hours ago getting your beauty sleep. But even if you had been, I'd have to waken you this time. Who do you think I have here?"

"Why—I—I don't know, Phil," and Marcia flushed in her embarrassment until her proud brother thought she had never looked prettier.

"No, of course you don't, at least not by sight, but you know a good deal about him by hearsay. This is Bill Bald, old Baldy who saved my life. There he was at dinner, sitting there as alrge as life, and when at last they decided that we must tear ourselves away from one another, what do you think I discovered? You'll never guess."

Marcia's brain was in a whirl, but as she looked again at the tall man, whose hand was stretched out to her, she remembered a photograph that stood on a mantel piece above a couch in Apartment 12, and, although she would not for words have spoiled Phil's "surprise" by guessing, she knew at once who Baldy was.

"I've found that Baldy lives here, too. Right in this apartment house, Sis. He has a wife and a baby, too, and we aren't going to do a thing but have a good time now that we are together again. Who'd have thought when we were sitting in that miserable dugout in France last New Year's day, trading good things that had come in our home boxes, that this New Year's—"

"You'd be dining together again in Coronation Apartment Toronto," finished Marcia happily. "Yes, I've been discovering things tonight, too, and Mrs. Bald is one of them. She has promised that they will come to dinner with us tomorrow, or rather today, I spppose I should say."

"Hurrah! Then it is to be a real happy New Year after all. Sis, you're no end of a brick to have thought of such a wonderful surprise. I didn't know you knew Baldy's wife," then as the door closed after the man to whom he owed his life. "But what are the other discoveries you have made tonight?"

"Oh, several," was the half laughing reply "but the biggest of all I think was that a neighbor may be one living up or down from one, as well as across or next door."

"Doesn't sound like much of a discovery, but you always yere strong on queer speeches anyway, Sis, and this is about as queer a one as you've ever made."

But Marcia was listening to a happf peal of laughter that come from Apartment 12, and really didn't seem to hear him.

REMOVING INK STAINS FROM COLORED FABRICS

Ink stains can usually be removed from colored fabrics by soaking the stain in either sweet or sour milk; but unless the colors are fast they will probably fade to some extent.

As soon as posible after spilling the ink. the spot should be put in the milk. As the milk becomes discolored it should be poured off and replaced by a fresh supply. It will take a day or two to remove all the stain. If the material is gathered together just above the stain and wraped tightly with many turns of cord, the milk will not spread and disfigure so large a portion of the garment.

Red ink may be removed by soaking the stain in clear water to which ammonia has been added. The water will need to be changed several times.

India ink may be removed by washing the material in a warm soap solution.

Ink Stains on White Cotton or Linen Material

In many instances ink stains may be removed by soaking the stain in sweet or sour milk for a day or two. When this method is not effective, the material containing the spot should be placed on a shallow dish and a saturated solution of oxalic acid poured over the stains. The material should remain only a minute or two in the solution and then be thoroughly rinsed in clear water containing a little ammonia. If blue stain still remains the material may be placed in javile water for a few minutes. It should then be thoroughly rinsed in several waters.

BE COURTEOUS OVER 'PHONE

Let us at all times be courteous. For some unknown reason many people who profess to be well bred feel that they are privileged to be rude when talking over the telephone. For instance it is not uncommon to answer the phone and be greeted with the "Who is this " It is not at all probable that that same person would approach you on the street with the remark, "Who are you?" Yet the effect upon the person interrogated is much the same. Many persons object to giving their names or even telephone number from which they are talking. When one is given the desired connection by "Central" it might be well to say, "this is John Jones speaking, may I talk with Mr. Smith, please." Mr. Smith then knows with whom he is conversing or if some one else answers the phone Mr. Smith may be informed of who called. Many other instances might be cited in which conversation over the phone could be improved upon.

CONSTIPATION, LIVER COMPLAINT, BILIOUS SPELLS.

When your liver becomes sluggish and inactive, the bowels become constipated, the tongue becomes coated, the breath bad, the stomach foul and sick, and bilious spells occur on account of the liver holding back the bile which is so essential to promote the movement of the bowels, and the bile gets into the blood, instead of passing through the usual channel.

The only proper way to keep the liver active and working properly is to keep the bowels regular by using Milburn's Laxa-Liver Pills. They work smoothly and gently, and do not gripe, weaken and sicken as so many laxative pills do.

Mr. James P. Colter, Hartford, N.S., writes:—"I have used Milburn's Laxa-Liver Pills for constipation and liver complaint. At one time I used to have a bilious spell every little while and once was in bed for four months. Since taking your pills, the bilious spells have left me. I have recommended Laxa-Liver Pills to many others here, and they are growing in favor every day."

Price 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

COLDS, LA GRIPPE, AND THEIR COMPLICATIONS

(By William H. Galland, M. D.)

During the winter and the spring months colds, and la grippe become exceedingly common complaints. The children are particularly susceptible to colds on account of the great sensitiveness of their skin.

Just at this time of the year there is raging in this country a terrific epidemic of la grippe. It has been classified under the name of Spanish influenza. In reality it is the old-fashioned influenza or la grippe, appearing in a more virulent form. By virulent, I mean that the germ which is causing this present epidemic is a more virulent germ, due to peculiarities which we do not understand; and as a result people afflicted with la grippe are more acutely ill than with the ordinary old-fashioned influenza.

Remember that a simple cold is not la grippe. It is a grave mistake to confuse the ordinary colds with which people suffer with the true influenza, and it is important that you should be able to distinguish between in the beginning whether your child is a victim of a cold or whether the attack is one of true la grippe. This much is sure, the ordinary cold, properly treated in the beginning often can be quickly broken up, and it is true that what often apepars to be an ordinary cold in its beginning may prove within twenty-four hours to be a severe case of la grippe.

A cold or an attack of la gripe is due to an infection, just as much as measles or scarlet fever or diphtheria is due to an infection. The infection lodges in the muscous membrane of the nose and throat and the cold develops. Simple, ordinary infections produce simple, ordinary colds but if the true influenza germ once gains a foothold on the mucous membrane of the nose or throat, there develops a case of true la grippe.

Let us speak first of a simple cold, or what is commonly called coryza. We know that colds are due to the action of bacteria, because, as you yourself have often observed, when one member of the family becomes affected, several or even the entire family will suffer from colds within a short space of a few days.

In children, the principal thing you should do to avoid their catching cold is to tkeep them out of drafts, especially a draft blowing directly upon the head of the young baby. Babies and children should be kept in the outdoor air as much as possible, because fresh air will be your greatest prevention for colds. A child never should be allowed to go in over-heated and crowded places. The crowded school-room and the mofing picture house, especially the latter, are responsible for the dissemination of a great many contagious diseases. This is true especially during the fall and winter months. If one of your children contracts a cold, keep that child away from the rest of the family for two or three days until the cold has become entirely broken up. This prevents the infection from being carried to others. A child with a cold who coughs or sneezes into the faces of other children is surely transmittinf that infection to the other children.

The first symptoms of a cold are watering of the eyes. This may not always be present. Sneezing is common with running of the nose, with a tendency for the child to talk with a nasal tone. Usually, there is a little fever, a half degree or a degree. A cold is very troublesome in a baby because it obstructs the breathing and makes it extremely difficult for the baby to nurse.

A danger that you must always think of when there is a cold in the baby's head is an inflammation of the ears. If you find the little one constantly putting its hand to one of its ears and crying out as though in pain, do not hesitate to call your physician's attention to it at once, because the infection from the nose and throat so often travels up the eustachian tube, which leads from the throat to the middle ear, and pus forming in the middle ear will many times forcibly rupture the ear drum and leave the child with permanently impaired hearing, often actually deaf. The physician who recognizes this condition at once and opens the ear drum, to allow the pus to escape through a small incision, will save your child's hearing.

You naturally ask, "How is one to tell whether the attack is simply a cold or true la grippe?" Before speaking of the proper treatment of a cold, we will takeup the question of la grippe and how it differs from a simple cold in the head. La grippe, when it attacks a child, comes on with more acuteness, the child is more seriously ill. The fever in a simple cold, is one-half degree to a degree. but in la grippe the fever will rapidly mount to 102, 103 and sometimes higher. There will be the same running from the nose and probably the water discharge from the eyes, but there will be in addition, great prostration. The child will appear to be acutely ill, and as in adults who are attacked by la grippe, there is a severe headache and pains in the muscles of the arms, back and legs. You realize that a young child may not be old enough to tell you that it has a severe headache, and pains in the muscles of the arms, back and legs, but the child afflicted with la grippe when old enough, always complains of severe headache. There is practically always a sore throat and accompanying this sore throat in the first few hours, is a sharp, dry, harsh cough. This cough comes from irritation of the throat and of the mucous memberane of the bronchial tubes.

You will hardly ever make a mistake in distinguishing between a simple cold and la grippe, because of the difference in the severity of the symptoms. The child with a simple cold will continue to want to be up and play around the house, while a child with true la grippe is acutely and dangerously sick, and almost always prefers to remain in bed and usually cries if attempts are made to lift it about. This is because the muscles are so tender and painful that the lifting of the child causes it great discomfort.

When we come to the question of treatment, the first great step is prevention. That is why all our large hospitals today are in quarantine. Prevention in la grippe means quarantin eand it means a strict and rigid

Messages of Hope to the Old Folks

ISIDORE COMEAU SAYS DODD'S KIDNEY PILLS CURED HIM

Though Sixty-eight Years of Age, His Kidney Disease is Completely Gone, and He Gives All the Credit to Dodd's Kidney Pills.

Green Point, Gloucester Co., N. B., Feby. 2nd (Special.)—"I am sixty-eight years of age, but well and hearty.

"You can tell everybody that Dodd's Kidney Pills cured me of kidney disease completely.

"I want everybody to know how thankful I am to Dodd's Kidney Pills."

Thus does Mr. Isidore Comeau, well known and highly respected here, express his gratitude to the remedy to which he gives the credit of making him well. And his words are a message of hope to the men and women of Canada who are nearing the allotted span of life.

It is the kidneys that first feel the wear and tear of a long life. Theirs has been the work of keeping the blood free from those impurities that are the seeds of disease.

Nine-tenths of the ills from which the old folks suffer are directly due to weak or diseased kidneys. Ask your neighbors if Dodd's Kidney Pills are not the remedy they have been looking for.

SOLVE THIS PUZZLE

23	8	5	14	•	7	5	18
13	1	14	25	•	9	19	•
4	5	6	5	1	20	5	4
•	1	14	4	•	14	15	20
•	1	•	13	9	14	21	20
5	•	2	5	6	15	18	5

This foretold when the War would end. What does it say?

CAN you work this out? Do you want to know how it was decided long before peace came when the war would be over? The answer is contained within the 48 squares above. What is this answer? Solve it and valuable prizes await you.

HOW TO SOLVE IT

The above squares hold the answer. It is in one sentence of nine words, containing forty letters. Each letter is represeated by a number, and that number is the position of the letters in the alphabet. For instance, A is represented by the figure 1, as it is first in the alphabet, and so on. Now, to help you get started, we will tell you that the first letter in the puzzle is "W," because W is the 23rd letter in the alphabet. Get to work and figure out the words in the sentence, and try to find the answer to the great question, "When will the war be over?" It is not easy, but it is worth while trying for.

THE PRIZES

PRIZE	VALUE
1st—Five Horse Power Auto	$150.00
2nd—Dandy Folding Camera	25.00
3rd—Magnificent Gold Watch and Chain, or Girl's Wrist Watch	15.00
4th—Lovely 36-inch Doll, handgowned, and beautiful English Doll Carriage	10.00
5th—Electric Projectoscope. Better than a magic lantern. Will show any picture or postcard photo on screen	7.50
6th—Full-size Football	5.00
7th to 10th—Self-Filler Fountain Pens, each $2.50,	10.00
Also 10 Extra Prizes for Boys and Girls, each $1.25,	12.50
Total Value of Prizes	$235.00

Copy your answer upon a plain white sheet of paper as neatly as you can, because neatness, spelling, hand writing, and punctuation count if more than one answer is correct. Put your name and address in the top right hand corner of the paper. If you have to write a letter, or show anything else, put it upon a separate sheet of paper. We will write as soon as your answer is received, and tell you if your solution is correct, and also send you a complete illustrated list of the grand prizes that you can win.

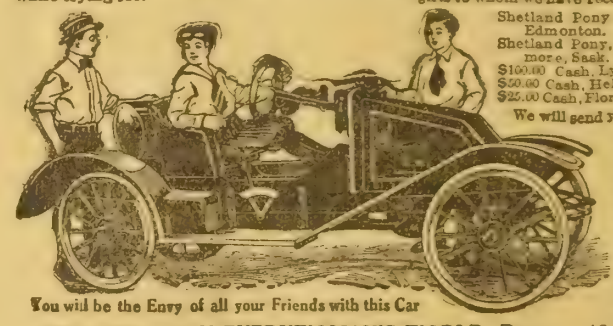
What Others Have Done, You Can Do

Here are the names of only a few of the boys and girls to whom we have recently awarded big prizes—

Shetland Pony and Cart, Helen Smith, Edmonton.
Shetland Pony, Beatrice Hughes, Hazenmore, Sask.
$100.00 Cash, Lyle Benson, Hamilton, Ont.
$50.00 Cash, Helen Benesch, Junkins, Alta.
$25.00 Cash, Florence Nesbitt, Arnprior, Ont.

We will send you names of many others, too. Only boys and girls under 17 years of age may send answers, and each boy or girl will be required to perform a small service for us for which an additional valuable reward or special cash prize will be given. The contest will close on March 31st at 5.30 p.m.

Send your answer this very evening. Address:



You will be the Envy of all your Friends with this Car

Helping Nature,—the Key to Good Health

Watch for these Symptoms

Kidney or Bladder affections don't develop seriously until Nature has given you plenty of warning that the trouble has commenced.

Constant headaches, dizziness, pains in the back or sides, swollen joints and ankles, brick dust deposits, or painful urination should make you realize positively and beyond doubt that your kidneys are out of order and need assistance.

Nature is wise and never sends out unnecessary or foolish warnings. Her call is for help, and you must do your part by bringing relief to those overburdened kidneys, or suffer the consequences.

Rheumatism, Lumbago, Sciatica, Gravel, Stone in the Bladder, Neuralgia, etc., are all caused by inflamed or congested kidneys and the consequent deranged kidney action. Don't suffer the agonies produced by these diseases. Help Nature to relieve the congestion—to heal those inflamed kidneys and to make them strong once more—by taking Gin Pills.

Gin Pills are the best remedy for Kidney and Bladder troubles on the market to-day. This is a fact proven by hundreds of testimonials. Try them and be sure of instant relief. For sale everywhere at 50c a box. A sample box free if you write to—

The National Drug & Chemical Co. of Canada, Limited, Toronto, Ontario. U. S. residents should address Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y. 173

quartine. You have no right to send your child to school with a cold. It may be a beginning grippe and that child can infect scores of children during teh day. If your child develops la gripe, or a condition which is even suspicious of la grippe, that child should be placed in a room by himself and should be put to bed and your physician promptly sent for. You may have other household duties to attend to and it may be impossible for you to get help to wait on that child. If that is the case, when you go into the room you should slip over your dress an apron which completely covers it. You should make a mask of four to five layers of gauze and fasten it over your nose and mouth; this you must do because when bending over the bed your child may accidentiy sneeze or cough directly into your face and you may then become the victim of la grippe. When the germ has lodged in your nose or throat, you become a carrier of this infection to the other members of the family. It is a simple matter to slip off the apron you have worn over your dress and to remove the mask you have to protect your nose and mouth, when you leave the room.

One child quarantined properly in the very beginning will almost always save the other members of the family from an attack, but one child not quarantined with la grippe will mean that the disease wil be communicated to every member of the family.

There are several reasons, besides the mere fact of protecting the other members of your family, why you should quarantine your child and put it absolutely at rest in bed. In la grippe, and also in simple colds, complications are common and it is the complications which render la grippe so dangerous to human life. Perhaps the most common of these complications is pneumonia, and it is certainly the most dangerous. A grippe infection, when it has once gained its entrance into the nose and throat, can easily travel down the bronchial tubes to the lungs and a gripe-pneumonia is a most dangerous and fatal form of pneumonia, especially in childhood. A child that is put to bed promptly and is given corect treatment from the beginning stands a far greater chance of escaping any serious complication.

Your natural question, "What am I to do until my physician arrives?" Unfortunately many of you in times of war are being deprived of the advice of a physician, especially the physician who has been your counsellor for years. The first thing to do, as soon as the early symptoms begin, is to give the child a hot bath and a hot mustard foot bath. As soon as this is given, put the child to bed, warmly covered in a warm room that is well ventilated. Remember these points, they are all important.

A light diet should be given at all times. Older children should not be given any solid food and the nursing baby should only be aollwed to nurse about one-half the usual time. Empty the bowels at once. I mention this point because sometimes in la grippe the symptoms are principally referred to the stomach and bowels. Instead of severe congestion in the head, there will ofttimes be pain the stomach with vomiting and diarrhoea. This is because the infection has gotten down into the stomach and bowels. A good dose of castor oil in the beginning is essential whether the grippe be the type which is confined to the nose, thrat and chest, or whether in the stomach and intestines.

Many different drugs have been used and all of them with varying success. Whether the attack starts as a simple cold or whether it develops within a few hours to a case of la grippe, I believe the best preparation to use (and it should always be used under your physiciain's direction) is a combination of camphor, belladonna and Dovers powder, the dose varying, of course, with the age of the child. In an acute cold this combination works beautifuly and in a beginning attack of la grippe it ofttimes will block the attack within the first few hours. This combination can be given in tiny doses in powders to your babies. To older children, it can be given in larger doses, also prepared in powders, and dissolved in a little milk or peach juice.

One of the distressing symptoms is the discharge from the nostrils. This, as I have mentioned, often obstructs the breathing and makes nursing difficult, and makes it necessary for the child to breathe constantly through the mouth. I have found that if about one grain of menthol be dissolved in one ounce of liquid alobin and two or three drops of this be instilled into each nostril with a medicine dropper every hour, it will greatly relieve the congestion of the nose and make the breathing of the child easier. In older children, it is not necessary to use the medicine dropper. You can use the same combination in a spray and spray both nostrils thoroughly and frequently.

Croup

It is important that, in conjunction with the subject of colds and la grippe we should mention spasmodic croup.

Croup, while it may appear to be very alarming, is not dangerous. It is almost always the result of exposure to cold, but may be due to indigestion or some iritation in the throat. It is for this reason that croup often develops in conjunction with cold in the head. It is a strange fact that some children seem especially liable to repeated attacks, while other children can suffer from repeated colds without any symptoms of croup. Croup usually begins with a hoarseness, especially late in the afternoon or, as evening comes on, there develops a peculiar sharp, racking, metallic cough. Frequently, you will find the child will go to sleep and sleep soundly for three or four hours after being put to bed and then suddenly awaken and sit upright in bed grasping at anything it can reach and appear to be unable to get its breath. The cough then becomes very loud and the breathing hard. If the little one attemps to speak, the voice is extremely hoarse. This may last for one-half to an hour, or even sometimes for several hours before the spasm seems to relax and the child drops to sleep. Unfortunately other attacks may recur for several nights in succession. The time in a child's life when croup is most liable to occur is around the third or fourth year and the attacks will decrease in frequency and usually disappear entirely by the sixth year.

The treatment of croup is one of prevention. A child subject to croup should be guarded with great care against exposure to draft, to high winds and to dampness. If the little one is subject to croupiness in the afternoon or evening, the mother should begin by administering some medicine. Perhaps the best thing to use until the physician arrives is a mixture made up of two and one-half teaspoonfuls of the syrup of ipecac, one-half teaspoonful of potassium bromid dissolved in two ounces of water. A child two years of age can take one teaspoonful of this mixture every hour for three or four doses. When the attack comes on in the night and the child is in a serious condition there are two things to do. One is to get the child to vomiting and the other is to place the child imediately in a hot bath. Many children, if they can be made to vomit, will be promptly relieved from the spasm. There are several household remedies you can use to cause vomiting and I will give you three or four of them here:

1.—A teaspoonful or more of syrup of ipecacuanha, repeated in fifteen minutes.

2.—A glas of warm water with as much common salt as it will dissolve.

3.—A half-teaspoonful of powdered alum stirred up in syrup or in molasses.

4.—A teaspoonful of mustard in a large quantity of warm water, if other emetics fail.

The other treatment of value is the inhalation of warm steam vapor. The easiest and most practical place for the child is in its crib, which should be covered with a sheet. An open umbrella may be substituted when a crib is not available. Under the umbrella, which rests upon the bed, lies the child, and covering all is a sheet pinned to the umbrella. If preferred, the open umbrella, draped as before, may be placed over the baby-carriage. Any means or apparatus is adequate which will furnish steam and conduct it to the inclosed space The Holt croup kettle, when obtainable, is always to be used. The steaming may be continued for hours. The sheet should be removed occasionally for a few moments, in order to allow a change of air. Usually a child may be kept under the tent from twenty minutes to one-half hour without such a change. The tent is seldom so close as to prevent all ventilation.

ROOT AND FODDER CROPS

The total yield of turnips and other roots is estimated at 120,767,900 bushels from 343,037 acres, an average per acre of 352 bushels, as compared with last year's total of 63,451,000 bushels from 218,233 acres, the average yield per acre being 290¾ bushels. Hay and clover give the record yield of 14,595,500 tons from 10,544,625 acres, an average yield of 1½ tons. The corresponding figures last year were 13,-684,700 tons from 8,225,034 acres, or 1¾ tons per acre. The previous record yield of hay and clover was 14,-527,000 tons in 1916. Teh average value per ton of hay and clover is $9.75 as against $10.33 per ton last year. Alfalfa shows a yield of 448,600 tons from 196,428 acres, or 2¼ tons per acre as compared with 262,400 tons from 109,825 acres, or 2½ tons per acre, last year. Of fodder corn the estimated yield is 4,203,150 tons from 502,069 acres, an average per acre of 8¼ tons.

The total are a under root and fodder crops, including potatoes, turnips, etc., hay and clover alfalfa and fodder corn amounts to 12,321,351 acres, as compared with 9,576,568 acres in 1917. In total value at local prices these crops amount for 1918 to $330,975,825, as compared with $268,310,300 in 1917.

OIL FOR LOUSY PIGS

Crude oil is coming into general use as a means for keeping hogs free from lice. Some put a gallon of oil on a water pool and allow the pigs to wallow in it, which they do with evident delight. The oil may be added every four weeks or so. It is not so good a plan to oil them in the winter as the oil gets cold, even when aplied by a sprayer. One of the commercial disinfectants that quickly dry up are the best for winter months.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

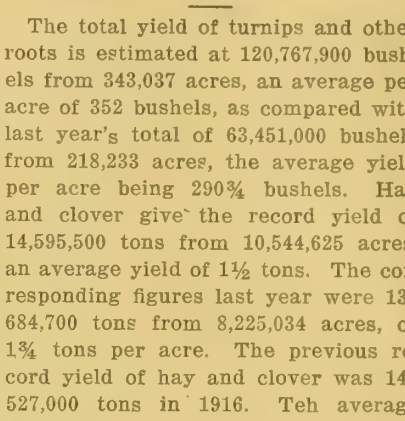
I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight aud dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309



Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

Laid Up For 2 Months

WITH PAINS IN BACK.

Pain in the back is one of the first signs showing that the kidneys are not in the condition they should be, and it should be gotten rid of immediately, if neglected, serious kidney troubles are likely to follow.

There is a way to "shake off" for ever the constant pain of backache, the annoyance of urinary troubles and all dangers of kidney ills. Go to your druggist or dealer; get a box of Doan's Kidney Pills; take a few doses, and see how quickly your backache will disappear.

Mr. Hugh Morton, Daysland, Alta., writes:—"I am glad to feel it my duty to let you know what great relief I found by using your Doan's Kidney Pills. I was laid up for two months with pains in my back and I found relief after having taken half a box of "Doan's." I cannot recommend them too highly to anyone having weak kidneys, as they have been a great help to me."

The phenomenal success of Doan's Kidney Pills in all parts of the world has brought forth many imitations. See that you get "Doan's" when you ask for them. Our trade mark "The Maple Leaf" is on every box. Price 50c. at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

BUTTERMILK RECIPES

These May Be Used When Sour Milk and Butter Are Scarce

The following recipes should all be made with buttermilk, though butter and sour milk may be used:

Brown Bread

Mix two cupfuls of buttermilk, half a culpful of molasses, half a teaspoonful of salt, one of soda, two cupfuls of cornmeal and a cupful each of Graham and wheat flour. Beat well, pour into a greased mold, cover closely and steam three hours. Sifted bran, finely ground oatmeal, buckwheat or rye flour may be substituted for the Graham flour wtih equally satisfactory results. Another change may be made by adding half a cupful of chopped dates, nuts or raisins.

If the bread is desired for sandwiches use one cupful of cornmeal, one of Graham flour or sifted bran, one of rye or buckwheat flour and one of wheat flour. Pour into well-greased baking powder cans, cover closely and steam one hour. This makes an excellent fine-grained bread that can be sliced just as thin as desired.

MINARD'S
"KING OF PAIN"
LINIMENT

I was cured of terrible lumbago by
Minard's Liniment
—Rev. Wm. Brown.

I was cured of a bad case of earache by
Minard's Liniment
—Mr. S. Kaulbach.

I was cured of sensitive lungs by
Minard's Liniment
—Mrs. S. Masters

Manufactured by the
Minard's Liniment
Yarmouth, N.S.

Graham Muffins

Beat well two cupfuls of buttermilk, one teaspoonful of soda, half a teaspoonful of salt, two tablespoonfuls of molasses, three cupfuls of Graham flour or one cupful and a half each of Graham and wheat flour; bake in a moderate oven.

Johnny Cake

Beat well two tablespoonfuls of sour cream, one cupful of buttermilk, half a cupful of sweet milk, a qutrter of a cupful of sugar, one egg, one cupful and a half of flour sifted with half a teaspoonful of salt and one teaspoonful each of cream of tartar and soda, and one cupful and a holf of corn meal. Bake in shallow tins. Buckwheat or Graham flour may be substituted for the corn meal if preferred.

Griddle Cakes

Beat well one pint of buttermilk, half a teaspoonful of salt, one teaspoonful of soda, and flour to make a thin batter. Bake a golden brown on a not-too-hot griddle. A mixture of of half buckwheat and half wheat flour makes especially delicious hotcakes. Serve with maple syrup.

Cookies

Mix one cupful of sour cream, half a cupful of buttermilk, one cupful of molasses, one heaping teaspoonful of soda, half a teaspoonful each of salt, ginger, cloves, cinnamon and extract of lemon, and flour enough to roll. Cut in any desired shape, press a raisin or a square of citron into the center of each and bake in a moderate oven. When cold, ice with an icing made of two tablespoonfuls of thin, sweet cream and powdered sugar enough to thicken. This recipe is especially good for making animal or dool cookies for children.

Waffles

Mix one cupful of sour cream, one cupful of buttermilk, two scanty cupfuls of flour sifted with one small teaspoonful of soda and a pinch of salt, three well-beaten eggs. Beat well and bake as usual.

Crullers

Mix quickly, with just enough to roll, half a cupful of sour cream, one cupful each of sugar and buttermilk, one egg, half a teaspoonful of salt, one of soda and one of nutmeg or cinnamon. Cut in any desired shape and fry in deep fat.

Doughnuts

Mix a third of a cupful of sour cream, one cupful of sugar, one egg, one cupful of buttermilk, one teaspoonful and a half of cream of tartar, one teaspoonful and a quarter of soda, half a teasponful of salt, one teaspoonful of nutmeg or cinnamon or half a teaspoonful of each, as preferred, flour enough to roll. Fry in deep fat and drain on brown paper.

Gingerbread

Beat well half a cupful of sour cream, one cupful of buttermilk, one cupful of sugar, one cupful of molasses, two cupfuls and a half of flour sifted with half a teaspoonful of salt and one teaspoonful each of ginger, cinnamon, cloves and all spice, two eggs. Bake in a quick oven.

Caraway Cookies

Mix one cupful of sour cream, half a cupful of buttermilk, two eggs, half a teaspoonful of salt, one teaspoonful of soda, caraway seeds to taste and flour enough to roll. Currants may be substituted for the caraway seeds or the cookies may be dredged with cocanut.

FREE PRIZE PUZZLE $4500.00

In Cash has been Given Away FREE also hundreds of Merchandise Prizes

$2000.00 more IN CASH will be Given Away as follows

1st Prize, $50.00 in Cash. 2nd Prize, $40.00 in Cash
3rd Prize, $35.00 in Cash. 4th Prize, $25.00 in Cash
5th to 9th Prizes—Each **$10.00** in Cash.

TOGETHER WITH MANY MERCHANDISE PRIZES

Herewith will be found the picture of an Aviator who has just dropped a bomb on a pile of Shells. At first glance the Airoplane and the Explosion appear to be all there is in the picture, but by careful study the faces of several soldiers will be found. There are 7 of them in all. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Four Thousand Five Hundred Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Upon receipt of your reply we will send a complete list of the names and addresses of persons who have won $4,500.00 in Cash Prizes in recent contests held by the publishers of this advertisement. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, as all previous winners of cash prizes are debarred from entering this contest.

Send Your Reply Direct to
GOOD HOPE MANUFACTURING COMPANY
46 ST. ALEXANDER STREET, MONTREAL, CAN.

Date Gems

To one pint of Graham flour and one pnit of white flour add half a teaspoonful of salt, one level teaspoonful of soda, a quarter of a cupful of sugar, one cupful of dates—stoned and cut in smal pieces—and lastly enough rich buttermilk to make a stiff batter. Drop in hot, well greased gem pans, half filling each, and bake in a quick oven until a golden brown. Raisins may be substituted for dates and instead of making a stiff batter less buttermilk may be used, the dough quickly turned out on a board, rolled half an inch thick, cut into biscuits, and baked in a quick oven.

Cake Frosting

Put three-fourths of a cupful of buttermilk into a graniteware saucepan and add three-fourths of a cupful of sugar. Bring the mixture to the boiling point and let it boil until it forms a soft ball when tried in cold water. Remove from the range and beat until it becomes thick and is of the right consistency to spread.

LET THE CHILD CHOOSE

Don't make me do it, mamma, let me do it," pleaded a little fellow one day when his mother was trying to exercise rather arbitrary authority.

A smal lboy was objecting to doing an errand for his mother. She said pleasantly, "I can manage if you do not do it, but I can get my work out of the way much sooner, if you do. Supposing I let you choose whether you will acocmodate me, or I accomodate you. I'll say nothing more about this, and you may do just what you think it is fair for a boy to do by his mother." It did not take long for the son to choose the better way and to walk off proud of his independent action.

Coaxing a child to do what he ought to is a questionable policy. yet in a dignified, matter-of-fact manner to show him that you give him credit for common sense and a fair amount of amiability and right purpose is to encourage him to use those qualities. It ihelps him to do his best in the best possible way—he chooses his own action, and can choose again.

LABELLED GOODS

"Made in Canada" will without doubt soon become a slogan and purchasing guide throughout this country.

The maker's name or trade mark on all goods has, for years, been the customer's greatest protection against deception, short weight or poor quality.

Many have been too careless or indifferent, in the past, to look for the name on label, sealed carton, stamp or plate, or whatever may have been used to indicate the origination and the responsibility of manufacture and sale of goods they purchased.

Many others thoughtlessly supposed that they got greater value for their money when they bought from bulk or securing what looked like a bargain but which did not bear the name of a reputable manufacturer.

But from now on there will be a patriotic reason for knowing the source of any article we buy in the retail stores.

Bulk goods may or may not be "Made in Canada," unless such goods are put up in packages and properly labelled we will not be satisfied.

It will be a good thing because it will make us more careful. It will make the manufacturer and the dealer careful too, and we will get more and better goods for the money.

As different brands become better known to us we will learn how to discriminate.

All manufacturers and producers should be urged to label their goods in some unmistakable way so as to protect the interests of Canadian products against the advance in our midst of any German product with its origination cleverly concealed or merely lacking any evidence of German identification. Labelled or declared goods will be in demand as never before. The unnamed or unidentified goods will be looked on with suspicion and classed as doubtful.

TO SEW BUTTONS ON COATS AND CLOAKS

"Although it is necessary to sew the buttons very securely on coats and cloaks, there must be no marks or stitches on the under side of fronts or collar to even suggest the location of the buttons except in a few cases where a small button is used on the under side as a stay," says Chalrotte E. Carpenter, of the Colorado Agricultural College.

"Tie a small knot in the end of strong, double waxed thread. Take a small stitch through the upper thickness of the garment at the point marked for the position of the button; take a second stitch through the shank of the button or put the needle up and down through the holes. In the latter case a pin should always be laid across the button and under the thread shank. Repeat six or eight times, keeping the same tension and alternately taking a stitch in the material and then carrying the thread through the shank or holes of the button. While sewing, the button should be tipped a little to one side so the needle can be brought out from the under side of the button before it is carried through the material. If the button has holes, the pin is removed and the working thread wrapped four times around the other threads and then fastened by taking three or four back stitches on the right of the garment close to the thread shank.

"When using the small button on the under side, begin in the same way but each time put the needle up or down through the garment and the upper and under buttons. The under button should have the same number of holes as the upper one and the holes should be large. A pin should be laid across the upper button and the thread shank and the fastening should be made in the way described above."

"Whatever is the Matter, Jack, You Don't Look Well!"

"OH, I'm all right."

"But you're not. You look so worried and tired."

"Well, I haven't been sleeping very well lately."

"No, and you don't seem to have any appetite. I think you ought to take something to tone up your system."

"Oh, no, I don't need any medicine. I guess I will soon be all right."

"But you should not neglect yourself, for that is just the way I was before I had nervous prostration, and you know what a long time I was laid up."

"Well, I haven't any time to be laid up, that's a sure thing."

"I know what I am going to do. I am going to buy half a dozen boxes of Dr. Chase's Nerve Food and see that you take it regularly."

"You know, Jack, that nothing seemed to help me like Dr. Chase's Nerve Food, and I am sure it will be just as good for you."

"You will take it, won't you?"

"I'll do most anything to get feeling better, for I know I have been losing my grip on business lately."

"I get up feeling tired in the mornings, and have to drive myself to do the work that used to be a pleasure for me. I have got in the way of putting off matters that need attention, and hate to meet people when I know that some energy will be required to discuss business deals with them."

"You'll take the Nerve Food, won't you?"

"Oh, I'll let you be the doctor, and if the Nerve Food builds me up like it did you I'll soon get back my old-time vigor and be able to make things hum. I have been rather discouraged lately, but I can see now that the trouble is in the condition of my nervous system. So you get the Nerve Food and we'll see what it will do."

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Limited, Toronto. Every box of the genuine bears the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author.

TO IMPROVE CABBAGE SALAD

I have dscovered that a cup of chopped celery, or, if celery is out of season, a liberal sprinkling of celery salt will greatly improve any cabbage salad or cold slaw.

KEEPING SNAPS SNAPPED

One usually has a partly used card of snap fasteners in her sewing basket; so when taking snaps from an old garment, instead of throwing them into a box to be lost or mismated, let her fasten them upon this card with the unused ones.

TO PREVENT EYEGLASSES FROM STEAMING

Eyeglasses may be kept from steaming by rubbing the lens with vaseline, then polish them with a silk handkerchief or a bit of chamois.

There is no waste so irretrievable as that of a nation which is careless of its rising generation. And the goal is not an industrial machine, a technical workman, a 'hand,' available merely for the increase of material output and the acquisition of a wage at the earliest moment, but a human personality, well grown and ready in body and mind, able to work, able to play, a good ctzen and ahealthy parent of a future generaton."

If your child has a room to himself he will take pride in making it beautiful—that is, if you give him full liberty to decorate it as he thinks best. The tastes of children differ widely. You cannot make a boy or an out-of-door, athletic girl love and cherish a dainty pink-and-white room. On the other hand, the room of boyish crudenes and simplicity will chill the heart of a girl whose tastes run to frills and fine needle work.

MARKETS.

CHARLOTTETOWN

MARKET REPORT

Jany 28, 1919.

Beef, Carcass, cow, 13c to 15c per lb.; Ox, 14c to 16½c.

Beef, Retail, cow, 20c to 22c per lb.; Ox, 22c to 24c lb.

Veal, None.

Hogs, dressed select, 19½c; Heavy, 14½c.

Lamb, carcass, 22c to 24c.

Mutton, carcass, 16c to 18c.

Beef Hides, 15c lb.

Sheep Skins, $3.00 to $3.50 each.

Calf Skins, 30c lb.

Potatoes, 50c to 60c per bushel.

Carrots, $1.25 to $1.50 per 100 lbs.

Turnips, 20c to 25c per bushel.

Parsnips, $2.00 to $2.50 per 100 lbs.

Oats, 70c to 75c per bushel, market week.

Cornmeal, $3.95 to $4.25 per bag.

Bran, $2.20 to $2.25 per bag.

Oatmeal, $6.00 to $6.25 per bag.

Middlings, $2.50 to $2.60 per bag.

Oil Cake, $3.75 to $4.00 per bag.

Ontario Flour, $12.00 to $12.50,—Woods.

Manitoba Flour, $12.50 to $12.75—Woods.

Chickens, 28c to 32c per lb.

Fowl, 18c to 24c per lb.

Turkeys, None.

Geese, None.

Butter, Creamery, 50c to 53c per lb.

Butter, Dairy, 40c to 45c per lb.

Cheese, 25c to 27½c, per lb.

Hay, loose, 95c to $1.00 per 100 lbs.

Hay, Pressed, $18.00 to $20.00 per ton.

Straw, loose, 50c to 65c per 100 lbs.

Straw, Pressed, $12.50 to $14.00 per ton.

Eggs, 52c to 55c per dozen.

MONTREAL

Dairy Produce Trade

Montreal, Feby 1st.

The receipts of butter today were 461 packaes as compared with 522 for the same day last week, and 37 for the corresponding date a year ago. There were no new developments in the concition of the market today, prices being firmly maintained with a steady demand for supplies, and a fair amount of business continues to be done in a wholesale and a jobbing way. The demand for oleomargarine has improved of late, and the movement has been larger in a jobbing way at 33c to 34c per lb.

We quote wholesale jobbing prices as follows:

Finest creamery.....53c to 54c
Fine ceramery.....52c to 52½
Finest dairy.....45c to 46c
Fine dairy.....41c to 43c

The receipts of cheese today were 11 boxes, as against 153 for the same day last week, and 113 for the corresponding date a year ago. Owing to the very small supplies coming forward from the country and the light stocks held on spot, the volume of business in all directions is small and the market is quiet with a firm undertone.

The following prices are being paid by the Commission:

No. 1 cheese.....25c
No. 2 cheese.....24½c
No. 3 cheese.....24c

New York, January 29.—Butter, weak. Receipts, 8,770 tubs. Creamery, higher than extras, 47½ to 48c; creamery, extras, 92 score, 46½c to 47c; firsts, 44c to 46c; packing stock, current make, No. 2, 34c. Cheese, irregular. Receipts, 1,267. State, whole milk, flats, current make, special, 34½c to 35c; do. average run, 34c.

EGG PRODUCTION INCREASING

Montreal, Feby. 1.—The mild weather is beginning to have a material effect on production. Receipts at consuming centres have shown a marked increase, and dealers have found it necessary to reduce their jobbing prices to keep their floors clean. About the middle of the week the price of specials at Toronto dropped to 65c and by Saturday 65c was the most general quotation for this grade. On the Toronto farmers' market the retail price was 70c. Ontario country shippers report having paid during the week 53c to 55c for straight gathred eggs and made sales on a basis of 58c to 59c f.o.b. cases returnable. For this week country shippers say they are only offering 50c, one shipper said that the best price he had been offered so far for this week's shipments is 54c f.o.b. Storage eggs are about at an end for this season. Those dealers who still have some are asking from 53c to 55c candled.

In the Western Provinces production is increasing, but not yet sufficient to fill local requirements. Calgary is the first point to make large importations of States eggs this year, one car from Washington being received last week with another due yesterday (Monday). These eggs are jobbing at twenty dollars per case. The shipment of three thousands cases Chinese shell eggs scheduled to arrive by the Monteagle did not materialize. So far British Columbia importations of States eggs are only in small quantities.

The United States markets developed some weakness during the week, due to increasing receipts and moderate demand. Chicago dropped to 54c to 55c for firsts and today showed a further decline to 53c. The difference between the price of storage and fresh is so close now that most of the trade are taking fresh and the tone of the storage market is easier in sympathy. There are very few storage left, however, to be any factor of consequence.

The future for the next few weeks is full of uncertainty, prices may soon reach a point where increasing consumption will overtake receipts, in which case a temporary advance in prices will occur, but this can only be temporary and a gradual setting of values can be looked for. The situation is too uncertain to hazard an opinion as to the immediate future, careful traders are keeping their floors cleaned up daily.

There was no important change in the condition of the local egg situation today, but the undertone to the market is easy, and the prospects are for lower prices in the near future if supplies for new laid stock continue to come forward freely. The demand is steady for small lots, and a fair trade was done in a jobbing way. The receipts today were 265 cases, as compared with 231 for the same day last week, and 118 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

THE PROVISION MARKET

Montreal, Feb. 1.—A weaker feeling has developed in the Canadian live hog situation since Monday, which resulted in a decline in prices in the Toronto market of 50c per 100 lbs. with sales at $16 to $16.50 per 100 lbs. fed aind watered, and in the Winnipeg market selected lots are 25c per 100 lbs. lower at $15.25 per 100 lbs. weighed off cars In sympathy with the above the Montreal market was weaker today and trade was very quiet on account of the limited supplies coming forward, anad the few small lots of selected stock offered at $16..50 per 100 lbs. weighed off cars There was no change in prices for dressed hogs, but the undertone to the market was easy. The demand was principally for small lots to meet immediate wants with supplies ample and sales of country dressed light adn medium weights wer made at $20 to $22, and heavy weights at $18 while city dressed abattoir fresh-killed hogs were quoted at $23 per 100 lbs. At the meeting held at Washington on Tuesday, of the United States hog committee at the Food Administration office, it was unanimously agreed that $17.50 per 100 lbs. would be the price for live hogs for the month of February which figure has been maintained since last November

THE CATTLE MARKET

Montreal, Feb. 1.—At the Canadian Pacific Live Stock Market, the offerings today amounted to 300 cattle, 250 sheep and lambs, 200 hogs and 100 calves. Owing to the further weakness in prices for lambs and another decline in prices at $1 to $1.50 per 100 lbs., a feature of the trade at this market has been the demand from American buyers for suplies, and shipments so far of 5 cars were made to New York ,and in adition tothis 3 cars of cattle were shipped to Jersey City

FARMERS

MAKE your banker your financial adviser. Let him help you to shape your affairs so that he will be warranted in giving you ample credit to operate your farm efficiently. Our aim is to assist you in every way possible.

THE CANADIAN BANK OF COMMERCE

2A

Ingersoll Reliance

A Master Seven Jewel Watch

AS a watch investment, the Ingersoll Reliance stands alone. It is the best 7 jewel watch you can buy at the price.

As a symbol of personal taste, the Ingersoll Reliance bespeaks refinement. Its slim, graceful case, its beautifully designed dial and its artistry of finish satisfy the most critical taste.

As a time-piece the Ingersoll Reliance is the master product of the world's greatest organization of watch makers. It is a close timer, sturdy of movement and capable of a life-time of reliable service.

The sturdy Bridge Construction, the Safety Barrel enclosing the Spring, and 20 other distinct and recent improvements—most of them found in no similar time-piece—make this the Master 7 Jewel Watch.

In solid Nickel case the Ingersoll Reliance sells for $6. In gold-filled case the Reliance sells for $9. At good dealers everywhere.

ROBT. H. INGERSOLL & BRO.
128 BLEURY STREET . . . MONTREAL

The market today for al lines of live stock was dull and weak, notwithstanding the very small supplies available as compared with the latter months of last year, but as the large buyers the well stocked up with most lines, the demand is limited and only for odd lots from the small butchers and trade in consequence is slow. There were some very choice steers on the market yesterday, which cost $11.50 per 100 lbs. in Toronto, but as the best bid obtainable here for them was $12, holders refused to sell at such a hevay loss. Sales of odd small lots of steers were made at prices ranging from $7 to $10 ,cows at from $6 to $9, and bulls at from $6 to $9, while canning bulls sold at $5.50 to $6, and cows at $4.50 to $5.5.0 per 100 lbs.

The feature of the trade in small meats was the weakness in the market for sheep and lambs and prices scored a further decline at $1.00 to $1.50 per 100 lbs. At this reduction there was a steady demand from American buyers for lambs and sales of Ontario stock were made at $12.50 to $13 and Quebec at $11.50 to $12, while sheep sold at from $6 to $8 per 100 lbs. as to quality. A steady feeling prevailed in the market for calves and prices were unchanged, with a fair demand for small lots, and sales of milk-fed stock were made at from $10 to $16 per 100 lbs. as to quality and size. The trade in hogs was slow and prices were weaker, with sales of selected lots at $16.50 per 100 lbs. weighed off cars.

EUROPEAN CROP PROSPECTS

Bromhall vabled respecting prospects:

Foreign conditions as compiled from latest information available:

United Kingdom—There are many complaints that the crop is suffering from recent heavy precipitation. It is also reported that farm work is getting backward, owing to the unfavorable weather.

France—This country has also had too much rain, and there are fears that crops will begin to suffer from the wetness. Agricultural preparations have been retarded to some extent.

Italy—Owing to the scarcity of labor and fertilizers, abriculture has been hindered. It is reported that the acreage to the new wheat crop is short. Severe floods in the north and centre have damaged the new seedings.

Spain—Latest reports speak optimistically concerning the outlook for the new seedlings. The supply situation remains favorable, and the bright prospects for the new crop are maintained.

THE BALED HAY MARKET

Montreal, Feb. 1.—A fair volume of business continues to be done in baled hay and, as supplies are none too large to meet the requirements, the tone of the market remains firm with sales of car lots of N. 1 Timothy hay at $23 to $24, No. 1 light clover mixed hay at $22 to $23, No. 2 timothy hay at $22 to $23, No. 2 clover mixed hay at $21 to $22, and No. 3 timothy hay at $20 to $21 per ton, ex track.

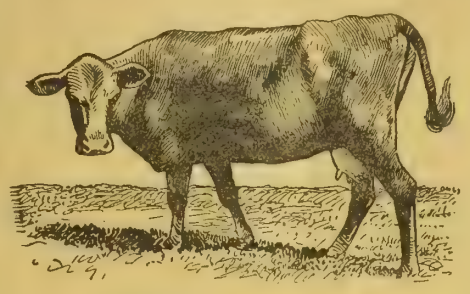
TWELVE CARS HAY

The Maritime Farmer can offer from ten to twelve cars of good hay on track in Carleton county. Agricultural Societies requiring hay should write Societies requiring hay should write. The price is right but the lot will be sold to first who enquire. Purchasers must furnish bank guarantee for amount. Cars average thirteen tons.

A stable should be ventilated for three reasons: First, to regulate temperatures; secondly, to remove moisture and foul air; thirdly, to provide fresh air.

"Scrub" Feeding is as Bad as "Scrub" Breeding

A poorly fed cow that gives less than, or only enough, milk to pay for her keep requires just as much attention, just as much feed for upkeep and must be milked just as often as a good cow. Scrub feeding does not pay.



By feeding your cows a ration containing the proper amount of proteins, with a proper balance between constipating and laxative ingredients, together with sufficient bulk for proper digestion, you are bound to get larger yields of milk.

Your feed problem is solved quickly and satisfactorily by using

Monarch Dairy Feed

It is mixed in the proper ratio to produce the largest yields of milk. It keeps the cows in good healthy condition. Monarch Dairy Feed is highly digestible and is composed of oil cake meal, cotton seed meal, bran, corn feed and barley feed—an ideal ration for high milk production.

Monarch Dairy Feed, while being very rich, may be safely fed alone. The guaranteed analysis is: Protein 20%, Fat 4%.

Give Monarch Dairy Feed a trial. It solves one of the important points in successful dairying. Give your dealer's name and we will send you booklet, "Getting the Most Out of Dairying."

Monarch Hog Feed

A special Feed that meets all the requirements of the breod sow and the growing pig; consists principally of corn meal feed, shorts and digester tankage. Guaranteed analysis: Protein 15 per cent., Fat 4 per cent.

Sampson Feed

Meets the demand for a general purpose feed both for cattle and hogs. It is sold at a somewhat lower price than either Monarch Dairy Feed or Monarch Hog Feed. Guaranteed analysis: Protein 10 per cent., Fat 4 per cent.

The Campbell Flour Mills Co., Ltd., Toronto, Peterboro, Pickering

Canada Food Board Licenses Nos. 6, 7 and 8. 53

FEEDING CATTLE IN NOVA SCOTIA

(Continued from page 542)

Department of Agriculture is offering similar assistance to anyone in Canada.

Cotton seed meal appears on our markets in several different grades. The highest grade contains at least 41% of protein and is sweet in odor and bright yellow in color. The next grade contains about 38% of protein, and the next 36%. These three are all excellent feeds when clean and sound in color and odor.

Among the low protein feeds dried beet pulp should be especially mentioned. It is not high in protein or fat but is especially rich in digestible carbohydrates and is valuable at this time on account of the high price of corn meal. In addition to its nutrient content it is succulent and palatable and furnishes a welcome addition to the dry feed generally obtainable for winter rations. It is best used by soaking with just enough water to moisten it thoroughly and cause it to swell, but leaving it dry enough to handle easily. It should be dampened twelve hours before the time of feeding.

It was stated in the beginning of this circular that the manufacturer is compelled by law to give the maximum percentage of fibre that may be contained in his feeds. This is because a high percentage of fibre is likely to reduce digestibility. For instance, oat hulls are low in digestibility because of their hard, fibrous nature. On account of the enormous quantity of oats that are manufactured into breakfast foods great quantities of hulls accumulate at the factories. These when mixed with heavy feeds lighten them and add to their bulk, but do not add much to their feeding value. For such reasons as this the manufacturer is compelled to give the maximum percent of fibre in the mixed feeds he sells, and thus when the buyer sees a high fibre content (say over 20%) in the analysis of a feed he may know that products of rather low digestibility have been used up in its make-up. This has a special bearing on the selection of feed for pigs, as they need feeds low in fibre. Their digestive tract is not so constructed as to enable them to digest easily large amounts of fibre. This is especially true of young or fattening pigs. Brood sows may often be fed some coarse feeds to advantage. Generally speaking pigs need middlings and feeding flour instead of bran, and corn or barley instead of oats. They need to be supplied with more concentrated high priced feeds than any other class of farm stock.

The digestibility of feeds is an important factor to be considered in making up a ration. Unfortunately it is impossible to determine quickly the comparative digestibility of the proprietary feeds on the market. The guaranteed analysis given for all these feeds is always the total amount of each constituent which they contain. For instance the average protein content of wheat bran is 16%. Some of that is indigestible however, and the animal is able to use only 78% of the 16% present. This reduces the digestible protein in bran to 12.5%. The same thing is true to a greater or less extent of all constituents in all feeds. When therefoer the manufacturer gives us the total analysis of his feeds we are not sure just how valuable hey are as we do not know what per cent of the nutrients they contain are digestible. When buying feeds we are compelled to take the total analysis as all feeds are sold in that way. When making up a ration, however, we use tables that give the percent of digestible nutrients in the feeds. We really therefore have one standard for buying and another for feeding. The total analysis given by the manufacturers is fairly safe as a basis of comparison between feeds, and therefore hlps us out in buying. It does not give us the number of pounds of digestible nutrients that we can get from each feed however, and therefore in making up the rations in this circular I have used the digestible nutrients in each case. This resutls in a slightly larger number of pounds of each feed being used than would be the case if the amount given in the total analysis was all available to the animal.

HINTS FOR MOTORISTS

by ALBERT L. CLOUGH, Editor Motor Service Bureau Review of Reviews...

Copyright 1919, by The International Syndicate.

GIVING THE ENGINE "THE ONCE OVER"

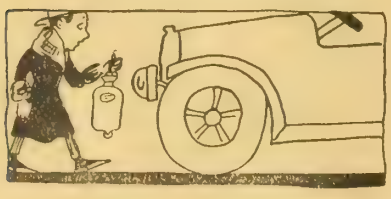
Occasional Inspection Insures Better Performance

In many parts of the country there are periods during the winter when the snow is so deep that the use of a motor car is practically impossible. Such a period furnishes an excellent opportunity to do repair and maintenance work without incurring unnecessary loss of use of a car and the following suggestions relate to inspecting and caring for an engine which may not have received attention for sometime: If carbon accumulations have not been recently removed it is well to give each cylinder a dose of the best carbon remover obtainable, following the directions explicily and allowing plenty of time for the liquid to do its work. This treatment will not only loosen the incrustations, but will tend to free the piston rings, if they are gummed in their grooves. Even if an engine has a detachable cylinder head, remoping it and replacing it, in order to do a scraping job, easy as it sounds, involves considerable work and if an application of decarbonizer will clean the cylinders sufficiently to ward off the "carbon knock" even for a time, it is worth while making, as it can do no harm and takes hardly any time. If a somewhat more thorough job is desired, the cylinders can be burned out with oxygen, without any dis-assembling being required. The next piece of work should be to test the compression and before it is performed, the engine should be run idle for some time in order to restore the "oil seal" at the piston rings. To test the cylinders for gas-tightness the spark-plugs should be removed from all but one of them, say number one. The engine should then be hand cranked and, when both valves of this cylinder have closed, their should be a strong, sustained, springy resistance to further motion of the crank. If this resistance against cranking effort maintains itself indefintely for a reasonable length of time, the sylinder is satisfactorily tight, its valves do not require grinding and the rings and other fittings are reasonably tight. Take out the spark-plug and put it into cyiinder number two, making the same test. If the resistance to cranking is low and but momentary, and you hear the hiss of escaping gas, it may indicate that the valves require grinding, that the rings require renewal or that the head gasket, valve caps or spark-plugs leak in which cases the appropriate remedies should be applied. All cylinders should be tested in the same way. Nothing tends more toward smooth and powerful running than equally perfect compression in all cylinders.

Loose Bearings Advertise Themselves By Noise. Let The Quiet Ones Alone

The next thing to be done should be the drawing off of the oil (unless this has recently been performed), and the flushing out of the whole lubricating system with kerosene, with which the old oil has been temporarily replaced, the kerosene being circulated by turning over the engine for a fraction of a minute by hand or by the starter; the drawing off of the kerosene and the substitution of fresh cylinder oil. Cleaning the oil strainer should not be neglected. With the engine running, rubber water connections should be inspected for leakage and, if they cannot be made tight by screwing up on their clamps, new ones should be put in. If water escapes along the pump shaft and this cannot be stopped by tightening its stuffing boxes, new packing should be provided. The valve gear should be looked over and if there is more than the required clearance between any valve-stem and its push-rod or rocker-arm or indeed any excessive lost motion anywhere in the mechanism, this should be taken up by adjustment in the interest of quiet operation and full power production. The spark-plugs should all be removed and their spark-gaps adjusted to the distance recommended as best for the ignition system used. A gauge for this purpose is usually furnished by the makers of the electrical apparatus. Unless the engine ha slacked smoothness of operation, knocks, taps or pounds having, at times, been audible, when it was running, it is of no advantage to do anythng to any of the bearings. Indeed it is of no advantage even to inspect them, for a bearing which is loose enough to demand attention is sure to give notice of this fact by unusual operative sounds. Much harm has been done and lots of money has been wasted by having bearings adjusted "on suspicion," when they did not need it. For example, many bearings have been disturbed for adjustment, when the knock that had been experienced was really due to carbon preignition. quiet engine bearings should be let alone and tight valves should not be ground just for the sake of "doing something."

METHODS OF PRE-HEATING INTAKE SYSTEM



A. J. P. asks: Is there any better way of heating the carburetor and intake pipe, when starting the engine cold, than pouring hot water over them? I do not like to do this, because the spilled water freezes upon the floor in severe weather.

Answer: We think there is to be had a heater, adapted to fit around the intake pipe in which heat is produced by the flameless combustion of a chemically treated pasteboard element, similar to that used in some portable vulcanizers. This should be fairly effective. There are also the electric heaters, shaped to encircle the mixture pipe, but these are generally wound for battery current and we suspect that your car carries no storage battery. Such heaters, wound for garage lighting current, ought to be obtainable. Heating the intake system by the flame of an ordinary gasoline torch is a very effective method and, while it cannot be recommended as a very safe one; if it is carefully done, with the gasoline valve shut and no oily matter within range of the flame, is not very risky.

SIMULTANEOUS SPARKS AT PLUG POINTS

S. B. asks: Do spark-plugs with several points or with large parallel sparking surfaces really pass a number of sparks at exactly the same instant?

Answer: We doubt it, but we cannot say that we know positively. A plug of this kind, when being demonstrated, always appears to be passing a number of simultaneous sparks, but this proves nothing as all discharges occurring within about one-twentieth of a second would seem to the eye to be simultaneous. In this length of time, however, an engine, running at 1,200 revolutions per minute, would complete an entire revolution. Our opinion is that the sparks seen under such circumstances are successive and not simultaneous and that, if the image of the discharge were viewed in a very rapidly rotating mirror, this would be proven to be the fact.

FOR MAPLE SYRUP AND SUGAR

Every maker of Maple goods in Eastern Canada should be interested in this remarkable contest. Our last competition before the war showed us how to arrange the prize money so that more competitors will be sure of being in the winning class. This Spring will offer an unprecedented opportunity in the development of the Maple industry and this contest will help to classify and arrange the various grades and qualities of Syrups and Sugars produced in Canada. Why not equip your grove and enter this contest, For full particulars, write to

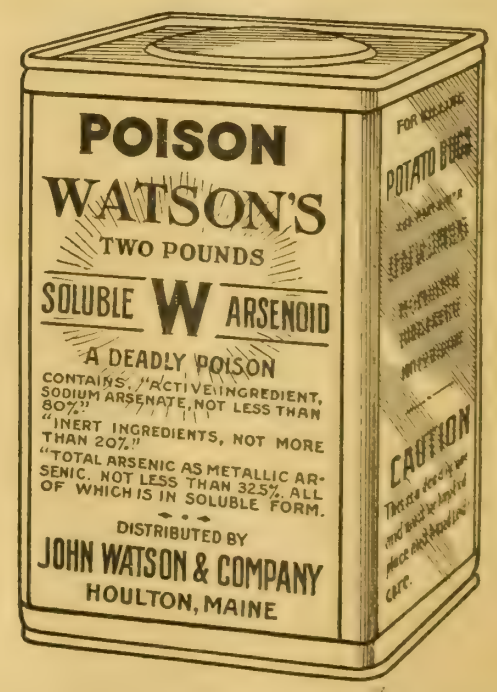
WATSON'S SOLUBLE ARSENOID



POISON
WATSON'S
TWO POUNDS
SOLUBLE W ARSENOID
A DEADLY POISON
CONTAINS: "ACTIVE INGREDIENT, SODIUM ARSENATE, NOT LESS THAN 80%"
"INERT INGREDIENTS, NOT MORE THAN 20%"
"TOTAL ARSENIC AS METALLIC ARSENIC. NOT LESS THAN 32.5% ALL OF WHICH IS IN SOLUBLE FORM."
DISTRIBUTED BY
JOHN WATSON & COMPANY
HOULTON, MAINE
FOR POTATO BUGS
CAUTION

One pound does the work of two of Paris Green, and does it better. It's first cost is far less than Paris Green. WATSON'S SOLUBLE ARSENOID is now recognized to be far the most efficient insecticide for killing potato bugs and other leaf eating insects.

It must be used with bordeaux mixture. and not otherwise. It is very adhesive and does not wash off easily.

FREE OF DUTY except the war tax.

On July 22, 1918, the Canadian Customs at Ottawa issued an order removing the duty on WATSON'S SOLUBLE ARSENOID except the war tax, and this order applies only to WATSON'S SOLUBLE ARSENOID, manufactured by John Watson and Company, Houlton, Maine. This endorsement speaks for itself.

WATSON'S SOLUBLE ARSENOID has been on the market for a number of years and is used almost exclusively in Aroostook County. If your dealer cannot supply you, write us direct, and give us the name of your dealer.

JOHN WATSON AND COMPANY,
HOULTON, MAINE, U. S. A.

ALCOHOL CONDENSERS

D. F. asks: Is there any device hich can be attached to a radiator to atch the alcohol which would otherise be lost when boiling occurs?

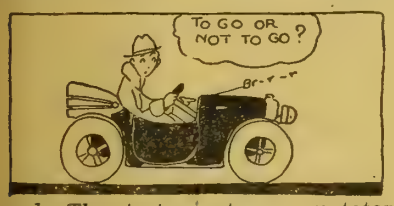
Answer: A small quantity of heavy l is sometimes put into the radiator, hich floats upon the alcohol solution nd somewhat retards its evaporation. short piece of thin walled rubber ibing can be slipped over the end of ie overflow pipe and closed with a inch-cock. If the filler cap is tight, nis causes a slight pressure in the adiator and reduces evaporation, but

he rubber tube blows off if the pressure becomes excessive. One well nown car carries a special tank, piped to the radiator overflow, in which lcohol vapor condenses and is later estored to the radiator. There was nd perhaps still is marketed, a device consisting of a coil of metal tubing, rranged around the filler cap, one nd of which is connected to the overlow and the other tapped into the top of the cap. The cold air is supposed o condense alcohol vapor in the coil. An extensible rubber container, simlar to a hot water bag has been used as a condensing tank, it being connected by rubber tubing to the radiator overflow.

ELECTRIC STARTER HAS LOST ITS "PEP"

H. A. S. asks: What causes an electric starter, which at first turned the engine over quite fast, to lose its ability to do this? My starter has got so that it cranks so slowly as to make starting quite uncertain.

Answer: Your battery may be out of condition and, while it may deliver current sufficient to light your lamps to full brilliancy, when called upon to furnish the comparatively large starting current, its voltage may drop too much to permit of a high cranking



speed. The starter motor commutator may be dirty or its brushes may make imperfect contact, the starting switch may make a poor connection or the cable contacts in the starting circuit may be imperfect. We assume that you are making due allowance for the enormously increased power required to turn over a cold motor, due to the stiffening of the oil on pistons and crank-shaft bearings. This will greatly reduce cranking speed. The same effect is produced when bearings have been tightened or new rings fitted.

Questions of general interest to motorists wil lbe answered in this column, space permitting. Address Albert L. Clough, care of Mairitme Farmer, Sussex, N. B.

LIMESTONE AND SLAG AS A FACTOR IN CLOVER GROWING

(Continued from page 532)

Water soaked soils are usually more acid than sandy areas. However, as pointed out above, dry sandy areas are often so acid that they will not produce clover without lime. That water soaked areas may be made to produce clover by aplying lime is well illustrated by the following test of two plots treated alike in every respect, except that two tons of limestone were applied to one plot and none to the other. This area was so wet that when seeded to grain in 1917 the grain crop failed to produce much, yielding only a small crop. The crop produced was as follows:—

	1917 Oats		1918 Hay
	bus	lbs	lbs
Fertilized and limed....	25	10	2600
Fertilized and not limed	22	2	320

The crop on the not limed area was principally a fine water grass, and that on the limed a strong growth of clover, not tall and heavy but of good quality. This shows that clover will persist on wet soils if lime is present.

The illustration accompaying this letter shows the effect of an application of 4 tons limestone per acre applied in 1914 to an area where it was proposed to grow alfalfa. This is a poor sandy area which was never manured and the crop was not large. The alfalfa failed to winter and the land was seeded to wheat with clover and timothy. The limed are produced practically clear clover, and the unlimed area clear timothy, although each were seeded with the same seed. The product shown was taken from the same sized area.

Calculated from the analysis given in feeds and feeding by Henry & Morrison, the clover yield from one acre limed contained 65.19 lbs. of nitrogen, 241.68 lbs. of protein, and the timothy on the area not limed 20.79 lbs. of nitrogen, 63 lbs. of protein.

Now the question is, are we to continue to send to the Southern States for cottonseed meal, high in protein, for our stock, and to Chili for nitrate of soda grow our crops, or are we to make use of ground limestone to fit our soils so that conditions may be suitable for the clover plant and the nitrogen collecting organisms. To do this does not represent a big outlay, for in none of the tests given above have more than 4 tons per acre of ground limestone been used in 6 years. Applied every three years two tons appears to be ample. It has been found that the best time to apply is when seeding down with grain. .

MANUFACTURE OF CREAMERY BUTTER

(Continued from page 540)

allow all free moisture to escape. Then make a test for moisture, and salt by the trench system, adding at the same time the water necessary to bring the moisture content up to the point desired. Work the butter from 15 to 25 minutes to ensure a perfectly uniform color, thorough dissolution of the salt and a perfect incorporation of moisture with a bright smooth, waxy texture. It is absolutely necessary for every creamery to be supplied with acid tests and moisture tests, and in addition a fat test of each vat must be made each day if we wish to do our work intelligently and produce a uniform quality of butter. To simply say you have not the time cannot be accepted. You must make up your mind that you have got to take the time to perform these tests or else get out of the business, and I may tell you right now that the butter makers who think anything is good enough and that performing these necsesary tests is too much trouble had better quit while the quitting is good.

We have not been able to determine the value, or otherwise, of a pure culture and hope to do some work along this line next season. In the meantime I have no hesitation in recommending the installation of pasteurizers and following the instructions already outlined. If we do I am hopeful we will be heard from more favorably next year at our annual expositions that we have the past few years.

.—An address by L. A. Zufelt, Superientedent of Eastern Dairy School, Kingston, Ont., at Annual Convention Dairymen's Association of Eastern Ontario, held at Belleville recently.

$5.00 FOR $4.00

W-S S

And every Dollar worth more

Farmers!

The buying power of the dollar today is very low. That is why you obtain such prices for the food you raise.

During the next five years, the buying power of the dollar will rise. Every four "low-powered" dollars you invest in War-Savings Stamps this month will bring you five "high-powered" dollars in 1924, when food will not command present prices.

Invest every dollar you can in W-S.S. which are sold at Money-Order Post Offices, Banks and other places displaying the W-S.S. sign.

THRIFT STAMPS—25 cents each—are sold where W-S.S. are sold and by patriotic storekeepers. Sixteen Thrift Stamps on a Thrift Card represent $4.00 in buying a W-S.S.

BUY WAR-SAVINGS STAMPS

Next month W-S.S. will cost one cent more—$4.01.

WINTER WORK FOR THE BEE-KEEPER

(Experimental Farms Note)

Now that the most active part of year is over and the bees are safely packed away in their winter quarters, the beekeeper should turn his attention to the preparation for next year's activities. As the honey gathering season is comparatively short and things move very rapidly during that time, success depends mainly upon having everything in readiness before it is actually needed. Much of the work can be done during the winter months.

One of the most valuable assets of the beekeeper is a good supply of empty combs at the commencement of the season and great care should be taken to preserve them during the winter months from the ravages of mice and wax moth. A good method is to place the combs in supers and to tier the supers up one above another with a sheet of paper between each and a hive cover on top of the tier. this will prevent the mice from getting at them. The combs should be stored in a dry cold place. Exposure to zero weather will destroy the larvae of the wax moth. Fumigation with carbon bisulphide will also destroy them but care must be exercised in handling this material as it is highly inflammable.

All supplies should be thoroughly gone over and put into working shape. If any new supplies are required, order them as early as possible and get them made up before spring. By sending early orders, you not only benefit yourself but you are aiding the manufacturer to fill all orders in time. tI is not adviable to put foundation in the frames till spring as it becomes very brittle in the cold weather and there is danger of breaking it in handling. If you have only old broken combs, capings, etc., now is a good time to get them rendered, using a wax pres for this purpose and to have the resulting wax made into founda tion.

Protect your bees from mice by having the entrances to the winter cases reduced too small or by covering with a screen too small for mice to get through, but large enough to allow the bees to pass through freely. The entrances of the hives in the cellar can also be closed by this screening The temperature of the cellar should be kept at 45° F. The cellar should be dark, and well insulated against changes in temperatur.

If the bees were placed in winter quarters rather light in stores, it may become necessary to feed them before bringing them out in spring. For this purpose, candy made as follows is recommended:—Stir 6 pounds white granulated sugar into one eighth pints of boiling water. When the sugar is thoroughly dissolved, and ¼ teaspoonful tartaric acid and boil at a temperof 240° F. over a hot fire for 3 to 4 minutes without stirring. Allow the mixture to cool to 130° F. and then stir till it begins to whiten. Then pour quickly into moulds, making cakes about one inch in thickness. When cool these cakes can be placed on top of the frames above the cluster.

POTATO GRADING

Fruit Commisioner's Office,
Ottawa, Jan. 17, 1919

Editor Maritime aFrmer,
Sussex N. B.

Dear Sir,—

For your information we are sending you herewith copy of a letter, which has been sent from this office to the Agricultural Societies and Institutes in all parts of Canada in regard to the matter of the grading of onions and potatoes. A similar letter was sent to the wholesale fruit and vegetable dealers.

Within the past week a great many replies to these letters have been received at this office and practically all of these indicate a very enthusiastic suport of compulsory grading measures. I thought that possibly it might interest your readers to know that the opinions of growers and dealers in all parts of the Dominion are solicited and will be much appreciated by this department. We are sure that among those who subscibe to you publication there must be many who have opinions on this subject and we would be very glad indeed if you could give this matter a little of your valuable space in an early issue. ,

Potato grading for some years has been voluntarily adopted in British Columbia and New Brunswick with very great success, but before taking further action in the matter, we wish to receive the view points of those who have given particular study to this question.

Thanking you in advance, I am,
Yours very truly,
C. W. BAXTER,
Commissioner.

Re Grading Potatoes and Onions

Ottawa, Jan. 7, 1819

Dear Sir,—

During the past few years the Department of Agriculture has received numerous requests from growers, growers' marketing organizations and dealers for the establishing by law of grades for potatoes and onions. Commercial grades have been established but these have proved to be most unsatisfactory during the period of weak and declining markets.

During the last Session of the Dominion Parliament potato grades were established. The use of these was made optional as at that time it was deemed inadvisable to place any possible obstruction in the way of greater production and marketing of potatoes as a substitute for wheat products which were so esential to the successful prosecution of the war. The present optional grades were created for the purpose of enabling buyers and sellers at great distances to transact business with a greater degree of confidence. No grades, however, were established for onions.

Now that the end of the war is in sight it would seem to be an opportune time to consider the advisability of establishing grades for both potatoes and onions. If your Association is interested in this matter we would be very glad if you will bring it before your members at your next meeting and forward us any recommmendations or suggestions they may care to make.

Yours faithfully,
C. W. BAXTER.
Commissioner.

COMMON PARASITES OF SWINE

(Experimental Farms Note)

Swine are subject to several parasites external and internal. Of the first class the most troublesome is the ordinary hog-louse. These insects are responsible for such unthriftiness and poor gains; are an adveritsement of the unobservant eye or carelessness of the feeder and the intolerable in that unless the infestation is of long standing, they are fairly easy of eradication.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

MRS. M. SUMMERS, Box 309
Windsor, Ont.

Methods of Eradication

1.—Pigs may be dipped or sprayed with any good creolin or coal-tar disinfectant, made up as per directions accompanying the preparation.

2.—Coal oil or kerosene is used by some. Though effective it has a blistering action and should be avoided.

3.—Fuel oil is highly recommended. Experiments with it at Ottawa proved it efficient, but slightly irritant and leaving th ehair of the pigs in a dirty, discolored condition.

4.—Crude castor oil is non-irritant, soothing and quite destructive to lice. Where procurable it forms possibly the best application for this purpose. At present, the price of castor oil is too high to permit of its use for such purpses.

5.—Paraffin oil (low grade) as now used in the herd of swine at the Central Experimental Farm, has proven non-irritant to the sckin and quite effective as an insecticide. It is cheap, easily procurable and colorloess.

6.—Apply disinfectant (creolin, etc.) with a brush, broom, spray pump, or in the case of the large herd, by the dipping method. Apply oils with a cloth or more conveniently still by using a large oil can with a handle and long spout. File a short section from off the end of the spout to increase the amount delivered. Apply a stream of oil over the neck, shoulders and along the back. The heat of the body will cause the application to spread conveniently over the body. A large number of hogs can be treated conveniently and quickly by such means.

7.—Repeat the application after ten days to destroy the lice or nits.

8.—If pigs are seen to be badly infested, a thorough clean-up of the premises would be indicated, using a strong creolin over all.

Intestinal Parasites

Of intestinal parasites the round worm is much the more common. In most cases examination of the smaller intestine of slaughtered pigs will reveal the presence of a few large white worms. In small numbers they appear to cause little inconvenience to the animal; a considrable infestation will cause a marked falling off in general condition. Young pigs so affected are thin, stunted and lacking in vigor and thrift. Severe infestation will frequently cause intestinal inflammation or stoppage, resulting in death.

Cause

Where pigs are kept reasonably clean, and supplied with fresh water, the danger of infestation is small. Filthy suroundings together with stagnant or foul water usually predispose to such parasitic infestation.

Treatment

Prevent by cleanly methods and the use of any good mineral corrective mixture. There are a number of these on the market. A good home-made substitute is a mixture of charcoal, wood ashes and salt; or of sulphur, salt and iron sulphate mixed in equal parts,—take one part with 8 parts charcoal and 8 parts ashes, mix well and allow the animals free access to it.

Where pigs are infested, turpentine is the best remedy. Give 1 teaspoonful to every 100 pounds weight, after fasting the animal for twelve hours. This may be mixed in the feed and given for three successive days. Follow this with a good purging of Epsom Salts.

SHORT COURSE OPENING POSTPONED

Truro, N. S.—Owing to the general influenza situation throughout the Maritime Provinces, it has been decided to temporarily postpone the Short Coure at the College of Agriculture, Truro, N. S. The date on which this course will open will not be decided for a little time but when it is decided full advertisement will appear in our columns.

Candy a Splendid Food

One of the most attractive forms in which food can be eaten—is candy.

Candy is composed principally of sugar, nuts, fruits, some fats such as butter, and chocolate.

All these ingredients are recognized by eminent medical authorities as food products, which the system craves and demands.

Let us examine their food values separately.

We all know that sugar is a body-building essential; about one-quarter pound of sugar being required by an adult every twenty-four hours.

Nuts and fruits yield a high percentage of nutritious materials.

Fats supply the bodily fuel and should be used in every dietary.

Chocolate is a delightful stimulant, especially valuable in restoring energy.

Combine these ingredients and are they not still food?—satisfying, nutritious, essential and in a most delightful and properly balanced form.

Eat more candy. Candy is beneficial to all and harmful to none.

Serve Candy as a Dessert.
It Is a Splendid Food.

Butter Parchment at Farmer Office

Lawndale Stock Farm
Jerseys and Shorthorns (Pure Bred)

JERSEYS:—

One registered Bull Calf, solid colour, (fawn) dropped in October, 1918. Out of a R. O. M. dam, by a "Golden Fern's Lad" sire.

Our latest importation consists of a young cow and yearling heifer, direct from the Island of Jersey.

SHORTHORNS:—

One registered Bull Calf, red, little white, dropped in March, 1918. He is large, in splendid condition, and out of a fine milking dam.

One or two heifer calves, red, little white, dropped in the summer of 1918, out of good milking dams; all three of the aforementioned calves are sired by the best son of "Stately Monarch", Champion in three Provincial Shows.

Our latest importation is a new Herd Bull, direct from the Milking Shorthorn herd of Lord Rothschild, Tring Park, England.

I. M. LOVITT, M.D.,
Yarmouth North, - Nova Scotia

Maple Green Farm Holsteins

Just now we are offering some fresh calved cows and some due to freshen shortly, also yearling heifers and heifer calves, all with official records or from official record dams. Remember this is the only herd in Eastern Canada which owns two Jr. 3 year olds with official records of 25.05 and 26.54 lbs. butter in 7 days.

Herd sires in service, "Maple Grove Mercena Mercedes," No. 11727, the sire of our 26.54 lb. Jr. 3 year old and who so far has not a tested daughter testing under 4%. Our Jr. herd sire, "Homestead Hengerweld Rooker," No. 20652, three-quarter brother to our 25.05 lb. Jr. 3 year old.

For particulars write

Butter Parchment at Farmer Office

SILO THE "FLOUR BARREL" OF THE HERD

"The silo is esentially an immense barrel int owhich grain feed, like corn, is put, to be used later as feed for livestock," says Prof. R. M. Washburn, of the University of Minnesota. "It has been known and used for thousands of years but the knowledge of the underlying principles of its construction and the machinery necessary for its filling, needed to make it really practical, have not been possessed until within the past decade or two. During the past twenty years, and especially the last ten years, the number of silos has multiplied enormously. Very few who have used them would be without them. Those people who do not believe in the silo are usually the people who have had no recent experience with them.

"The writer, a few years ago, convinced a farmer well past middle life, who had been reasonably successful all his life on the farm, that he would be more successful in his livestock work if he had a silo. He built and after one year's use was asked what he thought of it. His reply summarized the case well. He said:

"My cows never milked so freely throughout the entire winter as they have this year. They lived so largely upon silage that I have several tons of hay to sell, which I had expected to have to feed them and would have fed them under former conditions; and lastly, the cows came out in the spring in such good condition that they shed their hair early, and went on to grass prepared to make full use of it. I am convinced that the silo has paid for itself the first year."

The Annual meeting of the Nova Scotia Poultry Association will take place at the Agricultural College, Thursday, March 13th, at 10 A. M.

BREEDERS' DIRECTORY

Our charge for inserting names in this Directory is $2.00 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up Stamps taken.

Dreamy, Caressing Hawaiian Music

The magic melody of the throbbing Ukelele and the singing Hawaiian Guitar---blended with plaintive charm of native voices---instantly takes a strong hold on your imagination.

Listen to the way in which the haunting minor strains and booming major notes ---redolent of giant breakers on palm fringed beaches---and recorded on Columbia Records. You CAN'T forget them.

ALOHA OE and HAWAIIAN MEDLEY Toots Paka Hawaiian Co. A1616. 10-inch, 90c.

KAOWE AKE KAI (The Roaring Sea) and LIA IKA WAI MAPUNA (A Lonely Spring). Toots Paka Hawaiian Co. A1571, 10-inch 90c.

WAILANA WALTZ (Drowsy Waters) and HAWAIIAN MEDLEY. Louise and Ferera. A2016, 10-inch 90c.

KILIMA WALTZ and HAWAIIAN HOTEL, by Palie K. Lua and David K. Kaila. A1874, 10-inch 90c.

MAHINA MALAMALAMA (Waltz). Kalani and Kalei, and NA LEI O HAWAIIA. Holstein and Octette Guitar and Ukelele accompt. A1985, 10-inch 90c.

HILO—HAWAIIAN MARCH. Irene West Royal Hawaiian Troupe and KOHALA. Palie K. Lua and David K. Kaili. A1812, 10-inch 90c.

The rythm, the swing, the tuneful charm of Hawaiian music will make many a home evening a refreshing delight.

Here, particularly, you will appreciate the master tone of the Grafonola—always superbly under control by the exclusive Columbia tone leaves.

Your dealer will gladly play many Columbia Hawaiian melodies for you—and will tell you all about Columbia Grafonolas —every one musically perfect, whatever its price.

Feeding Cattle in Nova Scotia

(Continued from last issue)

Rations Nos. 10 to 13 are made up to show how some of the special feeds mentioned may be used. They are made up for cows weighing approximately 1000 lbs. and giving about 25 lbs. of milk daily. If more milk is being given, about one pound of the grain mixture should be added to the ration for every 3½ lbs. of milk above 25 lbs. The roughage should not exceed what the cow will eat up clean except in the case of straw when a larger amount may be given allowing the cow to pick out what she wants and using the rest for bedding.

The question of what feeds should be grown on the farm in order to enable the farmer to make up the most economical ration should be carefully considered by all dairymen. The crops that are best suited to Nova Scotia are grass for pasture and hay, oats, barley and turnips, and oats, peas and vetches for silage, and in some parts of the province corn. If a farmer is supplied with good mixed hay, O. P. V. silage, turnips and oats he will only need to buy a small proportion of his cow's daily ration. I cannot impress too strongly upon the farmer the fact that an extensive cultivation of those crops that are naturally suited to the Nova Scotia climate is the surest road to success in feeding all forms of live stock.

Ration No. 14 shows how small an amount of feed needs to be bought when the farmer raises a large variety of crops.

Altho oats are used as an ingredient of several of the rations given above, ti will often pay better to sell some of them and buy other feeds such as middlings or gluten, or oil meal. When the farmer is some distance from market and has more oats than he needs for his horses he can feed them to the cows to good advantage. In most cases they should be crushed before feeding to cattle, altho whole oats may be fed to calves with good results.

The O.P.V. silage mentioned in a number of the rations is made from oats, peas and vetches grown together; oats and peas may be grown for the same purpose, when vetches are hard to get. Where the climate is not suited to corn, as is the case for the northern and eastern parts of the province, this mixture has proved valuable. It is sown early in the spring on good land and harvested from the 1st to the midde of August. The mixture for 1 acre is made up of two and a half bushels of oats, three quarters of a bushel of peas, and one third of a bushel of vetches, or two and a half of oats and one of peas. It should be cut when the oats are just coming into the dough stage, just before the straw begins to turn yellow. If cut too late it is too light and strawy and will not pack well in the silo. It has been fed for four years to the College herd and has given good results. Ten tons or more of green feed should be grown per acre, which is equal to over three tons of dry hay. Anyone interested in growing this crop can get full information by writing to the College.

The feeding of dairy cows during the summer months should have more attention than it often receives at the hands of the farmer. It is a common practice to turn cows out to pasture in the latter part of May and give them no extra feed until they are put in the barn again in the fall. In order to make this method profitable the pasture must be of the very best. In most cases the dryer weather of July and August shortens up the grass and the cows shrink a great deal in their milk flow. Where pastures become short in this way it is imperative that some supplementary feed be given if any large flow of milk is to be maintained. Some green forage is valuable at this time. It may consist of clover from the hay field in July, of oats and peas in August, and of corn and white turnips in September and October. The oats and peas should be sown thickly on good land as early as possible in the spring. Sown the latter part of April or the early part of May they will be ready for feeding by the middle of July, or sometimes earlier. A second sowing made the ast of May will be ready for feeding in August. (2½ bus. oats, ¾ bus. peas per acre).

In addition to the green feed a small quantity of bran and cotton seed meal may be fed to advantage. Cows that have been milking a long time and are only giving 20 to 25 pounds of milk

(Continued on page 592)

The following table gives the total analysis of some of the feeds found on the market in Nova Scotia.

BRAN GROUP.

(These feeds are especially well suited to the dairy cow, and may form the larger part of her grain ration.)

	Total Protein %	Total Fiber %	Total Fat %	Total nutrients except fibre, sum of protein, starch, sugar, etc. and fat
Dried Beet Pulp	8.9	18.9	0.9	
Eureka Feed	9.5	13.0	4.5	
Sampson Feed	10.0	10.0	4.0	
Echo Feed	10.28	14.47	5.57	
Schumacher Dairy Feed	10.4	10.5	4.0	
Banner Dairy Feed	10.5	10.0	4.0	
Ground Special Screenings	13.3	18.8	4.01	62.61
Ground Standard Feed	14.38	10.32	4.92	76.94
Wheat Bran (Spring wheat)	15.7	10.2	4.8	73.10
Molasses Dairy Feed	17.18	15.82	4.05	62.94

MIDDLINGS GROUP.

(These feeds low in fibre are especially suited for pigs, as well as for cows.)

Hercules Feed	10.0	8.5	2.5	
Recleaned unground Wheat Screenings	14.0	8.0	5.0	78.5
Monarch Hog Feed	15.0	8.0	4.0	
Red Dog or Feeding Flour	16.8	2.2	4.1	84.2
Standard Wh. Midd (Shorts)	17.4	6.0	4.9	79.14
Flour Wheat Middlings	17.8	4.7	5.0	80.9
Low Grade Gluten Feed	17.8	6.9	5.7	83.2
Molasses Hog Feed	17.26	13.79	5.39	78.35

LINSEED MEAL GROUP

(These are the special high protein feeds.)

High Grade Gluten Feed	25.4	7.1	3.8	82.1
Buckwheat Middlings	28.3	4.8	7.4	78.4
Linseed Meal (Old process)	33.9	8.4	7.5	77.1
Cotton Seed Meal (Prime)	33.8	10.0	8.3	75.5

SPECIAL FEEDS

Special Feeds	(Oat Feed	4.75	2.70	2.25	61.10
	(Cotton Seed Feed	24.50	21.4	6.3	65.40
	(Corn Meal	9.3	2.3	3.8	87.4

*Cotton seed feed may have less protein and more fibre.

The following table gives the digestible protein and total digestible nutrients found in the standard feeds on the market, and raised on Nova Scotia farms. It is this kind of a table that has been used in making up the rations in table used in last issue.

FEEDING STUFF		Digestible Nutrients in 100 lbs. Crude Protein lbs.	Total Nutrients lbs.
Whole Grains	Peas	19.0	76.2
	Rye	9.9	81.0
	Oats	9.7	70.4
	Wheat	9.2	80.1
	Barley	9.2	79.4
	Buckwheat	8.1	63.4
	Corn	7.5	85.7
By Products	Cotton Seed Meal	37.0	78.2
	Oil Cake Meal	31.7	75.9
	Buckwheat Middlings	24.6	76.6

P. E. I. Poultry Association Show Prize Winners

Following is a list of awards at the Poultry Show held in Charlottetown, P. E. I., on January 44th to 17th, under the ausices of the P. E. I. Poultry Association.

Anconas—C. H. Smyth, Moncton, 1st and 2nd Cock, 1st and 2nd Hen, 2nd and 3rd Cockerel, 1st, 2nd and 3rd Pullet.

E. J. Vessey, York, 3rd Cock, 3rd Hen, 1st Cockerel.

Light Brahmas—C. H. Smyth, 1st, 2nd Cock; 1st and 2nd Hen; 1st Cockerel, 1st Pullet.

Bantams Rose Comb—A. F. Houston, 1st Pullet.

Cochin Bantams—A. F. Houston, 1st Cock; 1st and 3rd Hen; 2nd Cockerel, 1st Pullet.

C. H Smyth—2nd Cock. 2nd Hen, 1st Cockerel, 2nd Pullet.

Game Bantams—A. F. Houston, 1st and 2nd Cock, 1st and 2nd Hen, 1st and 2nd Cockerel, 1st and 2nd Pullet.

A. O. V. Bantams—Fred Blanchard, 1st Cock, 1st and 2nd Hen.

A F. Houston, 1st Cockerel, 1st and 2nd Pullet.

Games, Old English—Bert Carr, Charlottetown, 1st and 2nd Cock, 1st, 2nd and 3rd Hen, 1st and 2nd Cockerel, 1st, 2nd and 3rd Pullet.

Frank Power, Charlottetown, 3rd Cock.

Pencilled Hamburgs—A. Boswell, Frenchfort, 1st, 2nd and 3rd Cock, 1st, 2nd and 3rd Hen, 1st, 2nd and 3rd Cockerels, 1st, 2nd and 3rd Pullet.

Houdans—H. Lapthorne, Charlottetown, 1st Cock, 1st Hen, 1st Cockerel, 1st and 2nd Pullet.

Lanshangs—C. H. Smyth, 1st and 2nd Cock, 1st and 2nd Hen, 1st and 2nd Cockerel, 1st and 2nd Pullet.

S. C. White Leghorns—W. J. Pickard, 1st and 3rd Cock, 1st and 3rd Hen, 1st and 3rd Cockerel, 1st, 2nd and 3rd Pullets.

John Whitlock, Chtown, 2nd Cock, 2nd Hen, 2nd Cockerel.

S. C. Brown Leghorns—J. R. Brown, 1st Cock, 2nd and 3rd Hen, 1st Cockerel.

W. Whitlock, Chtown, 2nd Cock, 1st Hen, 2nd Cockerel, 2nd Pullet.

Brent Hooper, Chtown, 1st and 3rd Pullets.

John Feetham, Halifax, 3rd Cock.

Buff Leghorns—John Feetham, 1st Cock, 1st and 2nd Hen.

Fred Blanchard, Charlottetown, 3rd Hen, 1st Cockerel, 1st and 2nd Pullet.

A. O. V. Leghorns—Brent Hooper, 1st and 2nd Cockerel, 1st and 2nd Pullet.

S. C. Black Minorcas—W. J. Cudmore, Charlottetown, 1st and 2nd Cock, 1st, 2nd and 3rd Hen, 1st, 2nd and 3rd Cockerel, 1st and 2nd Pullets.

Albert Williams, Charlottetown, 3rd Cock, 3rd Pullet.

Rose Comb Minorcas—Albert Carr, 1st Cock, 2nd and 3rd Hen, 1st and 2nd Cockerel, 1st, 2nd and 3rd Pullets.

Buff Orpingtons—Jos. Costello, Charlottetown, 1st Cock, 1st Hen.

Barred Plymouth Rocks—T. C. Latham, Alma, N. S., 1st and 2nd Cock, 1st, 2nd and 3rd Hen, 1st and 3rd Cockerel, 1st, 2nd and 3rd Pullet.

White Plymouth Rocks—Earl Boswell, Scotchfort, 1st Cock, 1st Hen, 1st Cockerel, 1st Pullet.

S. C. R. I. Reds—Otto Hoffman, Charlottetown, 1st Cock, 1st, 2nd and 3rd Hen, 1st Cockerel, 1st and 2nd Pullet.

John Whitlock, 2nd Cock, 2nd Cockerel, 3rd Pullet.

Rose Comb R. I. Reds—Jos. White, Charlottetown, 1st Cockerel, 1st Pullet.

Black Spanish—Wm. L. Acorn, Charlottetown, 1st and 2nd Cock, 1st and 2nd Hen, 1st and 2nd Cockerel, 1st and 2nd Pullet.

White Wyandottes—George Lightizer, Charlottetown, 1st and 3rd Cock, 1st Hen, 1st and 2nd Cockerel, 3rd Pullet.

Jos. White, Charlottetown, 3rd Cockerel, 3rd Hen, 1st and 2nd Pullet.

Fred Blanchard, 2nd Cock, 2nd Hen.

Patridge Wyandottes—John Feetham, 1st Cock, 2nd Hen.

Jos. Costello, 2nd Cock, 1st Hen, 2nd Cockerel, 2nd and 3rd Pullet.

H. Lapthorns, 3rd Hen, 3rd Cockerel, 1st Pullet.

Columbian Wyandottes—George B. Williams, Charlottetown, 2nd and 3rd Cock, 1st and 2nd Hen, 1st Cockerel, 1st, 2nd and 3rd Pullet.

John Williams, Charlottetown, 1st Cock, 3rd Hen, 3rd Cockerel.

Amos Acorn, Charlottetown, 3rd Cock, 2nd Cockerel, 3rd Pullet.

A. O. V. Wyandottes—William Beazley, Halifax, N. S., 1st and 3rd Cock, 1st and 3rd Hen, 1st and 2nd Cockerel, 1st, 2nd and 3rd Pullet.

G. B. Williams, 2nd Cock, 2nd Hen, 3rd Cockerel.

Any Variety Named—Brent Hooper, 1st Cock, 1st and 2nd Hen.

Leghorns—Breeding Pen—W. J. Pickard, 1st Adult, 1st Young.

T. C. Latham, 2nd Adult.

J. H. Whitlock, 2nd Young.

John Feetham, 3rd Adult.

Minorcas—W. J. Cudmore, 1st Adult, 1st and 2nd Young.

Plymouth Rocks—T. C. Latham, 1st Adult, 1st Young.

Wyandottes—Jos. White, 1st Adult, 1st Young.

Geo. Lightizer, 2nd Adult, 2nd Young.

Bantams—A. F. Houston, 1st Adult.

C. H. Smyth, 2nd Adult.

Utility Barred Plymouth Rocks—Andrew F. Peters, Rollo Bay, 1st Cock, 3rd Hen.

C. T. Ferguson, Marshfield, 2nd Cock, 2nd Hen, 2nd Cockerel, 1st Pullet.

E. J. Vessey, York, 1st Hen, 1st Cockerel, 2nd Pullet.

Arthur Sexton, ChTown, 3rd Cockerel.

Walter McLellan, ChTown, 3rd Pullet.

Utility White Wyandottes—Rev. M. Monaghan, Miscouche, 1st Cock, 1st Hen, 1st Cockerel, 1st Pullet.

E. J. Vessey, 2nd Cock, 2nd Hen, 2nd Pullet.

T. B. Woodman, Charlottetown, 3rd Cock.

Utility, White Leghorns—R. B. McKinley, North River, 1st Cock, 2nd Hen.

Wm. Neale, Bear River, 1st Hen, 2nd Cockerel, 1st Pullet.

Wallace Acorn, Charlottetown, 1st Cockerel.

Geo. M. Ballum, 3rd Cockerel, 2nd and 3rd Pullet.

Utility Brown Leghorns—John Feetham, 1st Cock, 1st Hen, 1st Cockerel, 2nd Pullet.

Robert Rhynes, Dunstaffnage, 2nd Cockerel, 1st Pullet.

S. C. Black Minorcas—Wallace Acorn, 1st Cock, 2nd Hen.

J. T. Beagan, Johnston's River, 2nd Cock, 1st Hen, 2nd Cockerel, 3rd Pullet.

Lilly Cairns, St. Teresa's, 1st Cockerel, 1st Pullet.

Clic Mullins, ChTown, 3rd Cockerel, 2nd Pullet.

S. C. R. I. Reds—E. Howatt, French River, 1st Cock, 1st Hen, 1st Cockerel, 1st Pullet.

E. Waller City, 2nd Cock, 2nd Hen, 2nd Cockerel, 2nd Pullet.

T. B. Woodman, 3rd Pullet.

Breeding Pens—Barred Plymouth Rocks—C. T. Ferguson, 1st Adult, 1st Young.

Wm. Neale, 2nd Young.

J. E. McLarty, 3rd Young.

White Rocks—Ledwell Boswell, 1st Adult, 1st Young.

White Wyandottes—Rev. M. Monaghan, 1st Young.

E. J. Vessey, 2nd Young.

Ledwell Boswell, 3rd Young.

White Leghorns—W. Neale, 1st Adult.

Peter Brodie, York, 1st Young.

Essay on Poultry—1st Lilly Cairns, Baldwin's Road; 2nd, Andrew Lewis, St. Peters; 3rd, David S. Rcss, Eldon.

SPECIAL AWARDS

1.—Silver Cup donated by the Hughes Drug Co., for the best display any one variety, W. J. Cudmore.

2.—Silver Cup, donated by Carter & Co., for best Breeding Pen, any variety, W. J. Cudmore.

3.—Silver Cup, donated by Henderson & Cudmore, for the best cock and hen any variety, W. J. Pickard.

4.—William Kerr, $5.00 for best and largest display Barred Plymouth Rocks (Utility), G. T. Ferguson.

5.—William Kerr, $5.00, for best and largest display of White Wyandotts (Utility), Rev. M. Monaghan.

6.—George Lightizer, $5.00, for best and largest display White Wyandotts (Standard), donor not competing, Jos. White.

7.—J. F. McLarty, $3.00 for best School Club exhibit, St. Theresa's Poultry Club.

9.—Harris Abattoir Co., $2.50 for best box chickens packed for export, Artemas Betts.

10.—Harris Abattoir Co., $2.50 for best 30 doz eggs (Extras), E. J. Vessey.

11.—Premier Arsenault, $2.00 for best Cockerel and Pullet, S. C. Rhode Island Red (Utility), E Howett.

12.—Commissioner of Agriculture offers a pair of Rock Chickens for the best essay on poultry, by a member of a School Club. A pair of White Wyandtts for 2nd best, Lilly Cairns, Baldwin's Road.

13.—Andrew Lewis, St. Peters.

14.—Buntain and Bell, $2.50 for best cock, hen, cockerel and pullet Barred Rocks (Standard), T. C. Latham.

15.—W. S. Louson, $2.50 for best cock, hen, cockerel and pullet, White Rock (Sandard), Earl Boswell

16.—Sims Packing Co., $2.50 for best cock, hen, cockerel and pullet White Wyandotte (Standard) George Lightizer.

18.—Fennell & Chandler, $2.50 for best cock hen, cockerel and pullet, Brown Leghorn (Standard), William Whitlock.

19.—Island Cold Storage Co., Ltd., $2.50 for best cock hen, cockerel and pullet, Black Minorcas, S. . (Standard), W. J. Cudmore.

20.—A. F. Houston, $2.50 for best cock, hen, cockerel and pullet, Black Minorcas R. C. (Standard), Albert Carr.

26.—E. T. Hggins, $2.00 for best Breeding Pen of Leghorns (Standard), W. J. Pickard.

27.—E. A. Foster, $2.00, for best Breeding Pen of iMnorcas (Standard), W. J. Cudmore.

29.—McKinnon Drug Co., $2.00, for best Breeding Pen of Rhode Island Reds (Standard), Otto Hoffman.

30.—Jenkins & Son, $2.00, for best Breeding Pen of Bantams, A. F. Houston.

31.—A. F. Curren, $2.50, for best Breeding Pen of White Rocks (Utility), C. T. Ferguson.

33.—Albert Carr, $2.50, for best Breeding of White Rocks (Utility), Ledwell Boswell.

34.—A. F. Curran, $2.50, for best Breeding Pen of Wyandotts (Utility), Rev. M. Monaghan.

36.—L. E. Prowse, $2.00, for best Breeding Pen of Leghorns, Brown, (Utility) John Feetham.

38.—Gunn Langlis Montreal, $2.00, for best Breeding Pen of Minorcas, (Utility), J. F. Beegan.

39.—Otto Hoffman, $2.00, for best Breeding Pen of Rhode eIsland Reds, S. C. (Utility), E. Howett.

21.—Carvell Bros., $2.50, for best cock, hen, cockerel and pullet, Rhode Island Red, S. C. (Standard), Alto Hoffman.

22.—R. V. Longworth, $2.50, for best cock, hen, cockerel and pullet, White Leghorn (Standard), W. J. Pickard.

24.—L. M. Poole & Co., $3.00 for best Breeding Pen Barred Rocks, (Standard), T. C. Latham.

25.—A. Irwin, $3.00, for best Breeding Pen of Whte Wyandotts (Standard), Jos. Whte.

41.—Buntain & Bell, $2.50, for best cock, hen, cockerel and pullet, Barred Rock ,(Utility), C. F. Ferguson.

42.—W. S. Louson, $2.50, for best cock, hen, cockerel and pullet, White Rock, (Utility), V. O. Skinner.

43.—Sims Packing Co., $2.50, for best cock, hen, cockerel and pullet, White Wyandotts, (Utility), Rev. M. Monaghan.

45.—Fennell & Chandler, $2.50, for best cock, hen, cockerel and pullet, White Leghorn (Utility), Wm. Neal.

46.—President Longworth, $2.50, for best cock, hen, cockerel and pullet, Brown Leghorn, (Utility), John Feetham.

47.—Island Cold Storage Co., Ltd., $2.50, for best cock, hen, cockerel and pullet, Mincorcas (Utility), J. T. Reegan.

48.—Carvell Bros., $1.00 for best cock, hen, cockerel and pullet, Rhode Island Reds, S. C., (Utility), E. Howett.

50.—H. E. Cantwell, $1.00, for best pair of A. O. V. Geese, John Whitlock.

51.—Ivan Redin, $1.00, for best pair of Pekin Ducks. Earl Boswell.

52.—Pas Paton, M. L. A., $1.00, for best pair of R. C.Minorcas, Bert Carr.

53.—R. E. Colwell, $1.00, for best pair of Buff Orpingtons, Jos. Costello.

54.—C. W. Patterson, $1.00, for best pair Columbian Wyandotts, Geo. Williams.

55.—W. W. Stanley, $1.00, for best pair of Wyandotts, A. O. V., Wm. Beazley.

57.—Stanley Shaw & Feardon, $1.00 for best pair Partridge Wyandotts, Jos. Costello.

W. N. Tanton, Clock, for best collection Bantams, A. F. Houston.

59.—E. W. Taylor, Clock, for best collection Minorcas, W. J. Cudmore.

60.—Rogerd Hardware Co., Razor, for best pair Leghorns, A. O. ., Brent Hooper.

61.—Carter & Co., 50 lbs. Chick Feed for best pair Rowan Ducks, A. H. Boswell.

62.—Carter & Co., 50 lbs. Chick Food for best pair White Wyandotts, George Lightizer.

63.Amos Acorn pipe stand for best pair Columbian Wyandotts, John Williams.

64.—G. H. Hutcheson, Fountain Pen, for best pair Bantams, C. H. Smythe.

65.—McLeod & McInnis, 1 lb. Tobacco for best pair White Leghorns, W. J. Pickard.

66.—McLeod & McInnis, 1 lb. Tobacco, for best pair Buff Leghorns, John Feetham.

68.—Stanley Shaw & Peardon, $1.00 for best pair Minorcas S. C., W. J. Cudmore.

69.—J. R. Gillis, Watch Fob, for best exhibit any variety shown by member under 13 years of age, John Wiliams.

70.—E. Acorn, $1.00, for best exhibit, Amos Acorn.

71.—Alley & Co., (Special) for largest number of points (Utility), Rev. M. Managhan.

72.—W. W. Wellner (Special) for best collection Pigeons, A. F. Houston.

73.—A. E. Tombs, Flash Light, for best air Houdans, H. Lapthorn.

74.—A. F. Houston, Flash Light, for best pair Pit Games, Bert Carr.

75.—J. D. Jenkins, 50c. for 2nd best pair Pit Games, Bert Carr.

76.—Auld Bros., Ltd., offer 1 package "Royal Purple" poultry specific, 1 pkg. Lice Killer, 1 pkg. Roup Cure, 1 pkg. Chick Feed for the best male and female in the following varieties (Standard and Utility): Leghorns, Minorcas, Plymouth Rocks, Rhode Island Reds, Wyandotts and Orpingtons, W. J. Pickard Leghorns.

77.—W. J. Cudmore, Minorcas.

78.—T. C. Latham, B. P. Rocks.

79.—Otto Hoffman, R. I. Reds.

80.—Geo. Lightizer, Wyandotts.

81.—Jos. Costello, Orpingtons.

82.—Wm. Neale, Leghorns.

83.—J. T. Beegan, Minorcas.

84.—E. Howett, R. I. Reds.

85.—Rev. M. Monaghan, Wyandotts.

86.—C. F. Ferguson, B. P. Rocks.

87.—Not awarded, Orpington.

88.—Beer & Weeks Rocking Chair for best Wyandott cock and hen, Geo. Lightizer.

89.—Gunn Langlois, Montreal, $3.00 for best pair dressed cockerels, A. Betts.

90.—Gunn Langlois, Montreal, $3.00 for best 1 doz. eggs, special, John Whitlock.

91.—Maritime Electric Co., Ltd., $1.00 for best 1 doz. eggs, specials, John Whitlock.

92.—Mayor Wright, $1.00 for best pair geese, Bremen or Emden, Earl Boswell.

93.—Mayor Wright, $1.00 for best pair dresed fowl, Ben Rodd.

94.—W. J. Pickard offers 1 setting of White Leghorn Eggs for the best cock, hen, cockerel and pullet, White Leghorns. And one setting for the best Breeding Pen of White Leghorns, John Whitlock.

95.—W. J. Pickard, $1.00 for the best pair Toulouse Geese, Earl Boswell.

96.—W. J. Pickard, $1.00 for best pair A. O. V. Ducks, Earl Boswell.

98.—W. J. Pickard, $2.00 for the largest and best display water fowl, Earl Boswell.

99.—Maritime Electric Co., Ltd., $1.00 for best cock, hen, cockerel and pullet, Game Bantams, A. F. Houston.

100.—Maritime Electric Co., $1.00, for best pair Cochin Bantams, A. F. Houston.

101.—Cyrus Poitier donates $2.50 for the best and largest display of Rhode Island Reds (Utility) and $2.50 for the best and largest display of Minorcas (Utility), E. Howatt.

102.—J. F. Beegan.

103.—Cup donated by Amos Acorn, for two Columbian Wyandotts, hatched, 1918, Amos Acorn.

104.—S. F. Hardy, 50 pair Buff Leghorns, young, Fred Blanchard.

105.—Colin McDonald, 1 Box Chocolates, for best Wyandott Cock and Hen, Geo. Lightizer.

106.—Art. Nelson, $1.00, for best Breeding Pen Wyandotts, John White.

107.—Som Craig, $1.00, best doz. Brown Shelled eggs, John Whitlock.

108.—E. G. Coombs, $2.00, best cock, and hen ,Partridge Wyandotts, Jos. Costello.

109.—E. G. Coombs, $1.00, cockerel and pullet, Partridge Wyandotts, Jos. Costello.

110.—E. G. Coombs, $2.00, best pair Houdans, H. Lapthorn.

National White Wyandott Challenge Cup awarded Geo. Lightizer.

Some of the Problems Which Co-operation Has Not Solved

Editor The Maritime Farmer:—

Co-operation has done much for the farmer. Wherever given a fair trial it has accomplished far greater results than the most sanguine supporter anticipated. It has brought our farmers together in a way that no other organization has ever done; it has obtained for them important government and municipal concessions, better transportation facilities, better prices for their farm products, opened up new markets and by its strength operating in so many fields of activity, called new attention to the importance and dignity of the farmer.

But though co-operation has accomplished such splendid results it has failed in some respects like all industrial movements to fulfill some of its early expectations. It has solved many of the farmer's problems, but there are others which thus far the movement has failed to solve.

Perhaps the first of these which ought to be mentioned is the problem of the middleman, which is so much in the limelight in these days.

Co-operation probably owes its rise very largely to the dissatisfaction which the producer has experienced, arising from the excessive profits from the handling of his potatoes, fruit or beef. Of the dollar which the consumer paid, the farmer actually received but thirty-five cents. This was felt to be a decided injustice and as a remedy he eagerly seized upon the co-operative movement as furnishing him with the only organization able to transfer to him the fixing of the prices of the products of the farmer. Furthermore he hoped not only to acquire the power of fixation of prices, but also to eliminate altogether the middleman, who seemed an altogether unnecessary link between him and the consumer.

Now as a matter of fact, co-operation has not been able to eliminate the middleman. He is still with us and in some respects doing a more thriving busines than ever. Some middlemen undoubtedly have been put out of business by the co-operative movement and these were the least desirable of the larger brotherhood of traders and dealers without capital with nothing to lose and everything to gain by their relations with the farmer. A large number of this class have undoubtedly been eliminated but the wholesaler, the jobber, the legitimate retailer, the city commission man and even the so-called speculator are still with us.

For one thing it was found to be beyond the financial resources of the co-operative movement to establish wholesale branches of their business at consuming centres; for another thing it was discovered that they lacked the men of the required business experience to conduct successfully those branches, and so the movement realized that it was the part of wisdom to confine its operations to making use of the ordinary channels of trade. To eliminate entirely the middleman was found to be an impossibility and so the movement has set itself to the task of cutting out the irresponsible middleman and limiting the profits of others to a legitimate scale.

Neither has co-operation been able yet to devise a scheme whereby the members may be able to receive full returns for their crops as soon as they are harvested.

This is one of the unattractive features of co-operation, and one of the chief reasons why the speculator prospers side by side with the movement capable of accomplishing so much for the farmer.

A large share of the farmer's yearly financial obligations then become due. They pour in upon him in a regular deluge. Fertilizer bills, feed bills, wages, taxes, bills for barrels, farm machinery, repairs, threshing, pasturage, etc., for all of which he must finance in some way. Of course, if he has been more than ordinarily successful these bills will not accumulate, but will have been liquidated promptly when they were contracted, but the average tiller of the soil is not so forehanded and his bills must wait until he can realize on his crops.

Now no co-operative association has sufficient paid up capital to enable it to advance its members money enough to cover the full value of their members' crops. They may be able to make them part payments to enable them to meet some of their more pressing obligations and further assist them by carrying on their own books still others of their obligations, but to pay them cash down the full value of their crops as soon as delivered to the warehouse as speculator is supposed to do, excepting perhaps, the single case of the Grain Growers of the West, and here the government has come to the assistance of the farmers with special legislation, the Co-operative Association has utterly failed.

The only method so far known by which the co-operation movement can return to its members the proceeds of their crops is to place them upon the markets of the world and to remit to them the returns as quickly after their receipt as possible. This of course often consumes a considreable time, but there is so far no other way known to co-operation.

Then, further, the co-operative movement has failed to cope successfully at all times with the human element in its constitution. This is a problem not peculiar to co-operation, presenting itsefl alike in all social and business organizations, being a disturber even of the peace of the church. Frequently a member receives an offer for his produce which he considers preferable to what he expects to receive from his Association and he sells, or he buys his supplies from a competing firm at a little better rate than his own company can sell them, or maybe he becomes dissatisfied with the management and withdraws for the time being from the Association. Such conduct, however justified it may appear to the member, weakens his company to that extent and if it were to become at all general would speedily disrupt the company.

Ferguson's Alacrity Tomato

SEEDS SELECTED FROM CROWN SETTINGS.

The Alacrity produces a compact vine and is usually ten days earlier than any other strain. The entire crop can be gathered generally, in about three weeks from time first fruit ripens. The Alacrity is without doubt the very best and earliest scarlet fruited tomato. Gardeners who seek to have good smooth tomatoes first on the market can find nothing to equal them.

NEW 1919 CATALOGUE FREE.

One of the finest seed catalogues published. Gives truthful descriptions and helpful cultural directions of the most reliable sorts of vegetable flower and field seeds. Write for your free copy.

GIVE AND TAKE POLICY BINDS FATHER AND SON IN FARM OPERATION

When we think of the ungratefulness of humanity, it opens a field of vastness that our visions fail to encompass. Worthy sons feel deeply the obligations under which they are placed. No time can obliterate from the memory of the loyal, dutiful son the gratitude he owes his father. No statute of limitation bars the payment which can never be in full. Nothing swells the heart, dilates the blood channels and causes a glow of warmth to creep over the body of the hoary-headed father, than the exercise of genuine gratitude of the son for his very being.

The father sees the son grow from the tiny, helpless infant day by day to young manhood, with pride and thankfulness, often little thinking how much help the son will be to him in his declining years, when by the law of nature, man ripens and must lay down the tools of toil and seek rest in the old armchair. Now is when the son can show a gratitude that knows no bounds. How many do it? Many a father has gone to his grave feeling that he had an ungrateful son unwilling to aid him in his declining years and the son feeling that his father was unreasonable.

The reasons for this pulling apart of fathers and sons is lack of training on one side and ingratitude on the other. Sons must be taught to obey, work and manage. Fathers must be taught how to interest the sons in their work that they will step in and take the reins where the father drops them. When boys are well in their teens they desire to make money for themselves, to accumulate property and to have a voice in the management of affairs. Now is when the pulling begins. The father thinks that he has managed, clothed, fed, educated and reared the son and now when he is of the age to be of use to him he wishes pay for every turn he does. The son brands the father as an "old fogy," "backwoodsman," and not "up-to-date!" the son hikes out to a neighbor and the father hires the neighbor's son.

Some sons haven't as much reaspect and gratitude for their father as a horse and dog have for their master; and animals will have no respect for their master unless they are trained to obey him. A professor was once asked when it was best to begin training a child and he replied: "Three hundred years before he is born."

There is no occupation that would be greater blessed with good returns by the unity of father and son than that of farming. How much better it would be to pay his son wages than that of his neighbor? How much better for the son if he could remain on the farm and step in the footsteps of his father? Many farmers' sons go to the cities and join the throng of unskilled laborers and buy every morsel that goes between their teeth. The father must not be unreasonable; he must strive to hold the boys on the farm and as they grow older make them an equal partner with him. Be willing to make concessions, use tact and prove yourself to be a general. We read of diplomacy—but the father who holds his sons together and handles them to the best advantage, is the greatest diplomat of all.

The soft, mushy and fertile brain of the developing youth overflowing with egoism, conceit and self-esteem is a problem to handle; they think they know it all. That round sphere on top of their shoulders filled with a soft, undeveloped conglomeration of white and gray matter called cells, belches out many queer ideas through the aperture called the mouth. The father must be equal to the occasion. Now is the time to show his generalship. You have worried, fretted and labored over the youth in his infancy and with the aid of the loving and ever faithful mother you have remained by the bed of sickness night after night fearing each moment that the next would be all in vain. You may have thought this to be a great task, but lo, the task has just begun and it will be in proportion to the weakness of your generalship. If you have not taught that son the evils of intemperance, frugality, the value of a dollar and the price of wickedness he will be a thorn in your side to the day when your eyes are closed forever.

People cannot be driven to see their mistakes of evil ways; they must be led unconsciously into the paths of right and rectitude. Children are imitators, therefore how can you expect your sons to refrain from chewing, smoking, drinking, wickedness and squandering money if you do? Get right yourself; good examples are the best of instructors. You cannot drive the youth to see their folly; compulsion stirs up a reservoir of rebellion within the human body and as the poor decrepit liver is accused of everything, we suppose it is the store-house of contrariness. You may just as well attempt to drive a man to do a thing as to stop a cyclone with an umbrella.

There is another thing that is baneful in its effects and that is the teaching of others in getting young boys dissatisfied with their home surroundings. Many fathers would get along better with their sons if the boys were not coached to leave home by meddling people, and often these very meddlers are married men with sons of their own to see after. Shame on such fathers. Better attend to your own affairs and see that your sons are not worked too hard and that they have plenty of spending money and what not.

Fathers are largely responsible for many of the unpleasant turmoils occurring in the farm life; many feel they are king of the plantation and the big "it" and will not even permit a single suggestion from the sixteen-year-old son who thinks by this time that he is some "pumpkin" and should be seen and heard. The father cannot get the son interested in the work unless he gives the chap some consideration. These ties of consideration which bind father and son should be recognition and money. The father should recognize the son's say or voice in the farm affairs and give him spending money. 'Tis better to have the son raise some crop, a pig or calf and sell it which makes him feel he has earned the money and it gives him an air of independence or self support. Boys can often purchase their own clothes and needs in this way which makes the burden lighter on the parents. Boys sometimes become helpless men because they expect their parents to always help them, not even thinking that they must look out for themselves and cannot always remain on papa's knee.

We do not argue that every boy should remain on the old home farm. There must be some to drift out into the world and do its work, but we do say that there are too many that are turning a cold shoulder to farming, the most noble and hon orable of professions. We often read of some noted jurist, general or public man who has attained fame in some calling, men who have achieved to the highest round of the ladder and stamped their names on the undying tablet of memories, men whose names and good deeds are known to the whole civilized world, to remark with remorse: "Oh, had I only remained on the old home farm how much better 'twould have been." Who can explain this allurment of the old farm home?

May father and sons adopt the Golden Rule as their criterion, conduct their farms on a business-like basis, learn to give and take and there will be little trouble.

DEATH OF THE FARM MORTGAGE

Under circumstances which the German treaty-breakers, the disturbers of the peace, have thrust upon us, there is one thing designed to aid agriculturists to feed our armies and allies, which with the war over, will never be abated, writes James L. Hill in the American Review of Reviews. We raise our eyes and see an angel of benevolence coming down a common country road. It is in the form of an original system of rural credits. The Treasury Department of the United States has inaugurated a Federal Farm Loan Board, which has already loaned to the farmers of the nation more thn $117,000,000. Its outstanding feature is: If a borrower of a large amount pays his interest, he never hears of the debt. Interest at 6½ per cent not only takes care of that item, but it pays off, in less than a generation, all the money borrowed. A farmer at the start requires money for buildings, !machinery and herds. The aching heart of many a widow, bereft of her home by the foreclosure of a mortgage on her property, will see the deep significance in the sacrament that I am seeking to describe. The process is called amortization. The syllable mort, as in mortal, means death of the debt. From the first the mortgage is struck with death.

So happy for all concerned is this method (resembling in its operation a cooperative bank) of obtaning a greatly needed working capital that we may well rejoice with a large class of deserving people, who, for the first time, have the means of doing a larger, more profitable business, wtih the sting and hazard graciously removed. With what bitterness we have all heard the children of the poor recite the anguish that came into the home when the mortgage—like the naked sword, suspended by a single hair, over the head of Damocles—came to do its dreaded office! "But the children began to be sorely weary," says Bunyan, "and they cried out unto Him that loveth Pilgrims, to make the way more comfortable." We have come to see the Government make the way of the children, who inherit a mortgage, more comfortable. All's well! You have had no trouble with the interest. Only go on as you have been going. The farm, the home, are all yours. The mortgage is dead.

N. B. PROVINCIAL POULTRY SHOW

A Provincial Poultry Show held in Fredericton, New Brunswivk, on January 28, 29 and 30 under the auspices of the York County Poultry Association, was an unqualified success, especially in view of the difficulties experienced in staging the show in view of the recent ban on public gatherings, the short time in which the show had to be arranged, etc. The Provincial Show is a substitute for the two local shows held in previous years at Fredericton and Moncton, and its success speaks well for the union of these two exhibitions which has been arranged for an indefinite number of years.

It is extremely unforunate that more desirable conditions cannot be arranged for an exhibition of this size. The building used was most unsuitable in every respect being so small that it was necessary in many places to stage the exhibit three coops high. The lighting features were extremely inadequate and had to be improved as much as possible by artificial lighting which was not at all satisfactory in view of there being two or three tiers of coops. It was also necessary to place two, three and in some cases four, birds in a coop which is large enough for only one in order to show the birds to good advantage.

In spite of the foregoing the entries were greatly in excess of last year, totalling this year 893 birds as against 475 in January of 1918. The 1919 show had an exhibitors list of 57 names whereas at the 1918 show there were only 26 competitors. This year exhibits were received from widely separated points and from practically every section of the Province, quite in contrast with the more restricted districts from which entries were previously expected and received.

The most desirable feature of the exhibition is that the general utility varieties greatly predominated, especially Barred Plymouth Rocks, White Wyandottes and Rhode Island Reds which augers well for the development of the poultry industry in the Province from the commercial point of view. For purpose of contrast it might be mentioned that in 1918 there were 20 Barred Plymouth Rocks on exhibition while this year the total exhibits of the same variety was more than six times that number. The other varieties mentioned also show a substantial increase.

Recognizing the value of utility poultry in the development of the industry in New Brunswick the York County Poultry Association at the recent show put utility birds on practically the same basis as the exhibition ones, that is the same prize money was paid and the same entry fees charged though the classes were more limited only the more desirable varieties being given separate classes. This has resulted in a phenomenal increase in the interest paid to this class of stock which was reflected in the entries received ,there being in 1918 ten birds in all shown in the utility classes by two exhibitors, whereas during the recent show twenty exhibitors competed in the utility classes and showed a total of 150.

The show was featured also by an entirely new idea in the exhibiting of utility Barred Plymouth Rocks by members of Boys and Girls Poultry Clubs formed in various Counties of the Province during 1918 under the direction of the Poultry Division of the Department of Agriculture. These came from distant points and indicates that the youth of the Province is becoming interested in practical poultry culture. No doubt this addition to the regular exhibits will continue to be an increasingly important factor in poultry exhibitions.

The management was most fortunate in securing the services of Mr. Richard Oke, of London, Ont., one of America's most competent poultry judges. Mr. Oke gave perfect satisfaction and his work is most highly spoke nof by the various exhibitors, being an exprienced judge and one whose services are in great demand for all the largest shows he was particularly valuable in that the local exhibitors could learn a great deal regarding the preparation of birds for a Poultry show and the comparative value of their own birds and those of other places where the poultry industry is a more important one and developed to a much higher debree.

In view of the fact that the recent show was undertaken in spite of war time conditions we are justified in assuming that the poltrymen of New Brunswick are wide awake to the importance of their industry and are determined to make poultry raising as a much more important feature of agricultural activity.

Following is a list of the prize winners:

Exhibition B. P. Rocks: Watson Lutz, Moncton, 1st and 2nd cock, 1st hen, 1st 2nd, 3rd, 4th cockerel, 1st, 2nd pullet; Bertrand Goodspeed, Penniac, 3rd cock; John E. Page Fredericton, 2nd and 3rd hen, 3rd, 4th and 5th pullet; Hugh McMonagle, Fredericton, 5th and 6th cockerel; Gordon E. Kitchen, Fredericton, 6th pullet.

White P. Rocks: Henry Simmons, Fredericton, 1st hen; Watson Lutz, 1st cockerel, 1st pullet; Henry Currie, Fredericton, 2nd cockerel, 4th pullet; George F. Lockhart, Fredericton, 3rd pullet, 2nd cockerel; John Oldham, Fredericton, 3rd pullet.

Partridge P. Rocks: Henry Simmons, Fredericton, 1st cock, 1st and 2nd hen; R. P. Allen, Fredericton, 1st cockerel.

White Wyandottes: P. L. Morgan, North Devon, 1st cock, 1st, 2nd 3rd, 4th and 6th hen, 1s tcockerel, 1st, 3rd, 4th, 5th and 6th pullet; Hugh McMonagle, Fredericton, 2nd cock, 5th hen, 3rd cockerel, 2nd pullet; Lloyd B. Johnson, Nashwaaksis, 2nd cockerel.

Buff Wyandottes: W. S. Swetnam, Moncton, 1st cock, 1st, 2nd and 3rd hen, 1st, 2nd and 3rd cockerel, 1st and 2nd pullet; J. Scott, St. John, 2nd cock, 3rd pullet.

Partridge Wyanadottes: R. P. Allen Fredericton, 1st cock, 1st and 2nd hen, and 1st pullet; C. J. Toner, Fredericton, 2nd hen, 2nd cockerel.

Columbian Wyandottes : Cicle Church, Moncton, 1st cick, 1st hen, 1st and 2nd cockerel, 1st and 2nd pullet.

A. O. V Wyandottes: H. C. Jewett, 1st pullet.

S. C. Rhode Island Reds: W. S. Bailey, Fredericton, 1st cock, 1st and 2nd hen, 2nd, 3rd, 5th cockerel, 1st 2nd, 3rd and 6th pullet; Aubrey Stevenson, St. Stephen, 2nd cock, 4th and 5th cockerel; A. D. Gunter, Fredericton, 1st cockerel, 4th and 5th pullet.

A. O. V. Dominique: John P. Rain, St. John, 1st cock, 1st hen.

Buff Orpingtons: J. N. Ferguson, Fredericton, 1st cock, 1st hen, 1st and 2nd pullet; A. Vye Gibson, Moncton, 1st and 3rd cockerel.

Black Orpingtons: H. Gordon Dobson, Moncton, 1st cock, 1st, 2nd and 3rd hen, 1st cockerel, 1st, 2nd and 3rd pullet.

White Orpingtons: Henry Simmons, Fredericton, 1st hen, 1st, cockerel, 1st and 2nd pullet.

Blue Orpingtons: Watson Lutz, Moncton, 1st cock, 2nd hen, 1st cockerel, 2d pullet; Day Bros., Moncton, 1st hen and 1st pullet.

Indian Cornish: John P. Bain, St. John, 1st cock, 1st and 2nd hen, 1st cockerel, 1st pullet.

Indian White Cornish: John P. Bain, St. John, 1st hen.

A. V. Dorkings: Day Bros., Moncton, 1st cock, 2nd hen, 1st pullet; John J. Bain, 1st hen.

Red Caps: John P. Bain, 1st cock, 1st hen, 1st cockerel, 1st pullet.

Light Brahmas: Day Bros., 1st cock, 1st and 3rd hen, 2nd pullet; Charles H. Smythe, Moncton, 2nd and 3rd cock, 2nd hen, 2nd cockerel, 1st pullet; Joseph Ellick, Nashwaaksis, 1st cockerel and 3rd pullet.

Dark Brahmas: Day Bros., 1st and 2nd cock, 1st and 2nd hen, 1st cockerel.

Partridge Cochins: Day Bros., 1st and 2nd cock; 1st and 2nd hen, 1st pullet.

Black Langshans: Charles H. Smythe, Moncton, 1st and 2nd cock, 1st and 2nd hen, 1st and 2nd cockerel, 1st and 2nd pullet.

Europe's Success With Nitrate

European farmers use **600** pounds per acre of fertilizer containing **4½** per cent of **available** Nitrogen.

American farmers, on average, use 200 pounds per acre of fertilizer containing 2 per cent of mostly unavailable Nitrogen.

Average **European yields, Wheat, Oats, Potatoes, and Cotton in Egypt, are double American yields.**

Difference is largely due to amount of **available** Nitrogen applied per acre.

WINTER INJURY IN THE ORCHARD

Last winter will long be remembered by fruit growers in the Provinces of Ontario and Quebec as one of the hardest on fruit trees of any that has been experienced.

While peach trees were killed back to some extent in Niagara Peninsula, it was among the apple trees and in the colder districts where the greatest losses occurred.

The forms the winter injury took were root killing, spliting of the bark at the base of the tree, sometimes known as "collar rot," bark splitting on the trunk, trunk killing, crotch injury and killing back of the top. The fruit and leaf buds on the trees were often killed also. While a large number of trees died during 1918, there were many more which went into this winter in a very weakened condition and may yet die. By the time pruning is begun it should be possible to tell any trees which are going to die this winter or which have additonal dead wood on them, and it will be possible to prune them intelligently. There will be many cases of crotch injury however, where almost all of the bark and cambium were killed around the base of large limbs and where the latter meet at the head of the tree. Trees injured in this way are very unsatisfactory as they may linger for years in a weakened condition and of little value and eventually will break down if they do not die before doing so. The orchard should be gone over carefully this winter and examined for such injury. When pruning the orchard, the dead bark should be removed from these patches and the wounds painted and kept painted with white lead paint. If much of the bark and cambium in the main crotches are dead, the future of the tree should be considered as very doubtful. If many of the trees in the orchard are affected in this way and the trees are wide enough apart to permit of planting a young tree half way between, without too much shading from the older trees it woudl be well to plan to do this next spring. Good crops may be obtained from these injured trees for some years, and, in the meantime, the young trees will be coming into bearing. Where land is available, however, the setting of an orchard elsewhere is desirable. Other trees may be planted successfully where trees were killed last winter, although it has been said that the young trees will not do well where an older tree has been. Sometimes they do not, but it is usually due to the fact that the older trees that were left overshadowed them. Where they have sufficient light they have succeeded.

When replanting where another tree has been, fill the hole with good surface soil from midway between the rows rather than use the same soil as was thrown out. A rapid way of removing old dead trees is by the use of dynamite.

WINTER INJURY.

Varieties of fruit differ much as to their degree of hardiness and by considering this factor at the time of selecting or ordering nursery stock, serious future losses can be avoided. Hardiness of a vareity can only be determined by experience in growing it through a period of years, and local experience should always be consulted as to this point, if a wise choice is to be made. Hardiness, as usually understood, refers to the branches and limbs of trees, shrubs, etc., and also to the flower buds. As some winters are more severe than others, it is these years that actually determine the hardiness of a variety for any section. Trees that are vigorous, healthy and with their wood well matured or ripened in the fall will winter much better than trees that are weak or diseased or with immature wood that has grown late. Protection from the prevailing winds as provided by hills, woods, windbreaks of trees or buildings, will considerably lessen winter injury, as compared to trees in fully erposed positions and is a point that should be fully considered in making a choice of a location, especially in those sections where there may be some doubt as to the hardiness of a fruit.

The flower buds of a tree or shrub may be injured or destroyed without the wood of the plant being injured. This may be due to extreme cold—or a gradually drying out of the buds. Sometimes in mild weather late in the fall, winter or early spring, the flower buds will develop too rapidly, thus increasing the likelihood of injury from later cold spells or dryness. This frequently occurs in the peach, sweet cherry and raspberry, as well as in some flowering shrubs.

Some varieties of fruits bloom much

RENNIE'S SEEDS
Produce Victory Crops

THE Rennie Catalogue for 1919 is brimful of information and suggestions on the growing of flowers and vegetables. Beautifully illustrated in colors, this catalogue is truly valuable as a gardening guide.

It shows you the practical results obtained by planting tested seeds, and it proves to you the best kind of seeds to buy.

Use the Rennie Catalogue as a Ready Reference

Make your selection of seeds from it—then go to your dealer and have him fill the order. If he cannot supply you with all you require write us direct.

To safeguard our customers all Rennie's Seeds are tested at our trial ground. This insures that buyers of Rennie's Seeds get nothing but the very best.

If you haven't received a copy of our 1919 Catalogue, write for one to-day.

earlier than others and frequently there is as much as two weeks difference between the blooming dates of an early-blooming and late-blooming apple tree. The flower buds when fully opened are very susceptible to injury by frost and frost may considerably reduce or totally destroy a crop of fruit. In many places in the Western States, it has become necessary to practice orchard heating during the blossoming period in order to prevent or lessen the damage from late frosts which occur so frequently. In sections where late frosts are the rule, late-blooming varieties would be more likely to escape injury than early-blooming varieties.

Hardiness may also be considered from the standpoint of the roots of the plant. Injury here may be attributed to deep freezing, alternate freezing and thawing, wet soil and shallow soils, which do not allow the plants to root deeply. Precautions that would greatly lessen root injury would be planting on a deep, well-drained, carefully- prepared soil and by mulching or giving some protection to the ground. The mulch may consist of a cover crop sown for the purpose, or grass, or it may be a covering of straw or strawy manure or boughs from evergreen trees or leaves. Snow makes a good covering and keeps the frost out remarkably well, but it cannot be depended upon for thorough protection.

Hardiness is a matter of degree, some varieties being hardier than others and naturally better suited to colder sections. Local experience is most valuable in determining hardiness for any section and when possible, should be consulted before definitely deciding on the varieties that are to be planted.—T. G. B.

SPRAY FOR APHIDS OR LICE ON PLANTS

What remedy can I use for my plants that are covered with black flies, and there is also white worms in the soil? I have a shamrock plant that is also covered with white insects on underside of leaves. J. C.

Reply: These aphids are often call-plant lice. They do not bite off and chew their food, as some of the crop pests do, but suck juices from the tender growing plants. For this reason it is not possible to poison these pests with the ordinary solution, as there would be no way of getting the solution into the stomach. The way to kill plant lice is to spray with a contact solution such as kerosene emulsion, tobacco extracts, etc.

Kerosene emulsion is made up in stock solution according to the following formula:

Kerosene, 2 gallons; fish-oil or laundry soap, 1½ pounds; water, 1 gallon.

The name "fish-oil soap" is now used in place of "whale-oil soap," since most of the soap on the market is made of fish oil.

First the soap should be dissolved in a gallon of boiling water, and after the vessel is removed from the fire the coal oil should be added. Then the mixture should be agitated thoroughly for four or five minutes by pumping the liquid back nto itself until it becomes a creamy mass and the oil does not separate. The quantities of the ingredients may be increased when a larger quantity of spray is needed. This stock solution is used against aphids at the rate of one gallon to seven or eight of water.

For the worms, slake some quicklime in water and the lime to precipitate to the bottom then pour off the clear water on top and use in giving the plants. One or two doses, or more, at frequent intervals of a few days is necessary for a cure.

USE FOR SCALLION ONIONS

The thick-necked, or scallion onions, which are sometimes produced in large quantities, are not considered valuable by commercial growers, who usually leave them on the field to be plowed under. George Hough of Jefferson county, Pa., had an unusually large percentage of scallions, and tried a new method to use them.

Late in the fall, but before they were injured by freezing, they were pulled and set in deep trenches, much as celery is trenched, and left over winter. In the spring, when the stems started to grow, they were pulled for use as bunch onions, and were found to be very sweet and tender. They sold quickly at 5 cents a bunch, and Mr. Hough said he could have disposed of a carload if he only had them.

Massey-Harris

A Perfect Seed Bed

MASSEY-HARRIS CULTIVATORS and other Tillage Implements will put your land in the best possible shape for seeding and with a minimum expenditure of time and labor.

Much of the success of your crop depends on the condition of the land at seeding time, therefore it is well worth your while to see that the work of preparing the soil is done in the most thorough manner.

Be your farm large or small, we can supply you with the implements just suited to the requirements, from the smallest One-Horse Machines, to the large Tractor-drawn Implements and the Tractor to furnish the power.

DAIRYING.

HARVESTING ICE PAYS DIVIDENDS

Five dolars profit per cow annually, by providing ice for thorough cream cooling, can be realized by farmers in the natural ice section of the country. There usually is a period of leisure in the winter time when any farmer can arrange to take advantage of this paying investment. It is estimated that the provision of 1,000 pounds of ice per cow is sufficient to cool the cream during the year besides furnishing ice for other incidental purposes about the home.

A fifteen cow dairy would require about eight tons ice costing about one dollar per ton to harvest. The proper use of this ice in producing higher quality cream, for which the creamery will pay a premium, will add practically $85 to the annual income from fifteen average cows, or $5 net for each cow.

Ice HelpsQuality

The immediate cooling of cream to 50° F. or less will keep it sweet usually a day longer than cream not sufficiently cooled. If cold spring water be abundant very little ice will be required. Usually in the hotter part of the season the supply of spring water may become so diminished that its temperature rises to such a point that proper cooling can not be acccomplished without the aid of ice.

Quality is the watchword of the progressive creamery. So keenly do the creameries appreciate quality of their raw product that they are willing to pay from three to five cents per pound more for the butterfat in clean sweet cream than they will offer for sour cream fat. They will pay this difference because they are able to get more on the market for the product made from well cared for cream.

Good quality sweet cream makes a high scoring and fancy piece of butter. Butter is now sold according to its score. The higher the score the better is the price. The more the creamery can get for its butter the more it is able to return to the producer for his butterfat. It follows that if the creamery is to pay good prices, it is necessary for the patrons of that creamery to deliver the highest quality cream.

Ice Means Fewer Deliveries

Many farmers who do not have cold springs or ice on their farms are obliged to deliver their cream daily in warm weather in order to have their cream sweet and thus command the premium price. By proper cooling in clean, scalded utensils to at least 50° F. this same producer could keep his cream sweet long enough that only three, instead of six weekly deliveries would turn the trick. A little ice for thirough cooling in this way saves several hours of valuable time needlessly spent taking the cream to the creamery when the time can be more profitably spent about the farm in the busy growing and harvesting seasons.

High Prices Demand Quality

As prices advance the trade becomes more particular about the qpality of the goods. It therefore is the producer's problem to do his bit in maintaining high prices by supplying only the very best raw product which is the prime essential in the manufacture if a fancy article for which there is ever a good demand.

By observing absolute cleanliness about the dairy equipment and personne, by keeping profitable cows, and especiall by thoroughly cooling each batch of cream, is the producer really doing his duty in making possible the supply of the best dairy goods to an appreciateive demand.

A little ice house, some sawdust or hay, a few loads of nature's ice, and the progressive dairyman has made an investment that gives his community a reputation and his pocket book a paid tax receipt.—A. D. Lynch in Hoard's Dairyman.

MANURIAL VALUES OF DAIRY FEEDS

When feeding dairy cattle, and especially if purchasing high priced concentrates, it is well to consider the fertilizing value as well as the feeding value of feeds. Just as the value of a commercial fertilizer depends on the amount of available nitrogen, phosphoric acid, an dpotash it contains, so, to a large extent, does the value of manure depend upon the amounts of nitrogen, phosphoric acid, and potassium contained in the feed consumed by the animals. Those feeds which contain relatively large amounts of the three important plant foods make good manures and those which contain small amounts make poor manures.

The following tabulation shows the equivalents of nitrate of soda, 16 per cent .acid phosphate, and muriate of potash contained in some of the common dry feeds. The amounts of nitrogen, phosphoric acid, and potash contained in these feeds were taken from Henry & Morrison's "Feeds and Feeding," appendix, Table III. The nitrogen was then calculated as nitrate of soda, the phosphate, and the potassium as muriate of potash because these are the more common forms in which these constituents are found in commercial fertilizers.

One ton of cottonseed meal contains alent of 196 lbs. of nitrate of soda, 92 lbs. of 16 per cent. acid phosphate, and 12 lbs. of muriate of potash.

One ton of oats contains the equivalent of 240 pounds of nitrate of soda, 108 lbs. of 16 per cent. acid phosphate, and 18 lbs. of muriiate of potash.

One ton of bran contains the equivalent of 310 lbs. of nitrate of soda, 394 lbs. of 16 per cent. acid phosphate, and 52 lbs. of muriate of pitash.

One ton of oil meal contains the equivalent of 716 lbs. of nitrate of soda, 236 lbs. of 16 per cent, acid phosphate, and 40 lbs. of muriate of potash.

One to nof cottonseed meal contains the equivalent of 774 lbs. of nitrate of soda, 354 lbs. of 16 per cent. acid phosphate, and 56 lbs. of muriate of potash.

CARBONOL

A Blessing in the Home

IF there is one thing needed around the home or farm, it is Carbonol. Good in a hundred different ways. Helps house cleaning. A few drops in a pail of water makes a bucket of antiseptic, grease-killing liquid. In solution, it is wonderful for cuts on yourself or your live stock. Drives away flies, disinfects the sick room, makes barns, stables and henneries sanitary. You should not be without it. Get some now. In bottles.

There is a dealer in your neighborhood who sells these and other Barrett products. If you don't know him write us direct for prices and particulars.

THE BARRETT CO., Limited

St. John, N.B. Halifax, N.S. Sydney, N.S. 13

The Greatest Hour of the Dairy Farmer

NOW that the war is over, the farmer's responsibility and opportunity are greater than ever—for the North American farmer and dairyman must literally feed the world. It means greater production and getting the *most* out of that production. Waste is as unpatriotic now as it was during the war.

But there is many a farmer who would not think of planting a hundred rows of corn and only harvesting 95 rows, who is now using a fixed feed separator and wasting a good part of his butterfat through turning under speed. Even tho the proper separating speed is marked on the handle, tests show that 95 per cent of *all* separators are turned below speed. If you turn a Sharples Suction-feed Separator below speed, you skim clean just the same—due to the patented suction feed. No other separator has this principle.

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

"Skims Clean at Any Speed"

Sharples is the pioneer North American Separator—invented, perfected and preferred in North America. It is the product of the greatest factory of its kind in North America. Write for the interesting, profitable Sharples story and Sharples Book of Old Songs. It's free. Address nearest office, Dept. 79

For
Dairy Utensils
use
Old
Dutch
Cleanser

It cleans quickly and thoroughly. It is better and more economical than soap or any other cleansing material. Use Old Dutch for cleaning everything throughout the house—it lightens labor.

One ton of clover hay contains the equivalent of 288 lbs. of nitrate of soda, 52 lbs. of 16 per cent acid phosphate, 52 lbs. of muriate of potash.

One ton ol alfalfa hay contains the equivalen tof .288 lbs. of nitrate of soda, 72 lbs. of 16 per cent. acid phosphate, 70 lbs. of muriate of potash.

Figuring the Manurial Value of Feeds

Calculating the manurial value of these feeds at the present high prices of fertlizers (nitrate of soda 5 cents a pound ,acid phosphate 1.2 cents a pound, and muriate of potash 25 cents a pound) corn would have a manurial value of $13.90 per ton; oat, $17.80 per ton; bran, $33.23 per ton; oil meal, $48.63 per ton; cottonseed meal, $56.95 per ton; clover hay, $26.02 per ton; and alfalfa hay, $32.76 per ton. Although one would not be justified in buying nitrogen and potash in commercial fertilizers at the present prices, the above figures show the comparative value of these feeds as fertilizers, and should be useful in determining the relative values of the different feeds. As a rule, however, it is not necessary to add nitrogen to the soil, if legumes are grown in rotation with other crops.

Manure Should Be Carefully Saved

One must remember that not all the fertilizing constituents in a feed are recovered in the manure. Averaging the results obtained at the Ohio Experiment Station and those reported in Henry & Morrison's "Feeds and Feeding," we find that approximately 75 per cent. of the nitrogen, 80 per cent. of the phosphoric acid, 80 per cent. of the potash in the feed consumed by a dairy cow are recovered in the manure. n aIddition to the constituents which are lost in the process of digestion, much may be lost fterward. Much of the waste manurial value through the loss of urine, by leaching and by fermentation, may be prevented by hauling the manure directly from th estables and spreading it on the fields. When this is not practicable the manure should be kept under cover and compacted by allowing the animals to run over it.—R. I. Grady, in, Ohio Experiment Station Monthly Bulletin.

Iowa College of Agriculture.

ABORTION

Please tell me how to rid my herd of contagious abortion.—G. H. M.

There is no specific remedy for contagious abortion disease, but it may disappear in time if you have each affected cow properly disinfected by a competent vetreinarian and then disinfect the vagina of each cow and heifer every other day for two or three weeks before breeding. Also have the stable cleansed, disinfected, and whitewashed under supervision of the veterinarian who also should supervise the disinfection of the cows and bull. He nod doubt has a favorite disinfecting solution, but it may be suggested that normal salt solution or a similar solution of hypochlorite of soda is useful for vaginal and uterine cleansing and a solution of permanganate of potash or Lobell's solution of iodine.

COW WITH STRINGY MILK

We have a good cow which gives apparently good milk, but when we separate this milk, there is left in the separator a little slimy sticky substance. Otherwise the cow appears in good health, is out on grass and getting good clean well water.—W. H. W.

Ans.—Your inquiry re cow giving milk, but after running same through separator you can detect a slimy, sticky substance, which may be caused by the cow being nearly due to calve, or, if not, she may be suffering with chronic mammitis, and would advise giving her the following: Half ounce formalin in 2 ounces raw linseed oil; to be followed by dram doses of formalin in same quantity of oil for 2 or 3 days.

OBSTRUCTED TEAT

I have a very valuable heifer which has developed a bunch in the end of one teat. It started with a small sore which seemed to spread and got to be about as big as a five-cent piece. It kept getting harder to milk; now I use a milking tube. The sore has healed up, but the bunch is there. It does not seem to be hard! the stoppage is about three-eihgts of an inch from tip. The sore was not right at end, but a little to one side. I have used iodine on it, but it still choked up. Will you tell me what to do.—F. W. T.

The milking tube has already introduced infective matter and its continued use will be likely to cause ruinous garget. Have the growth reamed out by a skilled surgeon, or he may prefer to slit down through it in four different directions by means of a teat bistoury. Treatment other than thi swill not be likely to succeed. Meanwhile immerse the teat for a minute or two twice daily in a hot saturate dsolution of boric acid.

Mare has habit of cribbing when standing in the stall. Is there any cure for it?

Reply.—Cribbing or wind sucking is a vice, not a disease, and cannot be cured by medicine. Applying a mixture of red pepper and soft soap, or better still, aloes, around the stall, will sometimes stop the hobit. It is largely hereditary and anmials with this tendency should not be bred.

Sooner or later you will buy a

DE LAVAL
CREAM SEPARATOR

If you have any use for a cream separator, it's only a question of time before you buy a De Laval.

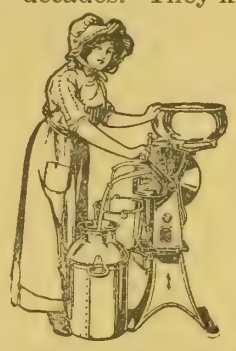
Many buy a De Laval to start with and so avoid a lot of "separator grief."

Others buy one, two or three different machines before they finally learn by experience that "the best is the cheapest" and get a De Laval.

That's why, in the older dairy sections where separators have been in general use for many years, you'll find most of the machines are De Lavals.

"Claims" don't mean much to such farmers. They've had lots of separator experience. "Performance" means a thousand times more to them than claims.

They've watched the De Laval "perform" for several decades. They know that it is reliable and they stick to it, just as does the creameryman who is also "separator wise."



Why not be guided by the experience of these men and buy your De Laval "Sooner" instead of "Later?"

Order your DeLaval now and let it begin saving cream for you right away. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below

"LADY JANE" DEAD

A NOTED AYRSHIRE COW.

Canada's most noted Ayrshire cow "Lady Jane"—30886, died from pneumonia a few days after freshening on November 28th, last, as a result both her owners, Messrs A. S. Turner & Son, Ryckman's Corner, Ont., and the Ayrshire breed have suffered a great lass. She had just freshened after her fourth R. O. P. test with 19,135 lbs. milk and 704 lbs. butter fat, made in 353 days. By this test she wins, for the second time, the Silver Cup given by the Ayrshire Association for the highest score in 1918, making 21285 points, being 4787 points, (of 29%) over her nearest competitor.

She also holds the highest Canadian Official Record with 19,405 lbs. milk and 786 lbs. fat.

Lady Jane was a wonderful cow and possessed the power of assimilating food to manufacture milk to a marvellous degree.

In a four year's cumulative test she gave 64,889 lbs. milk and 2506 lbs. butter fat. Ter total days in milk during this cumulative test were 1218, therefore she gave an average of 53 lbs. of milk and a little over 2 lbs. of butter fat per day, a cumulative record seldom equalled. While Lady Jane was making this cumulative record she was taken to four Dairy Tests and made the highest Ayrshire score at each of them.

At the Guelph Dairy Test in 1917 she produced 250 lbs. of milk and 8.64 lbs. butter fat in 72 hours, making a score of 282.7 points, winning over all registered cows. This is the highest score ever made by an Ayrshire in a public test.

Lady Jane contained the blood of several noted sires,—Kitchener, White Prince (Imp), Comrade of Garlaff, (Imp), a son of the great "Blood-for-ever of Wynholm" in Scotland. On the dam's side she traces to the celebrated Gurta family and to the noted bull "Hamilton Chief", which sire also influenced the Jean Armour family. Thus good blood tells in production as well as in type, a combination which made Lady Jane famous.

A PROGRESSIVE MOVEMENT

Editor the Maritime Farmer:

It is the purpose of the Department of Agriculture at Moncton to conduct a series of meetings (a copy of the programme of which I am enclosing) throughout the months of February, March and April, which will be of general interest to the farmers in the surrounding districts.

The addresses will be given on Saturday afternoon on the second floor of the Farmers' Co-Operative Creamery Co. Building at 2 O'CLOCK SHARP and will last one hour, after which a general discussion will take place on the subject taken up for that particular day. It is particularly requested that an endeavor be made to be in the lecture room on time, as much is missed through coming late—however, better late than not at all.

I can assure every one who attends with the desire to learn that he will not go away from a single meeting disappointed. Every endeavor will be made to get the best possible men available to deal with the various subjects to be discussed and if the farmers will co-operate with the Department and do their part by attending, encouraging others to come and manifesting interest in the addresses given, they can rest assured the Department will see to it that the best men available in the Province and elsewhere are engaged.

If the general attendance and interest displayed this year are good, this work will not only be continued another year, commencing earlier in the season, but in all probability a short course can be arranged for in Moncton next year.

It will be noticed in the programme that the name of the subject is not indicated in three places. The subjects for those days will be selected at the meeting held the previous week.

Every farmer and any interested member of his family are cordially invited to be present at as many meetings as it is possible to attend, and feeling as the Department does that no one will receive a greater benefit than the interested young man or boy on the farm a special invitation is extended to him to attend. A special invitation is extended as well, to the ladies to be in attendance to hear the address on "Poulry."

J. H. KING,
Agricultural Rep. for West'd.
Albert and Kent.

Does *all* the Seed-Bed Work

In the important work of preparing the seed-bed, the Cleveland Tractor *does more than merely plow.*

Any tractor will plow.

But the Cleveland because of its track-laying construction travels *on top* of the soft plowed ground with harrow, seeder or other implements.

It does its work rapidly and economically *under conditions most difficult for the ordinary machine.*

The Cleveland, with its tremendous traction surface, *rides on top* of the ground like battle tanks--*without wallowing, sinking in or packing down the soil.*

The Cleveland uses its power *to pull the implement*—not to pull *itself* out of the ground. That is one reason why it operates on so little fuel.

The Cleveland will pull a roller over your young wheat *without injuring the crop.*

It does the hauling, the manure spreading, the ensilage cutting, the stationary engine work and the hundred and one *other* things that every farmer expects a tractor to do.

And it does the work *better,* as well as faster than before.

Orders for spring delivery should be placed *now.* Write for booklet and name of nearest Cleveland dealer

EUROPE WANTS MEAT

Canada now has the opportunity to make her export position permanent

The war stimulated the export trade in Canadian live stock products to a degree deemed well nigh impossible five years ago. Exports of beef increased 6795%. of bacon and pork products 571%. Total exports of live stock products in the fiscal year ending March 31st, 1918, were valued at $172,743,081 as compared to $53,349,118 in 1914.

Canada has the opportunity of holding this trade and increasing it, for our meat products won a splendid reputation in Europe during the war, and Canada is in the position of the favored nation.

The price of feed has been high, and the cost of producing live stock has been correspondingly high. But the market price of finished animals has also been high. The price may decline gradually, but the price of feed will decline also, and the percentage of profit to the farmer should thus remain about the same. Indeed if the cost of feed declines first, the profit to the farmer will be increased.

J. E. Brethour, of Burford, Ont., who won the first prize for export bacon hogs at the Winter Fair at Guelph, says that with the relative prices of feed and bacon then pertaining there was a good profit.

"With standard feed at $57 a ton and hogs at $16, live weight, I make a profit of over 20%," said Mr. Brethour. "It is profit that counts not the selling price, and profit depends upon the relations of the price of feed to the market price of the finished animal."

Mr. Herbert Hoover, Chief of the United States Food Administration, who is at present in Europe investigating conditions at first hand, cables as follows:

"Every pound of pork products we can export before next July Europe will need, and as soon as the initial chaos of the sudden economic change from war to armistice can be overcome there will be over-demands."

Authorities say that this demand in the case of beef, even more than that of pork, will be abnormal for many years owing to the fact that Europe is estimated to be short of over 115,000,000 head of live stock, of which 28,000,000 represent cattle irreplacable in less than five years.

25% MORE MILK with SILAGE

RIGHT NOW if you had a silo you would not only be getting 25% more milk, but you would be spending a great deal less for feed. With cream and milk at present prices, you must appreciate your need of a good silo more than ever, because there never was a time when good cows, properly fed, would return to their owner as great a profit as they do today.

RIGHT NOW is the time when an Ideal Green Feed Silo, filled with rich, juicy, milk-producing silage, would save your worrying about feeding so much high-priced grain and would be putting more milk in the pail every day.

RIGHT NOW is the time to prepare for bigger profits from your cows next winter. Our silo catalogue, which we will gladly send on request, contains a great deal of valuable information about silage and explains why the Ideal Green Feed Silo is the best to buy.

Write today for this catalogue.

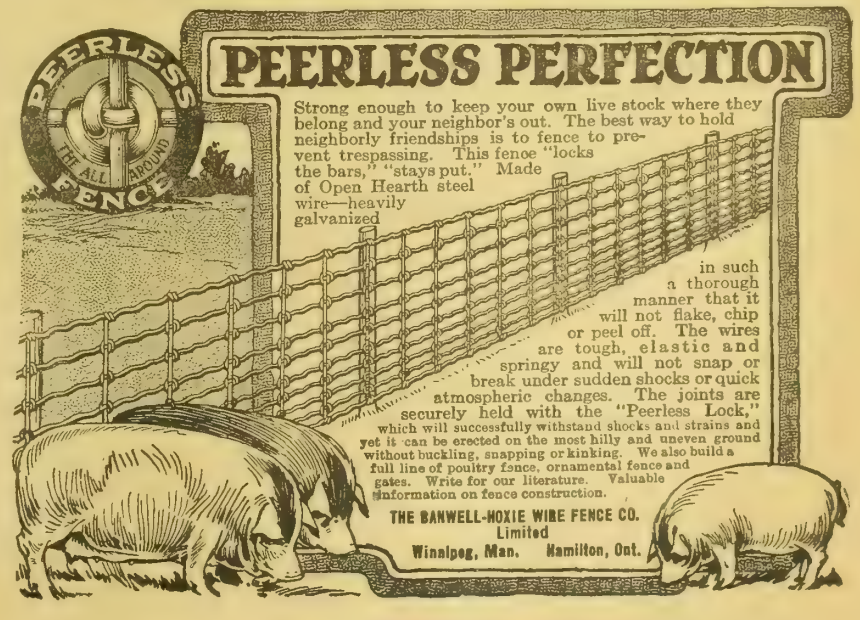
REMOVING TUSKS FROM A BOAR

A reader gives a practical method of removing tusks from a boar, as follows:—"He prefers tying up by the upper jaw and putting a slip knot back of the upper tusks. The hog will pull back and keep the rope tight; one man stands astride the hog and puts a hardwood stick about one-fourth inches thick in the boar's mouth; takes hold of both ends, pulls it back as far as he can and holds it there. Another man should then put some straw on the ground, get down on his knees, and, with a three-corner-ed file, file a good notch in each corner of the tusk; then put the point of an iron wedge in one of the notches and tap it with a hammer, when the tusk will break squarely off. He would then, with a flat file, smooth the stump down to the jaw. He thinks if this procedure is folowed the hog will give thanks and say: 'You have done a good job and it did not hurt very much.' "



PEERLESS
FENCE
PEERLESS PERFECTION
Strong enough to keep your own live stock where they belong and your neighbor's out. The best way to hold neighborly friendships is to fence to prevent trespassing. This fence "locks the bars," "stays put." Made of Open Hearth steel wire—heavily galvanized
in such a thorough manner that it will not flake, chip or peel off. The wires are tough, elastic and springy and will not snap or break under sudden shocks or quick atmospheric changes. The joints are securely held with the "Peerless Lock," which will successfully withstand shocks and strains and yet it can be erected on the most hilly and uneven ground without buckling, snapping or kinking. We also build a full line of poultry fence, ornamental fence and gates. Write for our literature. Valuable information on fence construction.

Winnipeg, Man. Hamilton, Ont.

THE HORSE

MANY OF THE VICES SEEN IN HORSES ARE MAN-MADE WHILE TRAINING THE COLT

A horse without spirit, courage, and fearlessnss is practically no horse at all. These attributes in a hors are indispensable, and it is to promote those that the colt must be handled at an early age and handled in a manner that will best promote his cultivation in the growing organism. The work of selecting, breeding and feeding genrally covers the duties that lie to the hand of the suicessful man with the cattle, but not so that of the horse breder and caretaker. The horseman has a wider field to overtake.

The managemnt of horses require the caretaker to be a student of their natural temperaments and high spritedness. These characteristics in the horse have to be fed, nurtured and trained for future usefulness, and are as necessary to the value of the horse as his other qualities so often heralded as making up the great good horse, viz: that of substance, conformation, and quality. Only when these are found in unison with a fearless and courageous spirit will they amount to the full fruition of horse breeding and horse rearing management.

The Colts First Lesson

Now watch the little colt after he is a few days old. His natural abilities for speed are evident, it is given him by nature so that he can outdistance his dam in the general stampede from natural enemies in the wild state, and thus keep the mother between him and pursuing danger. In a box stall or field though the mother is not afraid of the human intruder, the little fellow will keep the mother between him and you. His first lesson in condence must be given right here. He must be coaxed to let you handle him quietly, but fooling with him even at this tender age will often lay the foundation of a vicious habit. Talk kindly, pat him or rub his nose or anything that will indicate to him kindness and sympathy, but do not teach him to be tricky or cheat him. Whatever you do, do it, and then leave him alone. He will gradually take to your visits and look for you return.

The first lesons given to the colt to encourage his confidence can be done without wasting valuable time from any other work. On most farms the dam wil lhave duties to perform and while giivng her the attention necessary to the fulfillment of her work the handling of the colt also becomes necessary and much depends on this early attention. Where the dam is not worked while nursing her colts the colt in this case should be left severely alone i nthe early stages. It is the colt whose mother has to take her place in the team that the teamster has to watch how he behaves towards it, for the majority of vices in horses are generated at this early stage. and with the colt whose mother had to work, being spoiled in the early management. There are only two ways, either leave them severely alone till weaning or handle them with sense while nursing, and it is the colt with the working mother that too often gets the fool handling.

Haltering at an Early Age

Longe before the colt is weaned he should be haltered. The haltering should be done without roughness; but when you get a hold keep a hold. Do it beside his mother; have a leather halter the size, one that is well oiled and can be adjusted to the size when once it is fixed on his head. There are two very tender spots in all horses, old and young, and in the little sensitive cout they are doubly tender. They are the top of the head and fetlock joint. Just press on the top of the skull between the ears of any horse, or touch the fetlock joint with the toe of your boot, and you will soon find this verified.

Besides being otherwise afraid, these are the two spots in his anatomy that the young colt knows as his tender ones, and he readily defends them. If he is hurt in these the haltering becomes an ordeal that he never will forget. Often in the scramble the feet of the man strikes the fetlock of the colt while the hand has caught or is near the top of the head, and haltering bcomes impossible. It is advisable to do the operation alone, but if you lack experience get one to help you and while you catch him under the neck with one arm and around the buttock with another get the help, who has slung the halter on his left arm, to catch the nose and draw the halter from the arm over his head and fix it. When let free do not try to hold him till he becomes accustomed to your handling. Leave his mother in the box stall while you take him out; treat him well and give him some toothsome tit bit while you are alone with him. Follow his inclinations at the start, run with him when he wants to and stand with him when he so inclines. Do not try to teach him anything until he begins to show signs of docility and attention.

At this stage it is wise to leave the halter on his head, if it is a close fit and does not hurt or is not loose so that it will catch in anything. You will require to examine it very often for the head of the colt grows very rapidly at this stage, and will overgrow the size of the halter with serious results.

Instilling Vices in the Colt

Do not make the mistake of trying to teach the colt too much at one time; he should understand each lesson thoroughly before a second is attempted. Be gentle and firm at all times and go through with whatever is attempted.

When properly handled the colt will take a delight in his lessons and readily to the exercise as a break in the many lonely hours he has to spend alone in the box stall away from his mother. If you have proven yourself a favorite with the colt he will come to you when in the field with his mother, and at any time you do not feel inclined, or have not the time, do not "shoo" him away or seek to frighten him by throwing something at him. That, to the colt is another lesson, and he may never again seek your company He also has become aware of a new way of escape, and when next you want to get him he will use the same means of escape and run away from you. Many a horse has been spoiled for life by this mistake.

Never use a rope at the halter in which there is danger that it will break, or the idea of getting away will be further intensified in the colt.

It is wise also never to try the strength of a rope. Abetter policy is to follow the colt quite a bit in the early stages. It is not necessary to drag a colt by the halter in order to suggest to him that his business is to follow. You may not get him to follow by this means, and then another lesson has been taught him, viz., the power of resistance. There is also

Horsemen Attention !

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

danger of his rearing and falling, affecting the back; string-halts, stifles, weak back are the results, acompanied with sullen dispositions. The colt will also discover where you are weak and he is strong; he will know how to shoulder the rope, adjust his nose or mouth to the halter or bit—and can pull you all over the place. There should really be no breaking of a colt; the whole process is a gradual education largely balanced by a sympathetic feeling for the young animal. No amount of breaking will cure a horse that has been spoiled, either by neglect or by puerile attempts at training, and they are the horses that have to be closely watched while in harness. Many of the vices that deteriorate so much to the value of the horse, are man-made, and it is during the early training that these vices are generated.

STALLION OUT OF SORTS

Editor.—I have a stallion, weight about 2,000 lbs., that had influenza last summer, and seems to stock up in the hind legs ever since. Sems constipated unless fed on soft feed all the time. Am feeding 4 lb. oat chop, 2 lbs. bran, handful oil meal with a little Glouber salts twice a day, with all the hay that he will eat, yet it does not physic him, although in addition he gets reasonable exercise each day.

1. Is saltpetre injurious to a stallion in breeding season?

2. Should this horse have a tonic or blood purifier? He is thin, but seems to feel good.—Stallion owner.

Reply.—The after effect of influenza, especially on a stallion, seems to be always of long duration. Would advise to feed the horse warm bran mashes for 24 hours (no hay and very little water), and give as a drench, on an empty stomach, 1½ pint sof raw linseed oil with ½ ounce of spirits of turpentine, (not oil of turpentine). Repeat th edose about 12 hours after first. Then, after second dose, start giving him a little hay, and increase every meal, until he gets his regular portion of hay. From the time you give first dose of oil, he should have luke warm water to drink. After a few days would suggest to feed boiled oats with some bran, starting light and increase every day. In portion of boiled oats, would give a teaspoon of liquor arsenicales twice a day. Two hours of slow, out-door exercise would be O. K.

2. Saltpetre is not advisable to give a stalloin in breeding season.

3. Yes, a tonic, prepared according to thecondition of your horse would be fine.

LEUCORRHOEA

Will you kindly publish in your next issue a remedy for the followin?

Last summer a four-year-old mare foaled a week too soon; found her in the pasture with the foal sticking half out of her, dead. Since then she had a bad discharge, as though something was torn in her; was advised by a stallion owner to inject alum water into her, which I did, and which seemed to help her for a time, but now she is much worse again. Mare is also run down and in poor spirits, though not as poorly as one might imagine.—G. H. M.

Reply.—This is a case of leucorrhoea (whites), in most cases caused by retained afterbirth. Wash out the womb with a 2% solution of creolin, once a day for a week, then twice a week for a few weeks, and again give a tonic as follows: arsenic trionide, 1 dram; powdered nux vomica, 3 drams; powdered ferri sulph., 4 ounces; powdered gentain, 3 ounces. Give tablespoonful twice daily in feed.

NECROBACILLOSIS

Will you please advise me through your Veterinary Department what I should do with a mare that has a very bad foot rot? I have been washing and poulticing, using bluestone on same with little results. It broke out last fall.—Subscriber.

Reply.—If ycur mare is suffering with necrobacillosis, or foot rot, which is due to a filth germ called Bacillus Necrophorus, we would recommend cleansing parts thoroughly with an antiseptic solution of creolin, then remove all diseased tissues and causterize the wounds with an application of pure carbolic acid; repeat twice a week until the wounds are healthy. Do not poultice. If the infection extends to the inside of the hoof, would then suggest for you to call a veterinary.

Pratts Horses Work Better
when kept in prime condition with the proper kind of diet. A tablespoonful of
Pratts Animal Regulator
mixed with the feed, sharpens the appetite, improves digestion, keeps the blood cool, bowels regular, coat glossy, health and vigor at top notch all the time. Horses get more nourishment out of their feed. You get more work out of your horses.
Give "Pratts" to all your horses, cows, hogs and sheep, and watch the results.

REMEDIES FOR WORMS IN HORSE

Could you let me know of some cure for worms in my horse? They are about one-sixth of an inch thick.—J. S.

Reply.—Mix together two parts of common salt and one part each of sulphur and dried sulphate of iron (copperas), and of this mix one tablespoonful in a dampened night and morning for a week, then stop for 10 days, and then give the powders for another week. The medicine kills the worms nad they are digested in the intestines so do not look for them in the feces. As pinworms inhabit the rectum and are not destroyed by internal remedies it would be well to give rectal injections on three successive evenings. Use two or three quarts soapy, warm water containing tobacco stems or leaves in boiling water, allowing to stanad covered for twelve hours and straining before use. A decoction of four ounces of quassia chips to the gallon of boiling water also is excellent for this purpose.

DOES THE HORSE LIE DOWN?

One occasionally sees the statement that horses seldom, if ever, lie down. That there are horses whose caretkers have never seen them resting in that way we do not question, because we have heard it from stablemen who have carefully observed them. But no one who knows anything about horses and who has seen them stretched out at full length in pastuses and in their stalls, and who has noticed unmistakable evidences on the horses themselves in the morning of having lain down, will credit the asertion. Many a horse is doubtless too sensible to lie down on a rough, filthy, unbedded floor, but give him a comfortable, well-bedded stall, and not only will he lie down but repay his owner with better service and more years of usfulness because of the more perfect rest thus obtained.

Harness Must Be Dependable
Harness that breaks under strain is a risk to life and limb and besides, it takes time and money to repair it. Get Harness that is "dependable," that holds together and keeps in fine condition under all reasonable circumstances. IMPERIAL BRAND HARNESS is guaranteed free from defect in material or workmanship. We have been in the harness business *for 52 years* and our goods have always given unqualified satisfaction. Your dealer sells it; if he doesn't, write direct to us—we can supply you promptly. We are manufacturers and can offer a big assortment at attractive prices. Express delivery charges paid at our end.
Special Offer
Our "Buggy Special," No. 104, is a big seller. It is thoroughly STRONG, HIGH GRADE AND FINE LOOKING. We particularize on this and have put extra value into it. Select leather of good weight. Single strap Breast Collar, raised layers; strong Traces; Breeching has side, back and hip straps; Saddle has patent leather skirts and jockeys, padded, leather linings and flexible tree and 1 in. swinging shaft bearers; Lines 1 in. with russet hand parts; Trimmings heavily nickeled. Solid Nickel, $2. extra. Genuine hard rubber $4, extra. Express prepaid to any station on receipt of price. Guaranteed satisfactory or goods may be returned. Order now. $28

POULTRY.

FEEDING FOR WINTER EGG PRODUCTION

High winter egg production is dependent to a large extent upon the methods of feeding the birds and the foods fed. It is usless to feed heavily on a grain ration if the other essentials of a suitable diet are not provided, and this is probably the most serious error our farmers and poultry raisers make in their winter feeding of their laying stock. There is, however, little danger of over-feeding if a variety of foods of the proper kind are given and the birds are compelled to take sufficietn exercise.

The short working day is in large part responsible for the usual low winter production because of the inability of the bird to eat a sufficient amount of feed to produce the maximum number of eggs of which she is otherwise capable. It therefore behooves the poultryman to overcome the difficulty as much as possible by feeding as early in the morning as light will permit, feeding liberally during the day and making sure the birds crop is full at roosting time. Many poultry experiment statons have demonstrated that poultry houses for several hours in the morning and again in the evennig may be lighted artificially and the birds make to pay the costs and give a good profit in addition. The increased egg production is not directly due to any magic effect of artificial light, but to increased food consumption made possible through its use. The idea is in general use among large poultry raisers in many places and even farmers and other small raisers are utilizing the discovery. An ordinary lantern will answer the purpose in a small pen.

Grains

Poultry can use to advantage a variety of grains. Wheat is probably the most useful and satisfactory all round grain food, but a mixture of wheat with at least one or two other grains is more satisfactory. For winter use cracked corn is excellent and buckwheat may be used when the birds become accustomed to its appearance and eat it readily. Oats ar one of the best of grain foods if they are of good quality. Oat hulls have about the same feeding value for poultry as wheat straw or sawdust.

Green Food

During the winter spring conditions in the poultry house should be duplicated as nearly as possible. Green food should always be provided. It tends to keep the birds digestive organs in good condition and to keep her sewage system open which in turn result in better health, more complete utilization of food material and increased production. Cabbages, beets, mangles, turnips, sprouted grains, etc. are satisfactory.

Animal Foods.

Animal foods replace the grasshoppers, earthworms, etc., the birds catch during the growing season. They are absolutely essential to profitable winter egg production. Buttermilk or skim milk is probably the best substitute for insect life. Dried beef scraps (obtainable from poultry supply or feed dealers) are perhaps the next most suitable and widely used. Green bones with adhering meat and muscle, beef heads, lungs, livers, etc. from butcher shops, may be used to advantage where they are obtainable. Practically all such foods are expensive, but this must under no condition prohibit their use. They supply in a concentrated form the necessary constituents of the albumen or white of the egg.

Mineral Foods

Birds should always have access to plenty of sharp gravel, ground rock, etc. In the gizzard this material, though in itself possessing no food value, assists in the digestion of grain and other hard portions of the birds ration. Birds running at large in summer always have considerable amounts of grit in their gizzards.

Lime in some form is as necessary as grain. A bird which produces two hundred eggs in a year must produce two and one half pounds of egg shell which is practically all lime. If a bird is fed on a prison diet of corn and water, and unfortunately some are, the amount of grain consumed to obtain the necessary lime for two hundred egg shells becomes a question of tons instead of pounds. Ground oyster shells, clam shells, dry egg shells, etc., will fill the bill.

Water

Water is indispensible. It has no food value but assists in making foods more readily assimilable. Experimental data shows the omission of water to reduce the egg production about 50 per cent.

Feeding Method

As early in the morning as possible the birds should have a feed of whole or cracked grain which must be fed in deep litter, preferably dry wheat straw. There is little danger of losing any of the grain unless it is the finer parts too small for the bird to pick up. Eight or ten inches of straw will answer the purpose. One quart of grain to twenty-five birds is an average feed.

The evening feed should be of whole grain and fed as late in the afternoon as possible. If fed in the litter the birds should be given about an hour to scratch for it before darkness hinders them. Many give the last feed in a trough to avoid possibility of any birds not obtaining as much as they desire. Feel their crops after they go to roost. They should be full.

In addition to the whole grain a mash should be fed as birds cannot digest enough whole grain to lay the most eggs possible. If a dry mash is used it may be put in a hopper against the wall and the birds allowed access to it at all times. The amount of mash a bird eats depends largely upon its palatability, and as a rule they do not overeat. If they do, and show signs of becoming too fat, prevent their access to the mash each day until their appetite is largely satisfied with the whole or cracked grain.

If a moist mash is fed it should be given late in the forenoon or about noon. Give only what the birds will eat readily in a few minutes.

Mashes vary greatly in composition. One containing two or three articles is usually as satisfactory as more complicated ones. Equal parts by weight of bran, wheat middlings and cornmeal will work very satisfactorily. If one of these is not available it may be substituted with ground buckwheat finely ground oats, or various other foods obtainable. Wet mashes should be mixed with milk if possible and should be just moist enough to hold together when squeezed in the hand. If milk is not available water should be used.

Milk should be before the birds all the time. Being about 90 per cent water it will largely if not entirely replace water as well as supply the animal food. If beef scrap is fed it should be available in a hopper at all times. If birds have not been accustomed to milk or beef scrap feed them sparingly for a few days. Oyster shell or some substitute, grit, and charcoal should be fed from a hopper.

Green food should be constantly before the birds or at least given daily. Cabbages, mangles, etc., may be stuck to a nail in the wall about eighteen inches from the floor. Frozen or decayed vegetables must never be used. They disarrange the birds digestive system, often with serious results.

Sudden changes of any consequence in a birds ration must be avoided. The birds system becomes adapted to a certain system of feeding and is not readily altered. Sudden changes frequently result in temporary reduced production.

JOHN A. BRUCE & CO., Ltd.
Established 1850. HAMILTON, ONTARIO

birds all along, sizing up their good qualities and their bad, keeping the ones which showed good possibilities and discarding the ones which gave no promise whatever of being good breeding stock.

No matter whether the poultryman is selecting his breeders for show-room stock or for utility stock, the prime considerations are vigor and vitality. A bird may have a wonderful ancestry with wonderful records back of it, yet of what use is it to breed from this bird if t is not healthy and vigorous? What is wanted is a bird that will produce fertile eggs, which in turn will produce healthy, vigorous chicks; but these results will not be obtained from birds with low vitality.

Evidences of vigor and vitality in the male may be seen in a well-proportioned and well-set body, good carriage, bright eyes, bright and erect comb and well-shaped head. Good-sized legs with a wide distance between them are also evidences of high vitality and vigor. A scrawny-looking male, one that is narrow-breasted, has a crow-shaped head and a drooping tail will not produce many healthy chicks. The male birds is half the flock and should therefore receive a great deal of attention when the pens are being mated.

By experimentation it has been found that the egg-producing ability is transmitted to the progeny through the male bird. It is, therefore, advantageous when selecting the breeders to choose the male birds whose mothers were good producers. This does not mean that a high-producing flock may be obtained by mating poor hens to males whose mothers have been high producers. What should be done is to mate high-producing females to males whose mothers have been high producers and obtain as progeny females that will be good producers and males that will be useful as breeders to other flocks.

When no pedigree records are available the external characteristics mentioned above will have to be relied upon.

Choose Hens With Perfect Health Records

A very good plan to follow in selecting the breeding males, when the equipment and circumstances permit, is to set up a few exhibition coops and place the males in them. By having all his birds before him the poultryman can compare one with another. After selecting, say, twenty of the best—the number, of course, depending upon the number of breeders desired—he may put these in coops by themselves and select the best from this number; and so on, by the process of elimination, until the required number of male birds has been obtained for the pens.

Just as the male bird must have a healthy and vigorous appearance and must be purely masculine, so must the female be healthy and vigorous and present a purely feminine appearance. She must have a neat trim body, showing capacity for production—that is, wide in the pelvic region and between the pin bones, with a long keel bone and a wide pelvic arch. She must not be awkward nor rangy in appearance. Above all, she must be healthy—it does not pay to breed from a bird that has ever been sick, for the weakness is apt to be transmitted to the offspring, and unhealthy chicks will be the result. A hen with a bright eye and a bright flexible comb shows vitality and can be relied upon, if possessing the other points mentioned above, to be a good choice for the breeding pen.

In choosing the female breeders do not select pullets. The pullet year is the year of maximum production, in which the birds are given the feed that will produce the largest number of eggs. Obviously, the proper nourishment for the developing germ cannot be put into the egg while forcing feeds are being fed. This is one cause of the poor-looking chicks obtained from pullets.

There are several different systems of mating birds, one of whirh is known as the large-flock system of mating. In this system a certain number of males is placed with a large flock of females, the number of male birds depending upon the size of the flock.

There is also the small-flock mating, which consists of placing one male in a small pen of females. A disadvantage of this system is that often the male bird will practice selection, mating wih only certain birds and thereby causing eggs from other birds in the flock to be infertile.

Again, there is a system known as stud mating, in which the male bird is kept confined and the hens are brought to him one at a time. The traveling-male system is just the opposite of this, the hen being confined to a run by herself and the male bird carried from pen to pen.

Large-Flock System Requires Least Care

A system which is popular among some breeders is the system of alternating males: Two males are used for one small flock, one being in the pen one week and the other the next week, and so on. This eliminates to some extent the possibility of selection by the male bird.

Of all these systems the large flock, the small flock and the system of alternating males are the most commonly used. The large-flock system requires, perhaps, the least care of any and gives as good results as any. This is really the only system to use where buildings and yards are limited—provided, of course, that all the birds come up to the standard set by the poultryman. In other words, if a hundred breeders are to be kept, and they all give evidence of being good producers and are in good condition, there would be nothing gained by placing ten hens in a yard and making ten pens of them, when as good results could be obtained from having them all in one yard.

Generally one male bird is placed in the pen for every ten hens. There is more chance of obtaining fertile eggs from a large pen of this sort, as it is not likely that the same hens would be neglected by all the cockerels. This proportion of females to males is generally used for Leghorns. For Plymouth Rocks, Wyandottes, Rhode Island Reds and other heavy breeds the proportion is one male to about eight females.

The home is the best place to teach children the most valuable of all lessons—that unless they serve others they cannot be expected to be served by others.

You Can Examine

INVINCIBLE FENCING

Before you buy it

INVINCIBLE Fencing reaches the farmers through the most economical channels of manufacture and distribution. The steel for the wire is made in our own mills—and so is the wire for the finished product. Thus we ensure a quality of raw material in keeping with our high standard, as well as eliminating unnecessary profits. Then we distribute Invincible Fencing through dealers, which has been proved to be the most economical and satisfactory method.

From these Invincible dealers—the best dealers all over Canada—you can obtain immediate delivery; no waiting for shipments, no sending your money before you can see the goods.

You do not have to take our word for the high quality of Invincible Fencing—you can examine it at your local store. You may check its weight, see the straightness of the stays, note the heavy galvanizing, observe the perfection of its weave and test the strength of its locks.

Do this—then buy on your own good judgment—this fencing that is made by Canadian workmen—and keep your money in circulation in Canada.

Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

The sense of humor is the oil of life's engine. Without it the machinery creaks and groans. No lot is so hard, no aspect of things so grim, but it relaxes before a hearty laugh.—G. S. Merriam.

THE ENGAGEMENT RING

(By Belle Maniates)

"Philip," observed Mrs. Carmen on her first visit to her son-in-law. "I am so glad to see you and Greta so happy and so comfortablly settled. I am glad to see that she still wears her wedding ring."

Philip Kendrick looked up in questioning surprise.

"She would never wear her engagement ring," explained Mrs. Carmen, "and such a beautiful solitaire as you gave her! The girls were all envious of her when they saw it. We teased her a great deal about wearing it so seldom. We pretended she had pawned it. But there is Greta waiting for me to drive with her."

After his mother-in-law had left the room, Philip stared motionless at the book he held. His face was never very expressive in repose, but its quiet strength when lighted by the flashing keenness of his gray eyes and the hidden sweetness in his smile had proved irresistible to Greta. Now, reflecting on his mother-in-law's speech, his face was stern and troubled. He had not given Greta an engagement ring. It had not occurred to him to do so. He knew little about the customs of such affairs. Greta had been his first and only love. She was his ideal of everything charming and noble in women, and he could not conceive of her stooping to deceive her mother or anyone. There was some mistake about ot, of course Greta would explain when he asked her. She was so shyly and sweetly frank with him.

He grew impatient, however, in waiting for his confident forecast to be verified. The little imperceptible germ of distrust was working against inaction. He went up to his wife's dresing room. On her table was a little tray of ornaments, but no rings were among them. The drawer to the table was open and he saw a jewel cabinet within. A tiny key lay beside it.

Philip turned in self-disgust from his longing to investigate the contents of the cabinet, and he left the room, feeling for the first time in his life like a culprit. In the hall he met Greta radiant from her drive.

"I am having such a lovely time, Philip, showing mother about."

He decided to defer the discussion of unpleasant subjects until after the termination of her mother's visit.

"We met one of Greta's former suitors," laughed Mrs. Carmen, "Jack King. When Greta's engagement to you was anounced he went moping about and finally left for the West. He has just returned."

"If he felt any regret," said Greta, "it must have been only a pasing one, for he looks hale and hearty now."

She spoke lightly, but Philip's searching eyes noted the bright flush that overspread her face. It deepened as she spoke again.

"Jack invited us all to his rooms tonght . He is going to have a few in for bridge. Would you like to go Phil?"

"It will be impossible," he replied. "I have a very important business engagement, but you and your mother must go, and I will call for you."

Hhe thought he detected a look of relief in Greta's fair face.

"All right! Mother is so fond of bridge."

"And of Jack, too," asserted Mrs. Carmen. "I must confess, Philip, that before we had come to know you, our choice of a son-in-law lay in Jack."

"Probably," mused Greta aloud, though speaking to herself, "if I had not come to know Philip well, I should have married Jack, for everyone, mother, Lena and all my young friends connived and contrived to throw us to gether, and propinquity often wins."

She met Philip's queer searching glance as she finished this remark, and she shrank from his continued scrutiny. The little germ flourished throughout the day, although Philip conscientiously and relentlessly did his best to destroy it. That evening his business engagement terminated much sooner than he had anticipated it would, and he telephoned Greta asking her if he should come for them with the touring car and take her mother for a moonlight ride.

"It would be pleasanter for you than bridge," he suggested.

Greta's soft laugh came back over the 'phone.

"It would;; but don't feel sorry for me, dear. Two of Jack's friends disappointed him, so Jack and I are not playing. Oh Philip, Jack wants to see that locket brother Tom gave me for a wedding present. It is in my jewel cabinet in the drawer to my dressing table. The key is there somewhere."

He went up to her room. Greta was not very orderly. The drawer was open, as was also the jewel cabinet. He found the locket, a most beautiful one, set with pearls. Someway, he had never associated Greta with jewels. His presents to her had been books, pictures and curios. After all, it was natural for every woman to like jewels. He ought to have asked her what she wanted.

Suddenl yit struck him as rather odd that she would want to show Jack this locket. He opened it. Within was a tiny soft curl. He remembered that when Greta had showed him this locket she had said that some day he should see what was inside. That it was something of hers that Tom had put in there. He had pleaded to see it, but she had denied him, saying he woould think it silly. Silly! As if every hair of her head were not dear to him!

In vain he looked for the ring. Back in a corner of the drawer he espied a tiny box. He opened it. A ring with a huge diamond lay within. So this was her engagement ring! Maybe it had been. He walked with uncertain steps to the open window, and gave himself up to the maelstrom of forcing doubts that grew to convictoins. Jack and Greta had been engaged. In a lover's quarrel they had broken the engagement, but he had made her keep the ring, and she had accounted for her possession by attributing the donation to him. Now Jack had reappeared and her old feeling for him had returned. He had returned at an opportune time. The honyemoon was over, and Greta doubtless found everyone's prophesy true; she had discovered that her husband was posy and old fashioned. How enlivened she had been by the diversion of her mother's visit. He finally gathered himself together and went out to the car which he drove himself.

Jack's apartments were in the Strathmore. He rang the bell and ran the automatic elevator up to the seventh oor. Jack admitted him, but instead of taking him into his library, he opened the door that led into a cosy where Greta was comfortably ensconsed among some pillows.

"It wasn't much sport looking on at bridge," she explained, "so Jack and I have been talking over old days and—other things. Did you bring the locket, Philip?"

He took it from his pocket and handed it to her. She passed it on to Jack who was enthusiastic over the shape, size, setting of the pearls and so forth.

"May I open it?" he asked.

She looked hesitatingly at Philip.

"No-o, not now!"

Mrs. Carmen appeared in the doorway. "I thought I heard your voice, Philip. Will you take my hand? I want to look at Jack's old china.'

He played the cards mechanically. After the game, the little party broke up. Greta asked the Gardners to ride with them, and they sat in the tonneau with Mrs. Carmen. Greta took the seat beside him. Presently she broke the silence.

"Philip, I see you are getting the speed habit! I am glad; still I told mother you were such a careful driver.

He slowed up.

"I did not notice," he said.

His voice sounded oddly.

"Philip, you seem rathef harassed tonight. Is there anything in your business that is worrying you?"

"No," he answered brusquely.

"What is it then?"

"Don't talk, please, when I am driving."

She relapsed into silence, and he was glad when they reached home. Early the next morning Mrs. Carmen received a telegram from her daughter Lena saying that her baby had the measles. No grandmother could miss the opportunity to display her superior wisdom and experience at such an epoch so she took her departure by the first train, to Greta's regret and Philip's satisfaction. He felt that a crisi was developing and it was much better that they should be alone.

After dinner that night he came into the library where Greta was sitting.

"Where is your locket?" he asked abruptly.

She looked up, starteld.

"Why, Philip, didn't you bring it home?"

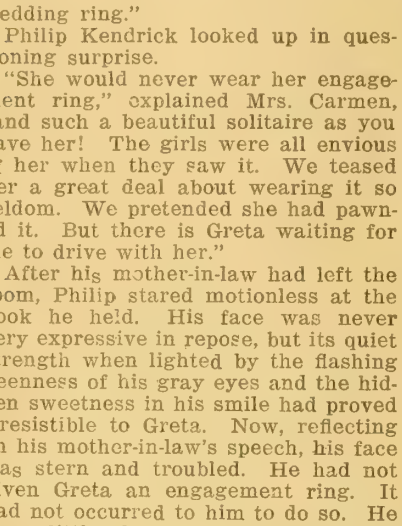
"No; I didn't see it again after I handed it to you and—Jack."

"I forgot al labout it. It must be at Jack's, though I should have thought he would have sent it to me. I'll telephone now."

"Why did you wish to show it to him?" he asked as she was looking up the telephone number.

"I was going to tell ou yon the way home, but you said not to talk to you," she said a little resentfully. "Halloa Central, 117 Main, please. Why you see Philip, Jack wants—Haloa, Jack! You know my voice? Well you should—"

It seemed to Philip that she talked for an hour a string of nonsense over



ROYAL YEAST CAKES

Now that the new government standard flour is in general use, the quality of the yeast you use is more important than ever. Use Royal Yeast Cakes. Their quality is absolutely reliable. Bread made with Royal Yeast will keep fresh and moist longer than that made with any other.

the telephone. In reality, it was a few seconds over four minutes.

"Jack says mother picked it up and put it in her bag," she said finally as she hung up the receiver and turned around.

"Write to her for it," he said curtly.

"Why, Philip, she will send it, of course," her tone of voice showed hurt surprise. "She forgot she had it, likely, and she left in such haste and excitement."

Further conversation was prevented by the entrance of one of Philip's friends, and when he left Philip went with him for a stroll and smoke—he said. When he returned an hour later Greta was asleep.

At luncheon the next day she informed him that her mother had returned the locket with a long lecture on carelessness. The lecture evidently did not make much impression, for when Philip came home to dinner, he saw the locket on the library table. An uncontrolalble impulse moved him to gaze again upon the little curl. He opened the locket.

It was empty.

He went up to his wife's room, his face pale, his eyes gleaming.

"Greta," he said abruptly. "I want to know the truth about your diamond engagement ring!"

"Oh!" she gasped, her face stamped with guilt and confusion. "I—who told you—Philip?"

"Your mother told me."

"She didn't know. She thinks you gave it to me. You see, Philip——"

But he had gone. He went to his deserted offices. He was choking not so much with jealousy as with a wild longing for his old faith and trust in her. He felt that he must go away—anywhere. All the figments of his jealous fancy passed in quickly moving pictures. Her being alone in the den with Jack, talking over old days, the curl from her locket, the locket that would have remained with Jack had he not asked about it. The explanation about her mother's taking it was a falsehood of course. Her confession and confusion about the ring showed there was something guilty behind it all.

Married only three months and his heart and home wrecked! And he loved her! He always should love her. In all his wild accusing thoughts he felt a tenderness for her. Her girlishness, her very guilelessness and failure at deceit appealed to his protection. She should have it, now more than ever. He braced himself to quick thinking and to action. He wrote her a letter, the thoughts coming faster tha nhe could write them. He told her that he knew all about her engagement to Jack and that she still kept his ring; that she felt a return of her love for him, and that she had left the locket in his rooms that he might take the lock of hair.

"I cannot bear to keep you from happiness," he wrote, "but be patient, Greta, until I can arrange for your freedom in a quiet and legal way. Then you and Jack can marry, but until then, for your own sake you must not seet him. I see now that I was wrong to come into your young life."

He went home. It was only ten o'clock, but the house was dark. He slipped the letter under her door. Then he went down to the library trying to quiet his agitation of heart and mind. After a long time he heard a soft footfall, a gentle rustle in the adjoining room.

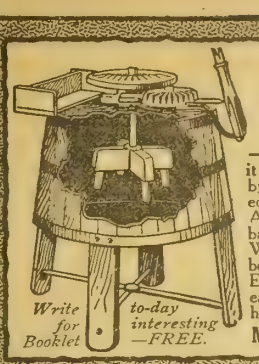
"Philip!"

He looked up quickly. Her face was pale and her eyes wet, but they held the sweet look he loved, and there was a half smil in the tender curve of her lips.

The woman he loved stood beside him and laid her hand on his shoulder. There was a little quiver of laughter in her voice.

"I can't marry Jack, dear, even if you give me my freedom. He is going to be married to a girl he met out West."

He looked at her unbelievin,



Maxwell
"Home" Washer
—the washer that not only washes the clothes mechanically, but does it better than they can be washed by hand. There's no "skimping" by the "Home" Washer—light or heavy articles are cleaned with equal thoroughness. There's no tearing of delicate fabrics, either. And it does the work in half the time! No more long-drawn-out, backbreaking washdays anywhere there's a Maxwell "Home" Washer; Just put the clothes in, and the rest is hardly work at all—because the "Home" Washer is so light, noiseless, and easy-running. Enclosed gears make it absolutely safe: "springs" make cover lift easily. Made of best quality cypress, handsomely finished. Runs by hand-power or water-motor. See it at your dealer's.
MAXWELLS LIMITED, Dept. X St Marys, Ont. 34

"We were never ngaged, I think Jack thought at one time that he cared for me, but when I knew that I loved you, even before you had told me—I let him understand that I could never care for him. Mother was not in earnest about him moping for me. The night of his party he took me into the den to rave about his girl. He wanted to give her for a wedding present locket like the one Tom gave me. And that lock of hair was my baby curl. Tom stole it from mother's treasure box. She didn't know it until she opened the locket when she was at Lena's. She took it out and said it belonged to her as long as she lived, and then she would bequeath it to you. I love you, Philip, and——"

But she found herself clasped in his arms, and felt his penitent kisses upon her face, and her heart sang and cried

FREE PRIZE PUZZLE $4,500.00

In Cash has been Given Away FREE also hundreds of Merchandise Prizes
$200.00 more IN CASH will be Given Away as follows

1st Prize, $50.00 in Cash. 2nd Prize, $40.00 in Cash
3rd Prize, $35.00 in Cash. 4th Prize, $25.00 in Cash
5th to 9th Prizes—Each $10.00 in Cash.
TOGETHER WITH MANY MERCHANDISE PRIZES

Herewith will be found the picture of an Aviator who has just dropped a bomb on a pile of Shells. At first glance the Airoplane and the Explosion appear to be all there is in the picture, but by careful study the faces of several soldiers will be found. There are 7 of them in all. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Four Thousand Five Hundred Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Upon receipt of your reply we will send a complete list of the names and addresses of persons who have won $4,500.00 in Cash Prizes in recent contests held by the publishers of this advertisement. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, as all previous winners of cash prizes are debarred from entering this contest.

with his.

Later, when, his arm about her, they were going up the stairs, she laughed softly.

"Oh, the ring! I've not told you."

"I a m ashamed to ask, dear," he admitted.

"I am not conventional, and I didn't mind that you omitted the engagement ring," she said, "but mother, Lena and the girls were all ready to criticize, as people always are at such times, and I didn't want them to find an opening wedge for flaw, so I just bought the biggest, brightest paste jewel I could find, and only occasionally flashed it before their ignorant eyes. It was only too effectual, I see now. I wanted to tell you; it was such a good joke on them, but I was afraid you would think I was criticizing for not giving me a ring."

"I am thickheaded, Greta, but tomorrow I shall buy the brightest diamond I can find, and you must wear it."

"All right, Philp, we will be engaged all over again."

NUT BREAD

1½ cups barley flour.
½ cup buckwheat.
1¾ teaspoons salt.
¾ teaspoon soda.
2½ teaspoons baking powder.
¾ cup molasses.
1 cup sour milk.
¾ cup choped walnut meats.
Raisins.

Mix and sift dry ingredients and add liquids. Let stand twenty minutes before baking. Bake slowly fifty or sixty minutes in greased pans in a moderate oven.

Makes two small loaves.

POTATO STUFFED WITH SAUSAGE

Wash thoroughly medium-sized potatoes and peel. With an apple corer push down through the middle to the bottom and remove the core thus made. Fill the cavity remaining with well-seasoned sausages, which have been slightly browned, and pour over the drippings. Bake until potatoes are done. They should be an appetizing brown.

ORANGE SPONGE

3 oranges, juice and pulp.
¼ cup white sugar.
¾ lemon, juice and pulp.
2½ pints of cold water.

Strain. Mix three tablespoons cornstarch in a litle cold water; stir into the liquid and let boil ten or fifteen minutes. Set aside to cool. Beat whites of three eggs, and whip into the sponge with a Dover egg beater, when it is ready to serve.

CRUMB BREAD

2 quarts hot water.
1 cup molasses.
4 teaspoons salt.
1½ quarts bread-crumbs.
1 yeast cake dissolved in 2 tablespoons lukewarm water.
4 tablespoons shortening.
1 quart graham flour.
White flour to knead.

Dry and grind bread in the meat-chopper before measuring. Add molasses and salt to water, pour over crumbs and when lukewarm stir in yeast. Add graham flour and white flour to knead. Brush with melted fat, let rise overnight. In morning sape into loaves. Brush with fat. Let rise until double in bulk.

THRIFT FRITTERS

2 cups cold mashed potatoes.
½ cup of left-over corn.
1 onion, minced fine.
1 beaten egg.
Salt and pepper.

Mix well and saute in a frying pan in which is a teaspoon of cooking oil. Brown well on one side, then carefully turn and brown on the other side. Peas or salmon can be substituted for the corn with equal results.

When ironing if the clothes become scorched from too hot an iron, the scorch can be removed with peroxide of hydrogen. If scorched quite badly several applications may be necessary. If desired, the warm iron can be pased over the spot after applying the peroxide, as that tends to remove it a little sooner.

Keep a box of rubber bands handy in the kitchen. When salmon, gravy, or sauces which can be used again are put away in small jars or cups, use pieces of tissue-paper for cover and hold them firm with the rubb bands. In this way the food is pr tected from dust and no odor escape

They all come out of the "BEAVER" FLOUR Barrel

THE T. H. TAYLOR CO.
BEAVER FLOUR
MILLED OF BLENDED WHEAT

"Beaver" Flour is just as good for Pastry as for Bread. It is the product of Ontario winter wheat, blended with western spring wheat to increase the strength. "Beaver" Flour has the best qualities of both kinds of wheat—the whiteness, lightness, delicate flavour and perfect Pastry making qualities of Ontario winter wheat—coupled with the extra strength of western spring wheat. Being scientifically blended in exact proportions, the blended wheats are always the same in strength and quality—and so is the flour.

If you have never tried a blended flour, you cannot imagine what a difference there is between "Beaver" Flour and the usual western spring wheat flours. Get a sack of "Beaver" Flour at your dealer's, and try it for yourself.

MOTHERS AND YESTERDAYS

(By Calvin D. .Wilson.)

A woman who is famous for her beauty and who is now fifty-five years of age and wonderfully well-preserved, has recently been giving the public the benefit of her experience in saving health and good looks. In her care of herself, she declares one of the elements is that she "has no yesterdays." She must mean, of course, that as far as possible she strives to forget all the disagreeable and painful things of her past.

While mothers, as a rule, are not concentrated upon rivalling professional beauties, yet there is wholesome good sense in what this particular woman advises, from other points of view. The counsel about having no yesterdays is, after all, essentially apostolic, for Paul, in regard to the heavenly race, declares he forgot the things which were behind and pressed forward to those that are before. A prominent statesman recently asserted that he is not nearly so much interested in what a man has done as what he is going to do.

For the mother who is training children, the present and the future are in reality the fit subjects of earnest and hopeful thought, and not the past. She should bravely let the mistakes pass, correct what can be remedied, and go on. To us the best advice we ever received was from Dr. Talmage, who said; "Sing fourteen verses daily to the tune of the Long Meter Doxology. The words are 'Go on, go on, go on,' "

Forget the disagreeable things of the past. One of the brightest moments of Christian, in "Pilgrim's Progress," was when the load on his back was loosened and fell away. Lyman Beeeher dcclared he was never really happy until it occurred to him one day that he did not have the responsibility of managing the universe, that God would do that, that all he had to attend to was his own particular duty.

There is no class of individuals who have more need of getting rid of yesterdays than mothers, who have enough responsibility to carry with the present and the future. Let them glean the essence of their experiences in the form or wisdom and cast the rest away, for their own hearts' lightness, for the joy of their children, and for equipment for the present houd.

EAT POTATOES FOR ENERGY

A medium-sized potato, weighing about 3½ ounces, supplies about as much starch as two small slices of wheat bread one-half inch thick. In other respects, also, the potato measures up well with wheat bread and even has the advantage over it in supplying certain salts which the body needs to counteract the acidity resulting from the use of such foods as cereals, meat and eggs.

Good food material is lost if potatoes are pared before they are cooked. Besides a loss with the paring itself, even when carefully done, food substance is dissolved out of potatoes when they are pared and then soaked or cooked in water, especially if they are put on to cook in cold water. Steaming and baking cause the least loss of food value. If cooked in water, (1) the yshould not be pared until after they are cooked; (2) they should be put on to cook in boiling salted water.

POTATO SOUP

2 cupfuls of hot riced or mashed potatoes.
1 quart of milk.
2 slices of onion.
3 tablespoonfuls of butter.
2 tablespoonfuls of flour.
1½ teaspoonfuls of salt.
Celery salt.
Pepper.
Cayenne.
1 teaspoonful of chopped parsley.

Scald the milk with the onion; remove the onion; add the milk slowly to the potatoes. Melt the butter; add to it the dry ingredients; stir the mixture until it was well blended. Add this to the liquid mixture, stirring it constantly, and boil the soup for one minute. Strain it, if necessary, add the parsley and serve it.

POTATO SALAD

6 cold boiled potatoes.
4 tablespoonfuls of salad oil or melted butter.
2 tablespoonfuls of vinegar.
½ tablespoonful of salt.
Cayenne Pepper.
2 Tablespoonfuls of chopped parsley
Few drops of onion juice.

Cut the potatoes into half-inch cubes. Make a dressing by mixing thoroughly the other ingredients. Pour this dressing over the potatoes, and allow them to stand for fifteen minutes. Drain off any dressing that may not have been absorbed by the potatoes. Garnish the salad wtih sprigs of parsley, and serve it with boiled dressing. One cupful of chopped celery or two hard-cooked eggs, chopped or sliced, may be added.

Holding War-Time Markets for the Canadian Farmer

Canada is called upon to help to feed Europe during the period of Reconstruction.

This is good business for the Canadian farmer as it means he may be assured the same markets as he had while the fighting was on

BUT— these prospective customers are little better prepared to pay cash for their purchases than they were during the War. To hold these markets for you, and make it possible for you to get the cash, the Dominion of Canada must extend credits.

Must Supply Credits

How is Canada to supply the necessary credits and finance this international trade? From the invested savings of her people.

The plan has been most carefully worked out. If the Canadian people co-operate to the utmost of their ability, the markets are assured, the people profit by their investment, their money is available when needed, and since Canada will, in due course, receive back the money advanced to the buying nations, not a dollar is added to the permanent indebtedness of the country.

$5.00 for $4.01

The Dominion of Canada is raising the necessary money by the sale of War-Savings Stamps.

In your own interest, buy War-Savings Stamps. Get every man, woman and child you can talk to, to buy War-Savings Stamps. The price this month is $4.01.

Each stamp will be redeemed on Jan. 1st, 1924, by the Dominion of Canada, for $5.00.

As an aid to the purchase of a War-Savings Stamp, you can buy Thrift Stamps at 25 cents each. Sixteen Thrift Stamps on a Thrift Card represent $4.00 on the purchase of a W-S.S.

W-S.S. and Thrift Stamps may be purchased at Money-Order Post Offices, Banks, and other places displaying the sign at the top of this announcement.

TWO MONTHS OLD BABY HAD BAD COLD.

DR. WOOD'S NORWAY PINE SYRUP SAVED HIS LIFE.

It takes the life out of a mother to see the child—the idol of her heart—slipping away, succumbing to the cruel cough that all the remedies she has tried won't cure.

There is nothing so good for children's coughs, or colds, croup, whooping cough, or bronchitis as Dr. Wood's Norway Pine Syrup.

It is pleasant to take, and it cures so quickly and thoroughly that the heart of the mother is delighted.

Mrs. Angus McKinnon, Richmond, P.E.I., writes:—"Last winter my baby was just two months old, when he took a bad cold. He could not keep anything on his stomach with the cough. I tried doctor's medicine, but it gave no relief. I told my husband I would try Dr. Wood's Norway Pine Syrup, and I must say it saved his life. I just used four bottles and now he is perfectly cured, and I can't help but express my thanks to you for curing my baby.

Two years ago I used it for one of my girls. She had a cold and cough, but the doctor's medicine was no good for her. I got six bottles of Dr. Wood's Norway Pine Syrup, and it gave her a perfect cure. I can not praise it half enough."

The genuine Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years. Don't accept a substitute and perhaps endanger your child's life.

Price 25c. and 50c. Put up only by The T. Milburn Co., Limited, Toronto, Ont.

WINTER VEGETABLES AND ATTRACTIVE WAYS OF SERVING THEM

In winter a cook's attention is specially directed to vegetables. In the other seasons vegetables are so much with us that we use them naturally. In winter we forget how valuable they are. Lack of them in the diet was what uesd to make sulphur and molasses a national habit. We tried to cure, by heroic methods, the sluggish condition which months of unwise diet had got us into. Nowadays, we eat plenty of fruit and vegetables and throw old-fashioned pill-boxes and spring tonics into the rubbish heap.

As regulators of the digestive system, vegetables are most important. The woody fibre they contain makes them laxative, and some of the juices, that of onion especially, are better than drugs in their wholesome action.

All vegetables contain some mineral salts which are necessary to build up and keep sound the bony structure of the body. Leaf vegetables, like cabcage, contain in addition a substance now proved to be absolutely necessary to healthy growth. Finally vegetables furnish the variety which is especially a virtue in winter menus.

If the canning season found us valantly at work, there are few vegetables not available to us the year round. For those we buy in the market we need tests, so that our money shall go as far as possible. When you buy potatoes in bushel lots, select one at random before purchasing and cut it open. If there are brown streaks they indicate fungus disease, and bring the whole lot under suspicion. Squeeze the pieces of potato to see whether drops of water form and run off. If they do the potatoes will be soggy. A decided yellow tinge means that they are not likely to cook well. If green, they have been exposed to the sunlight and rendered unfit for usee. Potatoes should have smooth skins, and be of moderate and uniform size in order to be usable to the best advantage.

Cabbages should be vivid in color, the leavs crisp when broken, with a head which feels hard and firm in the hand. Root vegetables, like carrots and parsnips, should be hard also, not flabby or shiveled.

General Direction for Cooking

In preparing vegetables for cooking, it is wise to remember that the portion just under the skin contains the best food value. Scrape the skin off when possible, otherwise pare very thin.

Three methods are possible in cooking—baking, boiling and steaming. The third method is best, because by it the greatest amount of both flavor and nutrition are conserved. A colander over a kettle with a tightly fitting cover will answer the purpose unless we have a special steamer. The type of steamer which is built in three or four stories is a saving for those who use gas stoves, becauase in it a number of things can be cooked at once over one burner.

Solid vegetables, like squash, beets, and onions, are delicious baked. Put them into a shallow pan with a little water in the bottom. The oven should be moderately hot. Neither a slow oven, nor a very quick oven is economical in baking potatoes or any other vegetable.

When vegetables are boiled, the water into which much of the mineral matter has dissolved should be saved for making soups and gravies. Use just enough water to prevent the vegetables from burning on. Whatever the method of cooking, vegetables should not be cooked after they are tender. Beyond this point they lose flavor and appetizing appearance. If we boil vegetables the water should be jumping when they are put in. Cook "above ground" vegetables, such as aspargaus, spinach, etc., in covered kettles to preserve the color. Strongly flavored vegetables, like cabbage, onions, and turnips, ought to be cooked in uncovered containers, and the water changed at least once during the process. Boiling water only must be used to replace that thrown away. A pinch of soda in the first water for onions improves them.

Salt is always added to vegetables, and the time to do it is important. Allow one level teaspoon of salt to each quart of water. Fresh, juicy vegetabls should have the salt added to the water at the beginning. Old, tough vegetables do not take salt until after they are cookd near tender. Peas and beans must be cooked in unsalted water. Many also prefer potatoes cooked in this way with salt sprinkled over them after they are drained.

The time for cooking vegetables varies from ten minutes to over an hour. No time-table of any value can be given, because the time depends upon such variable factors as size and age. The smaller the prices the less the time. This is a useful rule in an emergency, but we have to remember that every time we cut a vegetable to be boiled, we lose some of its food value, unless we save the water in which it was boiled.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

GIVE NATURE A CHANCE
Gin Pills Instead of Medicine

ALL scientists agree that pure blood is the basis of good health. It will build up, restore health, fortify against disease. The work of purifying the blood falls to the kidneys. If the kidneys fail to perform their function, impurities and poisons are carried in the blood stream to all the organs and joints, resulting first in backache, pains across the groins, down the sides, dizziness and urinary derangements. If neglected Rheumatism, Sciatica, Gravel and Inflammation follow.

The chemist who worked out the formula for Gin Pills to restore normal Kidney action thus placed in the reach of every man and woman, a great preventive remedy that gives Nature her chance to cure the evils due to poison in the blood. That is a simple scientific fact. Gin Pills can be obtained almost everywhere at 50c. a box, or a free sample can be obtained by writing The National Drug & Chemical Company of Canada, Limited, Toronto, Ont.—U.S. residents should address Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y. 309

For plain seasoning this is a good general rule. Modifications may be made to suit individual tastes: To each quart of cooked vegetables add four tablespoons of butter, one teaspoon of salt, and one-eighth teaspoon of pepper.

Good tools are as necessary to the cook as they are to any artist or craftsman. Here are a few which we need. A wire—not a wood—potato masher, a potato ricer, and a French cup-knife for making potato balls for garnisr. A pastry-bag, with one or two tubs, is also a convenience. None of these utensils is an extravagance. The initial cost is not large, they last practically a life time, and they add much to the attractiveness of many a meal.

DO NOT NEGLECT BRONCHITIS IN THE BABIES

The frequency with which bronchitis in the infant develops into broncho-pneumonia is appreciated by very few mothers. One of the main causes of broncho-pneumonia in babies is extension of the inflammation from the bronchial tubes and, hence, to the lung itself. The danger of broncho- pneumonia is probably, well understood, but how many mothers consider that a neglected attack of bronchitis frequently leads to this dangerous disease? In adults, extension of this inflammation is a comparatively rare thing, but not so in childrn, and particularly not so in those under two years of age. Among those classes of people where bronchitis is treated early, the number of cases of broncho-pneumonia from this cause is very low.

During the late winter and early spring, bronchitis is most common. Any mother who has watched her baby will agree when we say that a baby from a slight sickness may become very, very ill, will appear prostrated, and all of a sudden will take a turn for the better and seem to be itself in a few days. This goes to show how quickly the infant seems to change its condition. On the other hand, the disease seemingly of little significance to an adult may be just the type which will cauase death in the infant. The baby will not seem to rally, but rather go down, and, as in the case of regaining health quickly, wil just as quickly slip beyond all human aid. All bronchitis cases need immediate attention.

Causes and Symptoms

High winds and dust seem to contribute to the spread of bronchitis. It is a condition of inflammation of the bronchial tubes with the production

of mucus or phlegm. This causs the patient to cough in order to get rid of it. The cough may be "tight" or "loose" according as to whether this mucus is sticky and hard to remove ro more fluid and more easily expiled. Accompanying the cough there is usually a slight fever, and more or less irritability, loss of appetite and diarrhoea. There is frequently an inflammation of the nose, or the so-called "cold in the head." Bronchitis is not in itself dangerous, but the complications which are likely to follow are the most dangerous and the most fatal with which doctors must have to deal.

Care of the Patient

The child with bronchitis needs air, but not bad air, nor yet cold air, nor the damp, foggy air of the outside. If the room is small where the baby or children lie ill, a little stove on which can be placed a kettle of water (kept boiling) is of great benefit to the sufferer. The temperature of the room should be kept as nearly as possible at 65 degrees F. In the early stages of bronchitis, this kettle of boiling water seems to give much relief. One of the good old remedies used years ago was 1 fluid ounce turpentine in 1 pint of boiling water and inhaled. One ounce contains eight teaspoonsful.) In the case of an infant, this would have to be placed as close to the face as possible to allow the vapor to be breathed by the child. With older children, a pint of water, to which the turpentine has been added, in a bowl, over which a piece of cotton fitting around the edges has been placed is useful. Allow the child then to place its face over the other end of the cotton and inhale the vapor as it passs up thrugh the bag. Any clean cotton bag, with a tape or string run through the end, can be made to fit over a bowl or dish of some kind.

Poultices, in children, arranged so that the whole chest is encircled, are good. Th eidea of any poultice is to keep the heat in one place, so htat circulation will become improved, and good circulation means plenty of blood to counteract the poisonous effects of the toxines present.

Poultices and Plasters

In the case of children, if a mustard poultice is to be used; two teaspoons of flour anad one-half teaspoon of good strong mustard are sufficient. Always before applying the mustard poultice, rub oil over the part on which the poultice is to be placed, and no blisters will form. The oil may be in the form of vaseline, castor oil, lard, goose oil, camphorated oil, but do not forget the oil first. Mix the poultice with cold water. Warm water dissolves the oil of mustard from which the heating properties come. If you want to heat the plaster before applying, hold it over heat for a second or so, but not longer, because the heat is too drying.

How to Give a Mustard Bath in Emergencies

A mustard bath is also an excellent stimulant, and the body of the child becomes reddened as a result of the stimulation. The little patient is made comfortable. A tablespoonful of mustard is added to a gallon of water at 100 degrees to 105 degrees. The infant should be undressed. Cut the clothes off if necessary, but do not immerse with clothes on for the heat does not have the desired ffect, and there is a great probability of chills afterwards. Be sure to see that the whole of the body is covered by the water, for, if not, the child will be chilled by the exposure rather than stimulated by warmth. After remaining four minutes in the bath, the child should be quickly dried with a warm towel, wrapped in a hot bdanket and hot water bottles should be placed outside the blanket. The child should be kept very warm, but given plenty of air. Never cover the head.

BROWN BREAD

Mix together 1 cup corn-meal, 1 cup rolled oats, ground fine in food-grinder, and 1 of barley flour. Add 1 teaspoon salt, 1¾ cups milk, ¾ cup of molasses, and 1 teaspoon soda dissolved in 1 tablespoon water. Add raisins if desired. Mix well and steam 2½ hours. This quantity will make one smal loaf. Steam three and one-half hours.

CHEESE AND POTATO CAKES

Boil and mash eight or ten large potatoes. Rub the potatoes through a sieve and add two teaspoons of fat, a cup of sifted flour, a teaspoon of baking-powder, four tablespoons of grated cheese and salt and pepped to taste. Form into a light dough with two table spoons of milk and the yolks of two eggs. Shape in cakes, brush with white of egg, and bake in a quick oven until nicely browned.

BAKED TONGUE

Wash a medium sized beef tongue and boil in a large kettle of water, season with two teaspoons salt, one teaspoon pepper When the tongue is quite tender remove to a baking dish and cover with one can tomato soup, place in a hot oven and bake for fifteen minutes. Serve in the dish in which it was baked.

QUICK RAISIN BREAD

2 1/3 cups entire wheat flour.
½ cup fine corne meal.
2 tablespoons baking powder.
1½ teasponos salt.
¼ cup brown sugar.
1 egg, well beaten.
1¼ cups milk.
1 cup seeded raisins, cut in halves.

Mix and sift dry ingredients, add eggs and milk. Mix well and then add raisins. Put into a greased breadpan, cover and let stand twenty minptes. Bake in a moderate oven fifty to sixty minutes. Make one loaf.

A Stitch in Time

THERE is a homely old proverb which tells us that "a stitch in time saves nine."

If the man who said it first had been thinking of health, he would probably have said that a stitch in time saves nine hundred and ninety-nine, so important is it to repair those first tissues that become impaired by ill-health.

This is no new doctrine. It is as old as man. Unfortunately (to paraphrase another proverb), we too frequently put off until to-morrow what we ought to do to-day.

Failing to repair the first tissues that need repair, allowing the malady to continue unchecked, other tissues become impaired, for all parts of the body are sympathetic.

The trouble spreads. And—then comes the rent. Nervous disorders may show themselves in various ways, such as sleeplessness, headaches, neuralgic pains, nervous prostration and exhaustion, while later developments take the form of paralysis, locomotor ataxia, or some form of helplessness.

Strangely enough—all these symptoms are preventable, if that stitch had been taken in time. It is here that Dr. Chase's Nerve Food becomes important. We do not say that it is the only means of preventing the rent, but we do say that many years of experience have **proved** its value as a repairer of wasted nerve tissues that have become weakened by overwork, anxiety, or other causes.

When we say that the value of Dr. Chase's Nerve Food has been **proved** we are speaking by the book. We might, at considerable length, tell you why Dr. Chase's Nerve Food will make that stitch if taken in time and prevent the rent, but we have always proceeded upon the idea that people are more interested in knowing **what has been done** in cases similar to their own.

Mrs. W. T. Abbott, 536 Paterson street, Peterboro', Ont., writes: "My system was in a rundown condition, and I was troubled with nervousness and sleeplessness. For some time also I had been bothered with neuralgia, and although I tried many remedies, it was without success. Upon the advice of a friend I commenced using Dr. Chase's Nerve Food, and soon found that my neuralgia was cured, and I have not been troubled in this way since. I also find that now I can eat and sleep well, and I give full credit for this great benefit to Dr. Chase's Nerve Food. I might also mention that I had lost considerable in weight, but after using the Nerve Food I gained back the flesh I had lost."

You can obtain Dr. Chase's Nerve Food from any dealer at 50 cents a box, six for $2.75, or from Edmanson, Bates & Co., Ltd., Toronto.

MARKETS.

MONTREAL

THE CATTLE MARKET

Montreal, Fb. 15.—At the Canadian Pacific Liv Stock Market the offerings today amounted to 250 cattle, 200 sheep and lambs, 275 hogs and 175 calves. A feature of the trade at this market has been the continued demand from American buyers for supplies, notwithstanding the recent sharp advance in prices, and shipments of two carloads of lambs were made to New York and three carloads of cattle to Philadelphia. There was no further change in prices today for cattle, but the feeling was very firm owing to the limited supply offered and the scarcity of the top grades. The demand was steady from butchers for small lots to meet their requirements for the balance of the week and sale sof fairly good steers were made at $12.50 to $12.75, medium at $11.50 to $12 and the lower grades at from $8.50 to $10.50, while a few choice light cows sold at $10 to $10.25, and the commoner lots at from $7 to $9. The few butchers' bulls on the market brought from $6.50 to $8.50 per 100 lbs., but there were no choice lots. Canning bulls met with a steady demand at $5.50 to $6, and cows at $4.50 to $5 per 100 lbs.

A fair trade was done in small meats and prices generally were firmly maintained. Ontario lambs sold at $14 to $14.50 and Quebec stock at $13 to $13.50, while sheep brought from $6.50 to $10 per 100 lbs., as to quality. The supply of milk-fed calves was small, for which the competition between buyers was rather keen at from $10 to $16, and stall-fed stock sold at $6 to $8 per 100 lbs., as to size and qualitq. The market for hogs was exceedingly firm in sympathy with the further rise in prices at other Canadian centres and the continued small receipts here. The demand from packers was good and sales of selected lots were made at $17.25 to $17.50, and lots weighing less than 140 lbs. each at $15.25 to $15.50 per 100 lbs., weighed off cars. The bulk of the trading was done at the outside figures.

THE PROVISION MARKET

Montreal, Feb. 15.—In sympathy with the further advance in prices for live hogs in the Toronto market yesterday of 25c to 50c per 100 lbs. to $17.50 weighed off cars, and to $17 fed and watered, and the rise in the Winnipeg market of 50c per 100 lbs. for selected lots of $16.25 weighed off cars a very firm feeling prevailed in the local market today, but prices showed no actual change. The offerings were small, for which the demand from packers was good, and sales of selected lots were made at $17.25 to $17.50, and olts weighing less than 140 each at $15.25 to $15.50 per 100 lbs, weighed off cars. Owing to the above the market for dressed hogs was also firm with an increased demand for supplies, and a fairly active trade was done in a jobbing way in country dressed medium and light weights at $21 to $23, and in city abattoir freshkilled stock at $24 per 100 lbs.

MILLFEED AND ROLLED OATS

Montreal, Feb. 15.—The condition of the market for millfeed was unchanged, prices for all lines being maintained with a steady business passing in mixed car lots for local and outside account and sales of pure grain moullie were made at $64, pure oat moullie at $60 to $62, pure barley feed at $50 to $52, mixed grain moullie at $47, and dairy feed at $43 per ton, including bags, delivered to the trade, and small lots of bran sold at $38.75, and shorts at $43.75 per ton ex-warehouse, including cartage, with car lots of bran quoted at $37.25, and shorts at $42.25 per ton, ex-track, all less 25c per ton for spot cash. The markee for rolled oats continues quiet with an unsettled feeling and prices for standard grades are nominally quoted for broken lots at $3.90 to $4.10 per bag of 90 lbs., and Golden cornmeal is selling at $4.75 to $5 per bag delivered to the trade.

ORIENTAL EGGS FOR MONTREAL MARKET

February 15th.

The Canadian egg markets during the week have been governed almost exclusively by the trend of the situation in the United States. There has not been anything like the wide break in prces that there was in the States during the earlier part of the week, because it required a big drop there before importations could be made on a profitable basis. This came a week ago Saturday, when several lots were bought by Canadian dealers at Detroit and Chicago, which it was figured would cost about 50½c to 51c delivered at Toronto, all charges paid. Monday further weakness developed at Chicago, and a number of cars were purchased, which it was estimated would cost about 42½c if brought by freight and 45½c by express. Since then a much firmer feeling ahs developed in that market. Very little grading is being done now. The arrivals being practically all new-laids, and are sold straight with the exception of a few from specialized poultry farms and egg circles.

No severe fluctuations have occurred in Western Canada. There has been a general decline in sympathy with the United States markets, but the amount of stock already purchased at previous prices tended to keep the situation firm. The cold wave last week checked receipts somewhat on the principal markets. The bulk of the imported eggs continue to arrive by express. So far the small

SHERWIN-WILLIAMS INSECTICIDES

M-S

COVER THE EARTH

Make A Good Job of Your Spraying!

SHERWIN-WILLIAMS Insecticides are absolutely dependable in *every* instance. You cannot get better—there are none better made. And in your spraying, be *thorough.* Use all the materials required—and use them as directed on the packages—*SHERWIN-WILLIAMS* Insecticides are certain death to the bugs, and you cannot afford to take chances. Here is a list of them,—

S-W Dry Powdered Arsenate of Lead

Can be kept from year to year. Will not freeze or evaporate. 1-lb. does the work of 2-lbs. of paste.

S-W New Process Arsenate of Lead (in paste)

Neutral—will not burn or hurt even the tenderest foliage.

Berger's Pure Paris Green

Sure death to potato bugs. The Standard Paris Green for years—up to Government standard in every way.

S-W Calpoiso-Arsenate of Lime

A Dry Powder. The best to mix with Lime Sulphur or Bordeaux Mixture.

S-W Dry Lime Sulfur

A Powder to be mixed with water. Lasts for years. No freight to pay on water as is the case with solutions.

S-W Insecto

Arsenate of Lead combined with Bordeaux Mixture to spray garden and orchard.

S-W Tuber-Tonic

Kills bugs and fungus on potatoes. In dry form.

Write us for our spraying guide. Also for any further information regarding the above material.

USTRALIAN WHEAT GROWERS

A recent estimate made by the Aus- alian Wheat Board anticipated that e surplus from the 1918-19 wheat op, added to the carry-over from pre- ous seasons, would aggregate 165,- 6,000 bushels, or approximately 4,- 7,000 tons of wheat (to a limited tent milled into flour) and flour be- g available for export. It is announc- that many steamers have been re- ased to load the purchases made by British Government, which, how- er, did not buy any of the 1917-18 op upon which the Commonwealth overnment advances now total over 11,000,000.

Independent of the earlier guaran- es made by several State Govern- ents (owing to the Federal Govern- ents not having come to a decision the matter) the Prime Minister an- unced on December 19 that the mmonwealth Government had de- ded to make an immediate advance 4s (97 cents) per bushel to the rmers on the 1918-19 wheat crop of cognized quality. This guarantee mediately relieved the State Gov- nment from any liability in making vances to farmers.

The advance will involve a payment about £13,000,000 in addition to ilway freight and all expenses in ndling. This expenditure will grant ompt relief to wheat growers who, rough an unfavorable season, will ve a much restricted production.

WINNIPEG GRAIN MARKET

February 15.—Oats closed 7/8c high- for May and 5/8c higher for July. arley closed 1 1/8c higher for May and higher for July. Flax closed 1/4c gher for May.

Fluctuations in grain today were:

	Open.	High.	Low.	Close.
Oats—				
ay	66½	67¼	66⅜	67¼
Barley—				
ay	84⅜	85⅜	84⅜	85⅜

Cash prices closed:

Oats—No. 2 C.W., 68¼c; No. 3 C.W., ¼c; extra No. 1 feed, 63¼c; No 1 ed, 59¾c; No. 2 feed, 55¾c.

Barley—No. 3 C.W., 81⅝c; No. 4 W., 76⅝; rejected and feed, 69⅜c.

ax—No. 1 N.W.C., $3.04½; No 2 W., $3.01½c; No. 3 C.W., $2.81½.

DAIRY PRODUCE TRADE

February 15.—The receipts of but- r today were 94 packages, as com- ared with 86 for the same day last eek, and 46 for the corresponding date a year ago. There were no new developmnts of any importance in the market to note. The trade in a whole- sale way was reported quiet, there be- ing only a small demand at present for round lots, but the movement in a jobbing way continues fair and pric- es are fully maintained.

We quote wholesale jobbing prices as follows:

Finest creamery, solids.51½c to 52c
Finest creamery, blocks 52½c to 53c
Fine creamery, solids...51c to 51½c
Finest dairy.....43c to 44c
Fine dairy.....42c to 42½c

The receipts of cheese today were 8 boxes, as against 9 for the same day last week, and 45 for the correspond- ing date a year ago. There was a lit- tle more enquiry today from local buy- ers for Quebec twins and sales of sev- eral fair-sized lots were made at 26½c to 27c per lb.

The following prices are being paid by the Commission:

No. 1 cheese.....25c
No. 2 cheese.....25½c
No. 3 cheese.....24c

THE BALED HAY MARKET

Montreal, Feb. 15.—The market for baled hay was rather quiet today, ow- ing to the fact that buyers in most cases seem to have ample supplies on hand for the present and in conse- quence the demand was somewhat lim- ited, but the tone was steady and prices were unchanged with car lots of No. 1 timothy hay quoted at $25, No. 1 light clover mixed hay at $24, No. 2 timothy hay at $24, No. 2 clover mixed hay at $23, and No. 3 timothy hay at $22 per ton ex-track.

Efficient management in the farm home is quite as essential to the suc- cess of the farm as is the systematic management of the farm itself.

FEEDING CATTLE IN NOVA SCOTIA

(Continued from page 569)

will not need much, or any grain if they are given an abundance of green feed, either from soiling crops, or from a good pasture. Cows giving over 30 lbs. daily will need some grain in order to keep the milk flow up to the maximum.

Another advantage gained from grain when the pastures are rather short is the better condition in which the cow goes into the barn in the fall. This enables her to do better work during the winter and even during the whole of the next period of lactation. A cow that is allowed to get very thin and freshens in that condition, will never give as much milk as if she had freshened in good condition.

In the College barn the cows are not fed in the morning until after they are milked, then they are given half the grain and turnips allowed in the ration for the day. When this is eaten up they are given all the hay they will eat up clean. If they are getting silage instead of turnips it is given first after milking with the grain scattered on top. After this morning feed they are not fed again until after they are milked in the afternoon. Milking begins about 4.30 p. m., and they have all their feed before them by 6 o'clock. Cows that are milked 3 times daily are given grain 3 times. By this method of feeding, the cows get all they can eat twice daily and are left in quietness the rest of the time.

Especial care should be given the cows at calving time. They should have at least six week's rest from the time of drying off until freshening again. The grain ration should not be stopped at this time. They need about the same amount (say 6 to 8 lbs.) and about the same mixture as they would receive if they were giving 25 lbs. of milk. This gets them in shape for the work of the next lactation period and is feed wisely used.

About ten days before freshening they should be given succulent food as far as possible. The only grain that it is wise to feed at this time is wheat bran. This can be fed in liberal amounts right up to calving time. The bran is loosening and cooling in its effects upon the system, and prepares the cow for the dropping of her calf. Furthermore, wheat bran contains a large amount of ash, and other material that is good for the developing calf.

At calving time the cow should be placed in a comfortable well bedded box stall. As soon as the calf is born the cow should be given all the warm water she will drink. This will help to keep her from having a chill, and make it much more likely that the afterbirth will be properly expelled. The box stall should be furnished with plenty of fresh dry bedding after the calf has arrived and the cow and calf not left in wet cold quarters.

The cow should be fed wheat bran for the first few days after calving and not much heavy grain given until the swelling, or cakeing is pretty well out of the udder. A large amount of cakeing is not harmful if the cow is not overfed until it subsides. In fact a much swollen udder indicates a good milker and is a welcome sight to the observant dairyman. The swelling may extend along the underside of the belly without indicating anything wrong.

In feeding the Dairy Calf the first food given should consist of the mother's milk. If the cow is a heavy milker the calf may easily get too much if allowed to suck all it wants. Light feeding for the first week or two should be the invariable rule. It may be allowed to suck for a day or two, or until the milk is good for use, at the end of four or five days. After that it should be fed from the pail preferably three times daily until it is two weeks old. A small amount at each feed is the rule, not more than a quart at a time fo rthe first ten days. After that, part skim milk may be substituted for whole milk, and by the time it is three weeks old all skim milk may be given.

At this time some fine hay and grain should be given in addition to the skim milk. A little fine mixed hay should be put in a rack fresh every day, where the calf can reach it easily. A grain mixture should be made up of equal parts of bran, middlings, ground oats and one quarter part of oil meal. A small handful of this mixture may be given daily until the calf learns to eat it with relish. The meal should be put in a box dry after the calf has had its milk, as it will be masticated better and be more useful to the calf if it is fed dry. Great care should be taken to keep the feed box clean and fresh, also all pails used in feeding should be cleaned thoroughly every day. The amount of grain fed may be increased gradually until by the time the calf is three months old it is getting some two pounds or more of the mixture per day. The skim milk may be increased to eight quarts per day given in two feeds.

The importance of feeding calves liberally the first year cannot be too strongly emphasized. If the calf is not fed enough to make it grow well the first year it will always be under sized. It is a better practise to feed some grain the first year and none the second than to feed none the first year and attempt to make it up by feeding heavily the second year. More returns in growth will be obtained by feeding grain to th animal when it is young than at any other time.

PROVINCIAL POULTRY SHOW AWARRDS

(Continued from page 573)

Dresed Poultry: Bertrand Goodspeed, 1st.

Special Prizes

Cup donated by Mr. A. C. McCullock, poultry superintendent, for largest and best display of Utility B. P. Rocks: Won by Hugh McMonagle.

Silver, cup donated by Mr. James S. Neill, honorary vice-president of the York County Poultry Association, for the largest and best display of exhibition Plymouth Rocks, Wyandottes or Rhode Island Reds: Won by P. L. Morgan, North Devon.

Gent's Club Bag, donated by C. H. Thomas & Co., for the best cockerel in the Mediterranean classes: Won by Odbur James, Moncton.

Pair of Hartt Shoes, donated by the Hartt Boot & Shoe Co., Fredericton, for the best male bird: Won by P. L. Morgan.

Pair of Palmer's Oil Tanned Shoepacks, donated by the John Palmer Co. Ltd., for the best female bird: Won by P. L. Morgan.

Bron e medal, donated by the Canadian Poultry Review, Toronto, Ont., for the best pen of birds at the show: Won by P. L. Morgan, North Devon.

Setting of Ancona eggs, donated by J. W. Stickles for the best display of Anconas: Won by J. W. Stickles.

Twenty-five pounds of bone meal, donated by Morgan & Co., for the best pen of Anconas: Won by J. W. Stickles.

White Leghorn cockerel, donated by J. N. Ferguson for the best White Leghorn cockerel failing to win a prize: Won by A. D. Gunter.

Setting of Owen Farm Rhode Island Reds for the best male S. C. Rhode Island Red shown by a new exhibitor: Won by F. D. Dibb, Fredericton.

Setting of exhibition Plymouth Rocks, donated by John E. Page, for the best display of exhibition B. P. Rocks by an amateur breeder: Won by W. H. Allen.

Packages of Pratt's Poultry Remedies, donated by the Pratt Food C., Toronto, were won by the following: J. N. Ferguson, W. S. Bailey, Fredericton; James W. Stickles, North Devon; Watson Lutz, Moncton; Mary Stickles.

$1000 MAPLE SYRUP PRIZE CONTEST

FOR MAPLE SYRUP AND SUGAR

Every maker of Maple goods in Eastern Canada should be interested in this remarkable contest. It will help all makers of Sugars and Syrup on the Grimm Champion Evaporator to have an expert opinion of their goods, whether they win a prize or not. The GRIMM CHAMPION OUTFIT is built with one idea—the best syrup and Sugar at the least cost. Start wtih good, clean sap and the Grimm Champion does the rest. Put a Champion in your grove as early as possible. We can give you the right size at the right price. Write

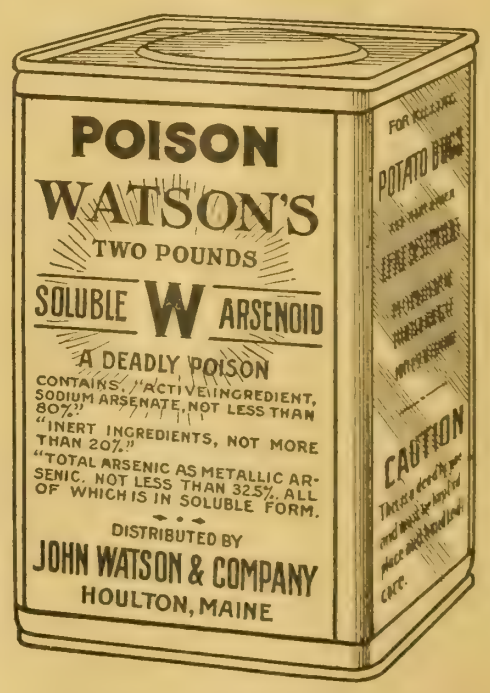
WATSON'S SOLUBLE ARSENOID



POISON
WATSON'S
TWO POUNDS
SOLUBLE W ARSENOID
A DEADLY POISON
CONTAINS: "ACTIVE INGREDIENT, SODIUM ARSENATE, NOT LESS THAN 80%"
"INERT INGREDIENTS, NOT MORE THAN 20%"
"TOTAL ARSENIC AS METALLIC ARSENIC, NOT LESS THAN 32.5%. ALL OF WHICH IS IN SOLUBLE FORM."
DISTRIBUTED BY
JOHN WATSON & COMPANY
HOULTON, MAINE
FOR POTATO BUGS
CAUTION

One pound does the work of two of Paris Green, and does it better. It's first cost is far less than Paris Green. WATSON'S SOLUBLE ARSENOID is now recognized to be far the most efficient insecticide for killing potato bugs and other leaf eating insects.

It must be used with bordeaux mixture, and not otherwise. It is very adhesive and does not wash off easily.

FREE OF DUTY except the war tax.

On July 22, 1918, the Canadian Customs at Ottawa issued an order removing the duty on WATSON'S SOLUBLE ARSENOID except the war tax, and this order applies only to WATSON'S SOLUBLE ARSENOID, manufactured by John Watson and Company, Houlton, Maine. This endorsement speaks for itself.

WATSON'S SOLUBLE ARSENOID has been on the market for a number of years and is used almost exclusively in Aroostook County. If your dealer cannot supply you, write us direct, and give us the name of your dealer.

JOHN WATSON AND COMPANY,
HOULTON, MAINE, U. S. A.

Neales, Hartland; Evo Poiried, St. Louis.

Four ribbons offered by the White Wyandotte Club for the best cock, hen, cockerel and pullet were won by P. L. Morgan.

Four ribbons offered by the Buff Wyandotte Club were won by W. S. Swetnam, Moncton.

Gold Medals for Brown Legohrns, donated by the American S. C. Brown Leghorn Club, were won by Hugh McMonagle (2) and Rudolph I. Wilson.

Five one-pound packages of Red Rose Tea, donated by T.H. Estabrooks Ltd., of St. John, were won by J. N. Ferguson.

Silver cups, open for competition to members of the Westmorland Poultry and Pet Stock Association were won as follows

Riley silver cup for best cock, hen, cockerel and pullet, any variety Leghor, except S. C. White: Won by Hugh McMonagle for the second time.

Dominion Poultry Guide Silver Cup for the best cock, hen cockerel and pullet, S. C. Rhode Island Red: Won by W. S. Bailey, Fredericton, for the second time.

The Maritime Poultry Supply Co.'s silver cup for best pair of Cochin bantams: Won by C. H. Smythe, of Moncton, for the third time.

Reed & Co.'s silver cup for the best cock, hen, cockerel and pullet, S. C. White Leghorns: Won by J. N. Ferguson, Fredericton, for the second time.

National White Wyandotte cup for best cock, hen, cockerel and pullet: Won by P. L. Morgan, North Devon.

HOLDING THE ROAD

It is often said that a car "holds the road well," but the meaning of this phrase seems never to have been exactly defined, so that it does not convey the same ideas to everyone. Probably it usually means that the wheels of the car remain in constant contact with the road surface, that is, that they do not bounce, but sometimes it means that they remain in constant contact with the road in the direction of travel, that is, that they neither bounce nor slip. Perhaps the chief cause of the wheels boucing away from road contact is the inertia of the wheels, axles and other unsprung parts of the cas which is a matter of their weight. A weightless running gear would follow road irregularities perfectly. For this reason, the lighter double-chain driven rear end has been preferred by race drivers rather than the heavier gear-driven system. Another cause of bouncing is the failure of the tires to flatten and absorb the smaller road irregularities and this accounts for the fact that a car with hard tires doesn't hold the road well. The action of the springs so far as it interferes with the wheels following road irregularities, conduces to boucing. Extreme reduction of the load, below that which it is designed to carry, aggravates the bouncing tendency and reduces a car's ability to hold the road well. A very low hung car, one posessing a very loy center of gravity, is supposed to hold the road especially well, but it is not plain why this should be the case although such a car is obviously more free from body sway an dthe liability of overturning.

One Clutch Acts Violently

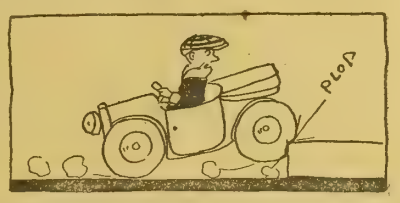
D. W. Asks: What makes the clutch of my car work jerkily, although I release he pedal as gently as I can? This is a cone clutch and until lately it would start the car gently, but of late its action has been growing worse.

Answer: Many con clutches have springs acting between the clutch member and the lining to force the latter outwardly, and ithese are not acting properly, the clutch is likely to engage fully with the lightest contact and "grab" violently. If the lining is of asbestos material and has become roughened up, the same effect may be produced. If it is of leather, it may have become hard and unpliiable, in which case it will give trouble. A dressing of neatsfoot oil will sometimes improve a leather lining unless it has been worn too th in or is badly burned.

Should This Tire Be Repaired?

C. R. D. writes: I backed my car at quite a speed, into a stone curb on a dark night recently. Fortunately the only damage was the bursting of one of the rear tires. Will it pay to have this tire repaired or is it ruined?

Answer: If this tire was practicly a new one, as to length of service and was in good condition up to the time of the accident, with a reasonable expectation of its delivering a

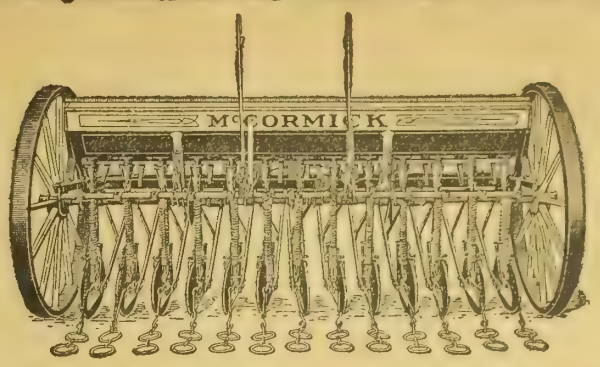


substantial mileage, we should advise you to have it repaired by vulcanizing in a new section to take the place of the damaged part. If, on the contrary, it was an old one and had delivered a large parts of its expected service, we should advise your discarding it. You should credit it with having saved its wheel from destruction. Any fair-minded tire repairman can tell you what to do with this tire better than we can.

Starting Fluids

C. J. H. writes: I have considerable trouble starting my engine on cold mornings. Can you tell me anything as to the merits of the "starting flids," which have been placed upon the market?

Answer: We imagine that they are all right as it is a very easy matter to put up high test gasoline or sell the product under this name.



Buy a McCormick Drill

BECAUSE drill-planted seed gets an earlier, more even start — because drill planting saves seed and produces a better grade of grain — because drill planting saves time and work — and because the **McCormick** drill is one from which you get all these advantages, buy a **McCormick** drill.

The **McCormick** comes in single disk and hoe styles, 11 and 13 marker sizes. All have the famous double-run feed which handles accurately both large grain and small, from peas and beans down to flax, planting any desired quantity per acre, planting it evenly, and covering it to just the right depth. Your crop could not get a better start than the one given to it by a **McCormick** drill.

See the **McCormick** local dealer when you are ready to buy. He will show you all the details of construction that put the **McCormick** drill at the head of its class. Or, if you write the nearest branch house below, we will send you full information.

Started With $500 Now Has $35,000

It is related that a Massachusetts man starting in 1903 with only $500, has by systematic saving and compounding interest and dividends, built up an investment of $35,000. Wherein does this man differ from the ordinary individual? What do you think is the underlynig secret of his success? And do you think he is gifted with more than the average brains?

Is not the success which has smiled on him due almost, if not entirely, to that one feature: Systematic Saving?

That is the kind of saving that counts.

That is the kind of saving that gives power.

That is the kind of saving that brings independence.

But such saving requires a plan, a definite, capable plan.

Such a plan as we can offer you (a post card will bring it) at any time.

Real Systematic Investment provided it is in good bonds and stocks is our specialty.

Write us your requirements and we will send you the plan which will set you on the high road to financial independence.

SOME OF THE PROBLEMS WHICH CO-OPERATION HAS NOT SOLVED

(Continued from page 591)

Some companies enact stringent by-laws against disloyalty, carrying with them heavy penalties, but as a rule these penalities are never imposed, the company depending upon self-interest and moral ties to keep its members together.

Co-operation has been thus far no more successful than other organizations in dealing with the human element.

Such are sme of the problems which has shown co-operation its limitations. Such limitation are, of course, no argument aganist co-operaton, nor are they yet a probability of its downfall, but recognized they serve a useful purpose in calling attention to the sphere within which the varied activities of the movement may most profitably be conducted.

DAIRY SHOW AND ORGANIZATION MEETING

The attention of New Brunswick Dairymen is called to a meeting which will be held in the Agricultural Build-in, Sussex, on March 7th.

Delegates representing the cheese factory patrons, creamery patrons, chese factory and creamery owners, cheese makers, butter makers, milk and cream shippers and wholesalers are expected to be present and an effort will be made to effect such an organization of the various branches of the Dairy industry as will be thoroughly represetnative.

The exhibit of cheese representing the August and September makes from 20 different factories will be a feature of the gathering. These will be scored by Mr. Geo. H. Barr of the Dairy Division, Ottawa, and the prize money provided by the local department divided pro rata first and second grade cheese. In addition several prizes have been made available through the kindness of several cheese dealers and other individuals.

Questions of importance to the trade will be discussed and action taken thereon. Among these may be mentioned: Co-operative purchase of supplies, improvement in methods of selling, new standards for grading cheese, representation on National Dairy Council and Dairy Herd Competitions.

A cordial invitation is extended to all interested who possibly can do so, to attend, whether delegates or not. The morning session will open at 10 o'clock when the result of the cheese scores will be announced. Afternoon will be given over to discussion of various topics and organization.

THANKS THE C. N. R. OPERATING STAFF

Chairman of Imperial Munitions Board Appreciates Good Work in Connection with Special Traffic Movements

Writing to Mr. F. P. Brady, General Manager of the Canadian National Railways, Eastern Lines, Sir Joseph Flavelle, Chairman of the Imperial Munitions Board at Ottawa, expressed himself as follows:—

"The work of the Imperial Munitions Board at Ottawa is complete. With the exception of a few officers of the Records Department who will remain here, the members of the staff necessary for the completion of the liquidation of our assets, will move to Toronto.

Before leaving Ottawa, I desire to express my great appreciation of the assistance given the Board by the entire operating staff of the Intercolonial Railway. You will readily understand that many times during the last three years we have asked officers of the Company to give special consideration to the movement of traffic, and in all cases we have met with generous response."

This is an acknowledgement from Mr. Flavelle of the excellent work done by the Canadian Government Railways in the matter of traffic movements during the most trying periods of war time, when special attention was given to overseas munition shipments.

Potato Spraying

Changed from a Big Job to a Small One

PROPER spraying may save you the cost of acres of potatoes this year. Our sprayers cut down both work and time, leaving you not a reason in the world for taking a chance on bugs and blight. It turns this big job into a little one and leaves you extra time for other things and for spraying oftener. You can have time to spray *to prevent* bugs and early and late blight.

O-K SPRA

Here is without a doubt the surest, most convenient and most durable hand sprayer ever invented. It is equipped with the "Efficiency" non-clog nozzle, which has a thimble-shaped strainer, and will keep in action longer without attention than any other type. Its shape prevents clogging.

Take a look at the curved lance. (See picture.) It saves many a backache! It lets you get the nozzle under the leaves without bending your back.

The non-clog nozzle and curved lance enable you to use the O-K Spra for trees, shrubs, vines, bushes, or for disinfecting barns and hen coops, or for applying oils and washes to stock. Certainly no farmer could be persuaded to give up its use once he has had this all around handy and effective sprayer in use.

O-K Canadian 2-row Sprayer

For small acreages it certainly is a surprising time saver. It does the work as fast as you could run a wheelbarrow over your crop. It is used like a wheelbarrow and is just as easy to operate between rows. If need be a horse can be used for heavy ground. It sprays two rows at a time and there is no stopping for adjustments once it is set for width of rows. It throws out a fine plentiful mist that reaches every fold or surface on the plants, two rows at once. The discharge pipe can be detached for spraying trees, etc. and may be adjusted instantly for both height and width of rows. Tank holds 10 gallons. Write for full particulars.

O-K Canadian 2-row Sprayer

O-K Canadian 4-row Sprayer

Think of spraying an acre of potatoes in twenty minutes! It works like a charm even on heaviest land, spraying efficiently four rows at a time. One horse pulls it easily and the driver can watch every operation. There is easy access to all controls. Write for booklet.

Time is Precious

If you leave off buying until your busy time you might put it off again—and lose far more than the cost of the machine. Write us for free literature with full descriptions and valuable information about bug poisons, fungicides, etc. Let us tell you how you can do your spraying in quick time and how to mix spraying materials.

A BOOK ON BARN BUILDING

If you are thinking of building a new barn or remodelling your present one, you cannot do better than write Beatty Bros. Limited, for a copy of their 352 page "Barn Book". It will not only help you now, but act as a book of reference for your future problems.

How to lay out your stable; how to ventilate and light it; how to lay cement floors and the amount of material required; how to frame the barn; the comparative advantages of plank frame and solid timber; the best designs for cow stables, horse stables, and hog pens; silos and how to build them; these, and practically any other points which may be perplexing you, are covered in this well illustrated, carefully written book. It would pay any farmer well, to write to Beatty Bros. Limited, for a copy. It is free to any farmer intending to build or remodel.

CHEAP HOUSING AND LABOR SAVING IN THE WINTER FATTENING OF SWINE

(Experimental Farms Note)

One of the most common losses in conection with winter swine management is due to crippling or rheumatism. That this malady easy to contract and difficult to overcome, may be practical eliminater, or rather, prevented, in breeding stock, wintered out-of-doors with open shelters, has been demonstrated without doubt. No ill effect has croped up to offset this advantage. With several individuals in a small, well-bedded cabin, there is no apparent discomfort to the inmates even during the most rigorous months of the Canadian winter.

The fattening hog, heavily fed, required to make maximum gains in minimum time, would seem to require warm quarters. The energy required to offset cold would thereby be utilized for growth and fat production. Less feed would be required. While the latter premise proves true, the fact of the matter is that the swine feeder is confronted with the choice of two apparent evils,—a com-

paratively cold house, that because of its nature, is practically like out-doors and there foredry, or a more expensive, tightly-built, warmer structure, that, even if ventilated, usually proves more or les damp. Cripplings in hogs will appear to a greater or lesser degree under bod or good management. Damp quarters undoubtedly predispose to it. Add to this, heavy feeding, with occasional over-feeding, and the result is frequently that of several more or less cripled pigs, the whole or partial losses from which will seriously affect the winter's profits. On the other hand it has now been pretty well proven at several points in the Experimental Farm System that such losses from outdoor-fattened hogs are practically negligible and that the evidence of thrift and quality resultant, very greatly over balances the extra cost of outdoor feeding. Cold air in itself should have no virtue. Nevertheless, the open-air hog is more vigorous and healthy than the one fed in warm, dry quarters. Constantly pure air and a certain amount of exercise would seem to be responsible.

Very little capital need, then, be tied up in winter swine feeding quarters. A low sleeping berth made of old boards and covered with straw within or near a shed for feeding purposes, is necessary. While a straw stack is frequently used for shelter, the above arrangement is better. Access to a pile of horse manure in the shed will provide a certain amount of food and exercise and a very considerable amount of recreation for the hogs. Such an arrangement, as discussed, provides a dry, comfortable bed, a difficult acquisition in the fairly expensive building.

The use of the self-feeder during winter has also proven a success. The feeder or feeders must be protected by a shed, as suggested. There is no trouble from frozen troughs and the general inconvenience and waste of slop-feeding in winter. Much disagreeable labor in cold is avoided; in fact, the man who has used the self-feeder for winter work finds it even more of a convenience than it proves in summer. As to grains and cost-to-produce, tests have proven it usually superior to the hand-feeding method. Whole, cracked, or ground corn, ground barley or barley and oats may be fed. Shorts, bran, recleaned screenings, etc., may be mixed with the above, or following the American plan, fed separately in compartments. Where corn enters heavily into the ration, tankage should be fed in a compartment by itself. Charcoal, woodashes, slaked lime, salt, etc., or a mixture of these should be available. If nothing better, supply plenty of ashes, both coal and wood. Where dairy by-products are not available, water, preferably slightly warmed, must be supplied. Some form of watering device including a tank heater, home-made, or purchased, will prove useful where many hogs are kept. A rough rack along one side of the shed near the trough or feeder should be kept filled with well-cured clover or alfalfa hay. Enough of it will be eaten to help balance the meal ration, supply necessary and palatable roughage and materialy reduce costs.

CLEAN UP FARM TOOLS WHEN NOT IN USE

During the rush of fall work it frequently becomes necessary temporarily to lay aside tools used in connection with field work, awaiting a slack time to properly shed them for winter. I know how great the tendency is to let them stand out in the fields or in the barnyard well onto winter, and even if they are under shelter they are not fit condition for winter storing.

The disk harrow is covered with dirt and mud. If left in this condition it will colect a deal of rust and hours of work in the spring will be required before the disks will scour properly. Two hours of time spent in scraping and oiling the disks will be amply repaid in time saved in the spring. Have you had the disks on your harrow sharpened recently? It is but a short task to remove them and costs but little to have them sharpened. Do it yourself if you have an emery wheel. This not only makes the harrow more efficient, but very materially reduces wear and tear on bearings and frame. Don't neglect this important little thing.

THE GARDEN SEEDS

It is none too soon to begin to think of guying garden seeds. Last year there was a shortage of a good many kinds of seeds. Wo do not know how the supply is this year but it is always safe to order them early to insure getting what is wanted. Send to all the seed dealers and get their catalogues and study them this winter weather. Plan the garden now and try to have a better one than ever before. It is important to have good seeds and to get them aarly.

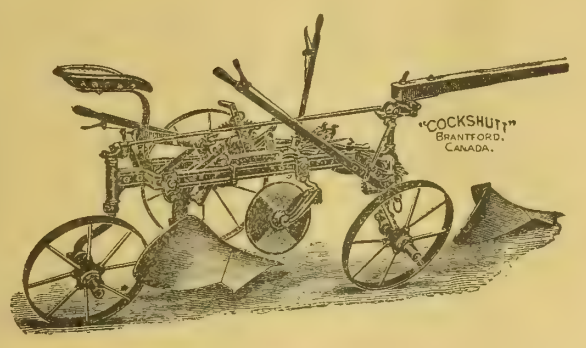
Don't mistake habit for character. Men with the most character have the fewest habits.

SEED CATALOGUES

February and March are the months when definite garden work begins. The garden plans may be gone over carefully and seed purchased for the summer's use. One of the best helps in this work are the seed catalogs. These vary in size and make-up. Nearly all contain good cultural information as well as a description of varieties. It is a good plan to send for a number of the better catalogs and study them carefully during the winter evenings.

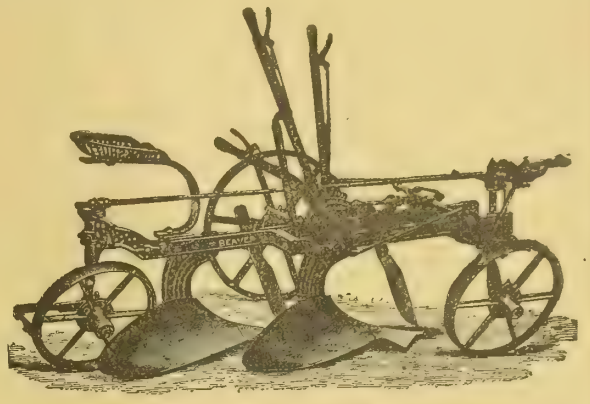
GOOD FARMING STARTS WITH GOOD PLOWING

The farmer who wants to get his plowing done quicker, easier and generally better than with the Walking Plow will find exactly what he needs in one of these two very popular Cockshutt Plows. They are famous for light draft, experienced design and high grade materials.



"FOOTLIFT" SULKY PLOW

No need to "favor" this Plow—put it at your toughest field and see how even an inexperienced worker will turn up nice, even furrows all day long. The Footlift feature is very convenient, raising or lowering the bottom by simple foot presure only. Immensely strong yet light in draft through high grade bearings and sensible design.



"BEAVER" GANG PLOW

Many years of splendid satisfaction is the report from hundreds of owners of this famous Plow. Very convenient levers control all its workings and when once set and started it's a real pleasure to watch the smooth uniform furrows it makes. Very valuable for thorough plowing in rough uneven ground. Strong, rigid, won't pull out of shape, yet very light in draft.

Write our nearest Branch for Catalogue and talk over any Implement requirement with the nearest Frost & Wood Agent. His Knowledge and suggestions will be valuable to you.

FIRSHADE FARM
DUAL PURPOSE SHORTHORNS
Present Offering:—Two Bull Calves

No. 1.—Son of Daisy Lodge, R. O. P. 11,638 lbs. milk, 480 lbs. fat. This cow led the four-year-old class in the Canadian Record of Performance.

No. 2.—Son of Queen Charlotte. She as a two-year-old has a R. O. P. of 7224 lbs. milk, 316 lbs. fat. This cow stands eighth in milk and sixth in fat production in the two-year old class.

The sire of these calves is Nivelle, whose dam as a two-year-old has a R. O. P. of 5496 lbs. of milk, 240 lbs. fat in 295 days.

P. R. L. FAIRWEATHER, Rothesay, N.B

DAIRY COW SUPREME

Two facts stand out prominently as reasons for the increased production and use of milk. The first is that milk as purchased on the market usually supplies food material together with the growth-producing elements more economically than either meat or eggs. The second reason is that the dairy cow is the most economical producer of animtl food. One great law of food conservation is to turn inedible feeds into edible foods in the cheapest possible. The dairy cow will utilize the coarse materials inedible to humans —such as grass, corn stalks, hay, etc. —and will turn them into milk. Other farm animals also are converters of coarse roughage into edible foods, but are not so efficient as the dairy cow.

BREEDERS' DIRECTORY

Our charge for inserting names in this Directory is $2.00 per year for each line under each heading. Money must be paid strictly in advance. Names taken out promptly when time is up Stamps taken.

Co-Operative Bull Associations

Joel G. Winkjer, in Hoard's Dairyman

"DeWitt is my name. My neighbors, when they get chummy, call me Do-it. I came over this morning for some information on a problem I have in running my farm. I have seen that much information is given out by the government, and when I came here and asked for information regarding the purchase of a pure-bred bull for my dairy herd, I was directed to you."

"Glad to meet you, Mr. Dewitt. Do-it is my middle name; therefore I have no doubt we shall get along nicely. Have a chair. How much of a farm have you, Mr. Dewitt, and what is your line of farming?"

"Well, now, let me tell you my story. I lived in the city, but quit my job, sold the house I owned, and bought a hundred-acre farm near the same place Tom Moore is from. You know Tom Moore, don't you?"

"Yes, know him well."

"I have gone into farming, and from my reading I came to the conclusion that in order to do general farming successfully it was necessary to include dairying. I started with two cows, and now have six. It is my plan to have ten or a dozen. I am now considering the purchase of a pure-bred bull and have come for advice. You see, up to this time I have used my neighbor's bulls. The first two years I went over to Bellew's Creek District for one. Almost five miles over there, and at that it was only a scrub bull. The next year I went across the hill to Dick George's Guernsey bull. He was nearer, and Dick had been told it was a thoroughbred. Dick could not use him any longer because he did not want to inbreed, and besides the bull showed signs of being ugly; and he was not going to get another one."

"Now, lately, a neighbor about two miles off has let me use his grade Holstein. This bull also showed signs of getting ugly and he sold him to the butcher. My cows are all grade cows. I would like to know if it would pay me to buy a pure-berd bull, and what can I buy one for?"

"These are puzzling questions, Mr. Dewitt. I know pure-bred bulls to have been given away, and there is also record of one being sold for $106,000. It is not uncommon to hear of bulls selling for $10,000."

"Ten thousand dollars! Why, my whole farm is not worth that much. If I bought one for that price I would have to sell my farm to raise the money, and I would have no farm to keep my bull on. I have no doubt I could raise such a bull, and also use the money that it sells for, but just now I havs only about $175 or $200 that I might put into a pure-bred bull if it is good business to do so."

"You say you have $200 to invest in a pure-bred bull. Now let us see what that means in your case. In addition to your first investment comes the cost of keep. What will it cost you to properly feed and care for a bull a year?"

"According to prevailing prices I could not do that for any less than $75 a year."

"You can keep your bull two years, then you have to dispose of him and buy another bull. That means that the cost of the bull and care for two years amounts to $350. The money you get for your bull when you sell him at the end of two years must be substracted from this. The question is, what will your bull sell for at the end of two years? If you have kept yearly production records of your cows you will be in a position to tell, when you get a similar record of the daughters, if your bull is any good. But here is the rub, it will take two years more before you can know the daughters' yearly production. It costs you $75 a year to keep a bull, so it is out of the question for you to keep him more than two years. You will have to sell him and the one who buys the bull doesn't know any more about him than you do, so the chances are you sell him for beef prices. He may be worth more than a thousand dollars but no one knows, and so it happens over and over again that you hear some dairy farmer refer to the good bull he once had, but when he tried to get him back he found the bull had been butcheerd. We are, therefore, up against the proposition of selling the bull for beef prices. What do you think he will sell for, Mr. Dewitt?"

"About $125."

"It has already cost you $350 to provide bull service. You get $125 out of this investment so your net outlay for two years' pure-bred bull service is $225, $112.50 per year, or $18.75 for each cow. It looks now as if neighbor Dick had some other reason than that bulls became ugly for not keeping another one. Yes, Mr. Dewitt, the farmer with a small herd has quite a big handicap placed on him. It would be quite different if you had sixty cows. The cost would then be only one-tenth, or $1.87 for each cow."

"Yes, but I do not have sixty cows, and, what is more, have no possible chance of getting that many."

"From what you say there are some neighbors of yours that have cows, possibly as many as sixty cows could be found among your neighbors. If those neighbors would agree to use one bull, pay their share in the purchase, and later the keep, you would then be about on the same basis as if you had sixty cows of your own."

"That is what you call a co-operative bull association, is it? I have heard of that kind of an organization."

"No, Mr. Dewitt, that is not a co-operative bull association. It is only a part of one. It requires at least two other such blocks. You see, we call each of those parts of an association a 'block.' Before you get a co-operative bull association with its benefits, you must have three of these blocks and it is better if you have five or six blocks."

"I do not suppose we can form such an association in our county but I would like to know more about them. I have found that I cannot ask too many questions regarding farming, even if it does not seem at first to be of any use to me. In order for us to form an association we would have to get Bellew's Creek neighborhood to buy a bull and a neighborhood in some other place to buy another, and then we would have a co-operative bull association, is that the idea?"

"Yes, and no; in a general way you have the idea but there must be built an organization according to plans that have been used in the most successful associations. Unless you make it right in all respects you may get in the same fix as a man who has all four wheels on his wagon but no burrs to hold on the wheels; when he starts to drive, the wheels go each in different directions, according to the rut they get into, and then there is trouble. Unless the organization is built right the chances are that something will go wrong.

"Experience has shown that trouble arises if each block buys its own bull. To avoid this trouble the association is first organized, a director is selected from each block, and these directors together transact the business of the association. One of their first duties is to buy bulls for all the blocks of the association. You can readily see the reason for this when I tell you that the bulls are kept in a block two years and then each moved into the next block where they are again kept two years. This is repeated as many times as there are blocks in the association until all blocks have, at some time, used all of the bulls. It is, therefore, necessary that these bulls be of the same line of breeding and as nearly as possible equal in value."

"You said that the bulls are changed from one block to another every two years. Does that mean that I get the use of another bull after two years without additional cost?"

"Yes, that is exactly what it means."

"Then is it also right that if we have four bulls—four blocks—I will have the use of a good, pure-bred bull for eight years without paying any more than the first payment and the keep of the bull after that?"

"Yes, your part of the keep of the bull."

"Then the following figures are right. Sixty cows in a block and a $200 bull for that block means that $3.33 1/3 per cow has to be paid. I have six cows and $2.00 would be my share.

"Yes, if you have sixty cows in a block. If you have less than sixty cows, of course the amount per cow would be higher. The average number of cows per block in all the associations in the United States is forty-eight. You would have to add to this the cost of keep of the bull. How much do you think that would be, Mr. Dewitt?"

"Why not charge the same as we did in the first place, $75 per year?"

"That is fair, $1.25 per cow for the sixty cows in your block. The cost of keep of the bull per cow for eight years will then be $10. The first cost when buying the bulls is $3.33 per cow, or a total of $13.33 per cow for eight years. That makes the total cost per cow each year, $1.66. Compare that with $18.75, the cost for the same service when you buy a bull alone."

"I am interested. Again I see it pays to stop, look, and listen. But it seems too good to be true. Is there not something about this organization that is not so desirable?"

"This organization is like a new machine that is to do things for you that you have been doing with your bare hands. There will surely be some difficulties with the machine that you did not have before. There are now forty-four associations in the United States that are glad to have the troubles of an association that they may have its benefits. It pays to go to a little trouble for a $10 value when you can buy it for $1.00.

"Great as this advantage is, there is at least one other advantage that is greater, and that is the opportunity to try out and discover the exceptional bulls, and when they are found, to use them to the greatest advantage. To the individual this is nearly always lost. This is shown in the case of Aggie Cornucopia Count 13th that Mr. John Puls of Wisconsin used. When he found out what he was worth he went out to buy him back and found that the butcher had bought him for $50 when in reality he was worth $5,000. This is like selling $100 for $1.00. Similar instances are more numerous than you would imagine.

"There are other advantages too, as for instance, the greater number of animals of one breed in a community, which is always an attraction to buyers. You do not use as much money in providing bulls in an association as for yourself. This leaves you with more money with which to buy a pure-bred cow. If a pure-bred cow is bought at the time you organize an association it will not be many years before you have a pure-bred herd. With the association in your neighborhood you can depend on the use of a pure-bred bull all the time. It is possible for a man with one cow in the neighborhood of this association to raise a pure-bred calf each year, and what is more the man with one cow will find, at attractive prices, a ready sale in his own locality for the pure-bred heifer calves he raises."

(Continued on page 690)

The Nova Scotia Farmers' Association

The twenty-third Annual Convention of the ova Scotia Farmer's Association held their opening meeting Wednesday at 7.30 p. m., in the Court House, Truro, N. S., which was large ly attended, the President, Samuel Freeman of Amherst occupying the chair.

Meeting opened with prayer offered by Prof. Trueman, invoking the blessing of Divine Providence on all the deliberations of the Convention while in session.

This was followed by a splendidly prepared address by the President. It was moved and seconded that this address be accepted and published in full

Gentlemen:—

The honor you conferred upon me last year in electing me your President, makes it my pleasant duty to welcome you here tonight, at the opening session of the 23rd Annual Convention of our Nova Scotia Farmers Association, in this the progressive town of Truro, the educational and Railway centre of the Province.

Since my first conenctions with the Association when Col. Spurr was president, some of the best men of the Province have passed through the chair. So I ask you to kindly overlook wherein I do not measure up to the standard set by former Presidents, and to aid in the careful despatch of the business that shall come before you, that this may be a harmonious and profitable session.

The year of 1918 was the most eventful one since that year from which our years date. Nations have been in the melting pot. We should give thanks to a Gracious God for the plentiful harvest of our own land and his protecting care of our people and their allies. The arm that extended to the world the mailed fist instead of the helping hand he has palsied. The enemy beat out his own life on our elastic battle front, until the hour struck and our line with sinues stiffened to a front of resistless steel moved forward to its objective triumphantly.

At this point I wish to quote a tribute to the mother country from a report of one of our financial institutions, it says "Unprepared—except as to that navy which by blockading Germany really won the war—she raised a vast army which, like none of the other armies, fought in all the widely separated areas of the conflict. For two years which we awaited the entry of the United States, she bore the heavy part of the whole war, lending money, supplying munitions, coal, food, sympathy and advice to her allies. In resourcefulness, invention, daring and unyielding courage, whether in the trenches, at sea, or especially in the air, she astonished her own children and she amazed that part of the world which has never understood her, unless it be now that the war is won. When the war began she had a debt of three and a half billions of dollars. If we deduct what she has lent to her allies, and certain other recoverable items, she will probably owe twenty-one billions of dollars at a rough estimate."

It is no small thing that in the greatest war of the ages that Canadian Troops were the spear head of the British Army in many a hard fought fight, and in it all our Nova Scotia boys have done their part bravely and well. We glory in their achievements, and sympathize with those whose loved ones have left an aching void and instead of a glad home coming with their comrades, have won the wooden cross on Flanders field or on some other battle front.

The resourcefulness of our people has been shown in the fact that before August 1914, no Canadian manufacturer had ever made a shell or a cartridge case or a fuse, but in the second half of 1917 we were producing 55% of the shrapnel shell, 42% of the 4.5 shells, 27% of the 6 inch, 15% of the 8 inch and 16% of the 9.2 inch shells used in the British armies. During the war we built 90 steamships, manufactured 81,000,000. pounds of Powder, 75,000,000. pounds of High explosives and 700 tons of Carbide was shipped monthly.

The war is practically over. The Peace Conference has the greatest questions to grapple with that ever confronted a humane tribunal. The Farmers are left in common with others with big problems to take care of, if we are to measure up to what we should.

During the four and a half years of stress and strain the Farmers of Nova Scotia (applause) bore their part of the nation's burden faithfully in the front lines of the battle, in the reserve lines of home production and in contributing to the call for funds. Now we must turn to the duties of Reconstruction that come to us after the war problems. The last year had its perplexities. Help has been scarce, fertilizer high and may I say poor. The Province has been overrun by a disease that has left many homes desolate. While our boys about whom we have been anxious, have been in the danger zone winning glory for themselves and honor for their country.

The season of 1918 was an unusual one. The winter cold and snow deep, from Dec. 2 to the last of March. Spring cold and dry, until nearly the middle of June. Seeding was late. Rain continued until August. Hay was an exceptionally light crop. Very little was cut until the second week in August. Haying and early harvest weather was fine but cool.

October was moist and mild, frost occurred with disastrous effects June 21, August 23-24, and September 12th. The season was favorable for the growth of turnips, potatoes and hardy grains, but not for such plants as corn, beans and buckwheat. Amature bean growers were generally disappointed.

With the exception of Potatoes which are becoming more expensive to raise owing to the pests and numerous ills that beset them, the price of farm produce was high, but not correspondingly high compared with what a farmer has to buy.

Owing to the light hay crop much beef has been put on the market during the winter immature and unfinished, for which the producer received small prices, and the growing stock of the country was reduced.

The apple crop was light, the quality was good and has been selling for record prices, as you may judge from the smile on the faces of our friends from the Valley.

No Provincial Exhibition was held at Halifax. No Winter Fair or Horse Show at Amherst in 1918. Most of the County Exhibitions and smaller Fairs were held, with a creditable showing for the exhibitors and much valuable information was dispensed, and inspiration enthused as neighbors met in the show ring in friendly emulation. The Sydney Exhibition has assumed large proportions. The Yarmouth, Shubenacadie and Bridgewater Fairs have come to be looked upon as assured successes, as have many of the smaller shows. An increased interest is being taken in plowing matches, which are being conducted in different counties, and are a means of much cheerful and honest rivalry among competitors, in the most useful of arts. Field competitions have been carried on successfully in many counties.

The College of Agriculture, with its efficient staff, has been shedding its rays of agricultural knowledge over the Province. Owing to the war the attendance was much reduced. The work of the Womens Institute has been carried on under the capable supervision of Miss Fraser.

The daylight saving scheme is not in the Farmers interest, but to our protest we heard nothing but the echoes of our own voices.

More preparation than ever before has been made for home grown seeds for the coming season. Much less seed grain than usual will be imported and no turnip seed need be, as this Province has seemingly become aware of its possibilities in producing this seed. The Government farm at Kentville produced 30,000 lbs. and the Experimental farm at Nappan 8,000 lbs. These were the 1st. and 3rd largest producers of this seed in Canada. Considerable quantities of mangles, beet, carrot, and other seeds were also produced. Last month a car of seeds valued at $48,000. was shipped to Ottawa, from the Government farms in this Province. The largest crop of turnip seed was about 1200 lbs. per acre and 1400 lbs. of mangel seed per acre. There is little doubt that clean climatized home grown seed will produce better results than imported seeds. The Yarmouth Fruit and Produce Co., George M. Peck, Wolfville, and Crockett Bros., Antigonish are prepared to supply farmers in their localities.

We are now in the Re-adjustment period, Building back to peace, and are facing conditions entirely different from any we have ever had in the past. For four and a half years men have been drawn from peaceful occupations to the army and to work on war orders. Almost instantaniously on the signing of the Armistice half a million men and women were released, this brings us face to face with social and industrial problems such as we have never seen.

Since the signing of the Armistice, the decline of prices began, it is evident that the farmers' products are the first and most to be effected. The ferilizer men, the hardware men and others whose wares have in some cases been 300% above their former prices, have decided that no decline in the price shall be effected this season, while farm produce has declined in some cases 50% and will further lessen, while what we buy must remain practically unchanged for a time.

Our farmers are not organized for their own protection. We should work more along the line that the Western and Ontario farmers have been following. The farmers of Nova Scotia must not be of that number "Who work only that they must eat, and eat only that they must work."

"A wide unbounded prospect lies before us."

So with prudent and due consideration let us here assembled consider what is in our best interest and with unbending effort seek to have it carried into effect. We must show greater confidence in each other than we have here-to-fore, not perhaps have greater confidence in each others integrity, but show it in practical cooperation. We are so apt to buy what is offered us for sale by dealers or their agents. Let us get together and consider what is best suited for us and our local conditions in feeds, seeds, fertilizers, spraying materials, implements or whatever we need, and procure it without the retinue of more middlemen than is necessary. In 1914 the local government passed an Act known as the "Co-operative farmers Act of 1914," whereby 15 or more bona fide farmers may organize for their mutual benefit in trade. The Government made provision for the appointment of an inspector, who being duly qualified, was to organize, assist, advise, collect and disseminate information, calculated to be of value to such societies. The appointment of such an inspector has never been asked for. This I trust will be considered at this session.

Our politics should not be our master but our servant and be intelligently directed.

The agricultural future of Eastern Canada is unseparatedly linked up with the live stock industry. The price of hay and roots are dependen on the supply and demand of a limited area, but the trade in live stock and live stock products has a broad horizon. The war has stimulated this. Our total live stock export in 1914 was $53,349,118.99 for the fiscal year ending March 31, 1918 $172,743,081. Our meat products have a good reputation on the over seas market.

We now have the opportunity to hold and develop this trade in live stock and live stock products with the war depleted countries of Europe. For this there must be cold storage and shipping facilities at some Atlantic Port, that is open the year around. in order to enable us to compete successfully with countries well equipped but at a much greater distance from that market. This matter has received some attention. The Secretary of Agriculture and others from this Province recently visited Ottawa to present our claim, and will we trust give us a favorable report. You will be intensely interested in this matter as one which vitally effects our future welfare. I trust no due influence will be idle that can be used to have a cold storage plant and abattoirs erected at Halifax. There is such a scarcity of cattle throughout Europe and the work of building up herds will be so slow that we may expect a good market for years to come. If the Government do their part let us endeavor to do ours in the production of more and better live stock and live stock products. To this end I trust you will give no quarter to the scrub sire or the man who wants to keep a flock of dogs instead of sheep. It should stimulate the sheep industry to know that Nova Scotia wool sold for the highest price of any wool on the market, and if as it is estimated the world supply will not be normal for six years, the opportunity is evident.

We have not as many head of cattle per 100 acres as the United States, only half as many as Great Britain and France and only one quarter as many as Holland and Denmark. We raise 3 hogs per hundred acres of cultivated land, the United States raises 8, Holland 10 and Denmark 22. The United States have 3 times as many sheep per 100 acres of cultivated land as we Canadians have, Holland 6 times, Argentina 7 times, Great Britain 26 and Australia 29 times.

Much work of an interesting and profitable character has been carried on at the Government farms here at Truro and at Kentville and the Experimental farm at Nappan. I will mention only one item in connection with this farm. Since August 1915 a 92 acer wood lot has been cleared of over 300,000 feet of lumber, and has been in field crops for two years. On this land all their turnip seed was raised last year. This work was all done by prisoners of war. Time prevents further mention of this work of the Government farms, from the reports of which I trust you all receive help.

In closing let me call your attention to our returned soldiers.

We owe them a debt we can never pay. Also to those who will come to Canada, where large areas, and great opportunities await them, those whose attention has been invited to our shores by the exploits of our soldier boys, and sealed with their blood. These people will come to us for moral, social and legislative teaching. We must take up the white man's burden and exert a wholesome influence over them. Let us be worthy of God's trust, for they are coming hundreds of thousands strong. Shall we disappoint them? No. For we have learned that the destiny of a Country depends not on its natural resources,

but on the character of its people.

SAMUEL FREEMAN,
President.
Amherst.

Prof. Cumming, who needs no introduction to the readers of the Maritime Farmer, gave a most interesting sketch of the history of the Agricultural movement in Nova Scotia, in a carefully prepared paper on "The Agricola Centenary."

Just one hundred years ago this forward movement in Agriculture was started by a series of letters which were printed in the Recorder Office, Halifax, under the name of Agricola, but whose real identity was unknown. The first letter was published July 15, 1818, in which Agricola deplored the little or no circulation of sentiment among farmers, so much ignorance and inactivity, and suggested Agricultural Societies as one means of lessening this condition, where the climate of N. S. had in many instances been made the excuse, be proved that industry not a propitious climate was all that was needed.

These letters were published at the end of the Napoleonic War, about three years had passed, the Treaty of Paris and Peace had arrived, also the depression which was bound to come after the artificial prosperity that had been existing.

Prof. Cumming drew attention to similarity of the conditions 100 years ago and now. These letters attracted great public attention, and as a result 25 Agricultural Societies were formed within one year from date of first letter.

Agricola urged the people to cultivate the soil and although clay, sand, lime and magnesia were all he knew of and on some points be would vary largely from methods now employed, in the main he was sound. He laid particular stress on Lime, proving how Scotland dated the prosperity of her farms to the use of Lime on her potatoes in 1745. He also educated them through his letters in the value of manure as cultivation, advocated the rotation of crops and the importation of farm implements. This was the beginning of the Agricultural movement in Nova Scotia, and the first Prov. Agricultural Society met at Halifax, April 1819, appointing Agricola Secretary.

Agricola, when he declared himself, proved to be John Young, a merchant in Hailfax, although originally coming from Scotland. He died in 1837. Up to the time of his death 125 Agricultural Societies had been organized, which number has now increased to 275. He did much to interest the people along agricultural lines, declaring it the only staple industry. All other efforts yielded to time, but the land remained unchanged and would accrue the only permanent riches.

Mr. Sedgewick spoke of the interesting address Prof. Cumming had given, speaking of Prof. Cumming as an able follower of Agricola. He also suggested these letters which are in the main so valuable should be reprinted.

The next on the programme was the address of welcome given by Mayor Coffin of Truro, in which he extended on behalf of the Council the freedom of the town to the Association, and assured them of the appreciation in which he held the work being done by the College and Association along agricultural lines.

Mr. McLean of Port Hood replied briefly in a few well chosen words to the address of welcome, and told of the appreciation of the county from which he came of the benefits which accrue from the intelligent instruction procurable now by the farmer along his special line of work.

Lieut. J. G. Robertson then addressed the meeting on "Soldier's Land Settlement" question.

Prof. Cumming introduced Lieut. Robertson as a former Pictou County boy, a graduate from McDonald College and one who had conducted a large farm in Saskatchewan, previous to taking up arms in the defence of his country. A young man well qualified for the position he now holds, as Superintendent of the Soldiers' Settlement Board for the Maritime Provinces.

Lieut. Robertson spoke of the tremendous problem of repatriation and reconstruction now facing Canada, and touched briefly on the rights and claims of the returned men, they who had risked that which is most precious to us all, surely are worthy to be treated generously and fairly.

He told of the Government organizing this Soldiers Settlement Board with Principal Black an acknowledged agricultural leader throughout Canada at the head of this movement, and of these branches being established in the Maritime Provinces, namely in Halifax, St. John and Charlotttown.

He explained how it was the wish of the government to assist as many qualified men as wish to settle on the land, but clearly stated that they do not encourage the inefficient or an inexperienced man to attempt to farm and burden himself with the loans entailed.

On the other hand Canada is anxious to keep these men in their own Provinces, and discourages the soldier to go West and take up land where in most cases the difficulties are so great, therefore they have established these Boards and after a returned man has made his application, and it is determined by the Committee that he is qualified to farm, assistance will be given him to buy, to stock, or to improve his farm, lending money to the extent of $5,000 at 5%, with twenty-five years in which to pay for his farm, if he puts up 10% of the purchase price. Will lend money up to $2,000 for the purchase of stock or equipment which will bear no interest the first two years, with 6 years to pay off his indebtedness. Then for those wishing to spend money for permanent improvements, the government will loan up to $1000 at 5% for 5 years. In the first case the soldier gets his title to land, when payments are finished. Or, if he wishes title aften ten years, government will give it and take a mortgage. In the case of loan for equipment, etc., the government protects itself by a chattel mortstock as he sees fit, but must always sock as he sees fit, but must always keep the original value of quantity of stock until the same is paid for.

In the case of a soldier not passing the Qualification Board, which examines him as to his capacity for making a success of farming, there are two methods employed to help him to so fit themselves for the life of a farmer if he earnestly desires it.

1st. The Settlement Board will secure them positions with practical farmers, giving them a chance to learn the rudiments of farming for an entire season, receiving such remuneration as their services warrant from the farmer. Then his case will be reconsidered, after he has shown his determination to succeed.

Another proposal is that he may take a 12 week's course in an Agricultural College, studying practical farm work and after that, 12 weeks with a practical farmer, government paying transportation at the rate of 1 cent per mile, board and lodging and free instruction, while taking the course. Lieut. Robertson wished to emphasize that the Government does not give away free farms, but wishes to give every assistance to the returned man who earnestly wishes to take up agriculture as a business.

Lieut. Robertson asked the co-operation of the Association and suggested that one practical way of helping would be for some of the Nova Scotia farmers to express their willingness to take on these men and assist them to get the best farms possible when purchasing. The Great War Veterans had petitioned the Prov. Government to lend all assistance to soldiers to secure best farms possible, taking over any farms where clear title could not be secured and putting a valuation on it. Possibly the Association would think fit to do likewise.

A short discussion followed Lieut. Robertson's interesting address, after which with the appointing of Mr. Munn of Leitches Creek and Mr. Manning Ells as Credential Committee, the meeting adjourned.

Thursday, 9 a. m.

Meeting opened with President in chair.

Report of Directors by the Secretary, Mr. Bryan, received and adopted. Report as follows:

Report of Directors

To Members of the Nova Scotia Farmers Association

Gentlemen:—

Your Directors welcome you delegates from the various Agricultural Societies, County Farmers Associations to this the Twenty-third Annual Convention of this Association.

On account of the Influenza epidemic it was thought best to postpone this meeting from January to this month, we have now assembled and trust we will have a profitable time. We regret the absence of some prominent speakers on the programme. It was thought at one time that the Hon. T. A. Crerar, Minister of Agriculture would be able to visit us, but later, he found business too pressing at Ottawa. Also Mr. E. C. Drury, Vice-President of the United Farmers of Ontario had agreed to come, he had to give up the trip on account of voice trouble, having been speaking so much lately up there. However, we have been able to place a programme before you and we can very profitably spend time in full discussion on subjects that will be brought up.

We are glad to see that scarcity of labor, increased cost of living and continued increase in railway fares, and without the benefit of the Standard Certificate plan for free return tickets have not lessened the attendance and interst in the Association.

First of all we must voice our thankfulness that the War is over and that the Allies have completely defeated the enemy. Canada did her bit, not only in the trenches, but in production to support those at the front, and there is plenty more to do before, if ever, we get settled down to normal times again. What we can do or should do we will hear from time to time, let us not weary in well doing, but continue in the wood work. The Reconstruction Period will need the full support of us all.

We regret that Mr. E. C. Drury was unable to attend this meeting for there is no doubt that the farmers of Nova Scotia should be more strongly organized, he would have stirred us up; What have we, compared to Ontario and the Western Provinces. This Province needs an organization similar to the ones out West. An organization non political, but Agriculturalists, strong, united, agressive, so that when necessity arises we can secure those things advantageous to the Province. A body capable of advising the Government and when they do so advise, the Government will Act, having full confidence in the judgment and earnestness of such body.

We would strongly recommend that this Association approve of the policy of the United Farmers of other Provinces in Canada.

The Provincial Exhibition as anticipated was not held and the County Exhibitions which were held were slimly attended, accounted for by the Influenza and in one case the Health Authorities would not let the Exhibition be held at all.

The Prospects for the re-opening of the Winter Fair at Amherst are good, dates having been set and things are progressing satisfactorily.

Your Directors considered the Daylight Saving Scheme and sent a letter of protest to Ottawa, but without results, the clock is to be set forward one hour at the end of this month.

We regret the recent death of one of our Directors, Mr. E. J. Johnson, and we purpose sending on behalf of the Association, a letter of condolence to the family.

The programme will furnish topics for discussion and resolutions will be presented, these we commend to your earnest and thoughtful consideration.

The Financial Statement is as follows:—a copy of which you have in your hands, this has been duly audited and found correct by your auditors, Messrs. Landry and Trueman.

Signed on behalf of the Directors,
President.
Secretary.

Nova Scotia Farmers Association
Balance Sheet 1918

Cr.

Balance, January 1st	$222.91

CHAS. R. B. BRYAN,
Secretary-Treasurer

Audited and found correct.
J. P. LANDRY,
J. M. TRUEMAN,

Appointment of Resolution Committee as follows:

C. H. Black, Amherst; R. J. Messenger, Lawrencetown and Rev. Dr. McPherson, Antigonish.

Mr. Sedgewick of Musquodoboit suggested that the government should be written concerning some fitting memorial to be placed to the memory of John Young, this being the Agricola Centenary and a fitting time to commemorate the memory of he who was responsible for the development of Agriculture in Nova Scotia.

Mr. O'Brien, Mr. Cox and Mr. Sedgewick were appointed a committee to bring this matter to hand.

Report of Exhibition Commission was then read and approved.

Mr. Foster reported the securing of the Managhan property, which together with the Cross property, which they had already procured, would make a much more desirable entrance to the Exhibition grounds in Halifax. It was fully agreed that permanent buildings of concrete or such like should be erected instead of the wooden buildings of heretofore, and the erecting of buildings to accommodate Provincial rather than Dominions was favored. Mr. O'Brien of Windsor thought the Association should place themselves on record as strongly endorsing the intention to again hold exhibitions in Halifax, as soon as possible.

The following resolution was then put before the meeting.

At a meeting of the Nova Scotia Farmers Association on March 13th, 1919, it was agreed to request the Dominion Government to embody in the Federal Statutes the provisions of the Order-in-Council prohibiting the manufacture, the importation, and the transportation of liquor.

It was further agreed to ask that this legislation be introduced, at an early date, as a Government measure.

This was strongly opposed by one of the members as being no concern of the Farmers Association, but it was gratifying to note how strongly the Association endorsed the Resolution, realizing that what was so necessary to the prosperity and efficiency of the country in times of trouble must be equally so in times of peace.

Mr. Fuller then gave a very concise and interesting report of the Agricultural Societies of Nova Scotia. Number of Agricultural Societies qualifying for the Government Grant, 271. Seventeen new Societies organized, 18 dropped out, one resusticated, leaving the same number as previous

MARCH 18, 1919.

STABLE VENTILATION

It is a well-known fact that the good dairy cow is the hardest worked of all farm animals. All experiments, as well as practical experience, demonstrate this to be a fact. No other animai accomplishes so much by way of converting raw materials—such as grain and grasses—into the finished commodities—milk and butter-fat—for supplying food for mankind.

The dairy cow works day after day and year after year. If she is a desirable individual, she is very often kept in the dairy for 10 years or longer after she has reached her period of usefulness. To accomplish her purpose to the best advantage, she must be an animal of strong constitution. Other things being equal the cow with greatest indications of constitutional strength is considered most valuable, and, because she is well developed in this respect, a prospective buyer will pay more money for her. He realizes that to remain healthy, to work hard and persistently over a long period of time and to produce profitably, a cow must have large nostrils, she must be deep of chest and well sprung in the front ribs. If he analyzes why these essentials are necessary, he is brought to realize that one of the greatest factors conducive to health and productivity is oxygen.

One of the great functions of the cow is that of conveying digested nutrient from the digestive apparatus to the udder where they are made into milk and butter-fat. This process is accomplished by the blood which circulates between these two parts of the body, absorbing the nutrients at one point and depositing them at the other. To fulfill its mission, the blood must be frequently and thoroughly purified. Nothing except oxygen will do this. The only oxygen the cow finds available is in the air she breathes. The cow with small, closed nostrils, a shallow chest and a small heart girth is lacking in constitution because she does not have the capacity for utilizing large volumes of air containing oxygen to purify her blood readily. It is for this reason that cows of large breathing power and extensive heart and lung capacity are considered more valuable than those lacking in these respects.

When cows are on pasture, they do well, and one reason is that they are afforded by nature unlimited amounts of air and oxygen. Too often, however, men who realize the value of constitution when they select cows for purchase do not realize that regardless of how large the cow's nostril may be, how deep may be her chest, or how well sprung her front ribs, she is no more valuable than a cow showing less evidence of constitution unless she is afforded an abundant supply of fresh air. Because of this, on thousands of farms, cows are stabled in barns that are dark, cold, damp and poorly ventilated. Cows are compelled to breathe air which contains only a limited amount of oxygen. Because of this, it is absolutely impossible for them to do their best work. Even though they may milk largely when first stabled, under these conditions they gradually decrease in their milk flow, and finally become unprofitable, and in many instances fail to live long. Under such conditions, the germs of contagious abortion, cow pneumonia, calf cholera and many other diseases thrive to greatest advantage. No one would wilfully subject their cows to such conditions, and the reason they do so in many instances is because they have not given the subject their careful thought and consideration.

What many barns need more than anything else is an efficient ventilating system. Such a system permits the entrance of an abundance of fresh air loaded with oxygen, and removes the foul air in which there has been substituted carbonic acid gas—a poisonous product—in place of the oxygen which has been used up by the animals that inhabit the barn.

Many dairymen wonder why their cows do so poorly in winter time when they feed them so well, and care for them in the most excellent manner they know how, furnishing them in abundance with the choicest of feeds. They wonder why their herds are troubled with contagious diseases of every sort, why their veterinary bills are so high, and why their death losses so great. Lack of ventilation is the greatest reason.

It should be borne in mind that nothing will take the place of fresh air and oxygen. Regardless of how properly cows are fed, how thoroughly they are groomed, how well they may be exercised or how regularly they may be attended and milked, if the barn in which they are stabled is not properly ventilated, they will not do good work, and they will not remain healthy. Therefore they cannot be a source of profit.

Now is the time to look about the barn. If it is dark and damp, and disagreeable odors exist, improve the ventilating system, or put in a new one. Fresh air costs nothing. Why withhold it from the cow?

PURE-BRED BREEDERS' STATIONERY

Did you ever stop to think that every scrap of printed matter about your farm or used in your business is advertising? Do you realize that business cards, billheads, letterheads, checks, shipping cards, everything bearing the firm's name—and, by the way, everything should have the firm's name on it, is advertising?

And this should represent your business, not misrepresent it. One must never forget the fact that everything one says or does is advertising. Therefore, if you have a creditable herd of pure-bred hogs or cattle and poor farm equipment, a nice farm and poor stationery, you are building up in one place and tearing down in another.

One must remember the trite old saying that you can "often cut off your nose to spite your face." A little ceremony often means woeful waste. There is a vast quantity of very ordinary printed matter used by farmer-breeders. The big end of all that one receives in one's mail is very commonplace; and yet, if one but knew it, it would cost very little for all to acquire originality and distinction. It is a very funny thing, but it is a fact, that after many breeders get a customer, they will often send a poorly-written letter on ordinary stationery to that person just because he or she is a customer. The breeder becomes indifferent, at times, forgetting the fact that indiffeernce and lack of attention in little things often drives big customers away.

One should advertise just as much to one's customers as to the public in general. If you have made a man like your herd you want to make him like it better; you want to make a good impression deeper. You must take into consideration at all times the fact that there are others working for that man's business. No matter how the customer came to you, advertising brought him. You may say that the quality of your herd brought him to your originally and salesmanship landed the bird. That's all right; quality of goods of any kind is first-class advertising, and no newspaper advertising can be of value without being backed up by quality in what is offered. You perhaps will declare that your customer came to you because he was recommended by another customer, that's fine; that's another good kind of advertising. You may say that a customer read of your success at some stock show or fair and became curious to see your herd; that's advertising too, and advertising which very few understand and appreciate fully.

If you get a stack of a hundred letters in your mail and among them is a nice card, carefully printed, handsomely engraved, you are impressed with the fact that the sender has some regard for you. He demonstrates that he has taste and gives you credit for having taste. You surely look at that card more than once. You take it in your hand and bend it; put it nearer your eyes and scrutinize it; then your artistic taste admires the plain simplicity of the card or the handsome color combinations thereon. You make up your mind right on the spot that the sender is of some importance. It came from a wideawake, progressive business man.

There is no getting around the fact that we judge a man by the way he is dressed. At any rate, our first impression of a well-dressed man is a good one, and we will have a good impression of the gentleman unless he proves to be a "fake front." So it is with a business house. It is judged by the attractiveness of its show windows, cases and, among other things, its stationery and advertising matter. If you will look up your stationery bill for the year, Mr. Breeder, you will find it not large comparatively, and the cost between something which is distinctively striking and something exceedingly ordinary is very small—perhaps not five cents a day on all the stationery and printed matter you send out.

This article is of no consequence to some. They are the breeders who are in the spotlight of the industry to-day—who issue annually attractive catalogues showing their herd headers and attractive spots and nooks about their holdings, inviting visitors to their establishments. There are, however, hundreds of breeders who are neglecting this small but all-important phase of their business. It might be added that there is no branch of business-doing that calls for, and provides more attractive stationery than does the livestock business. There is no reason, then, why breeders' business cards, letterheads, envelopes and such should not reflect to some extent the high charaiter of his establishment and the skill of his calling.

Let us have the opportunity of printing some nice effective stationery for you. It's an investment of which you will always be proud.

New Brunswick Dairymen United

Strong Organization Formed at meeting held in Sussex on March 7th Officers elected and important Resolutions passed.

An important meeting of N. B. Dairymen was held in the Agricultural Hall, Sussex, on Friday, March 7th.

Delegates representing all branches of the Dairy Industry were present and important qeustions to the trade were discussed and action taken thereon.

E. P. Bradt, Secty. of Agriculture for N. B., H. W. Coleman, Dairy Supt., George H. Barr, Chief of the Dominion Dairy Division and Harvey Mitchell, of the Dominion Dairy Division, were present and took part in the proceedings.

The morning session was taken up with the exhibit of cheese, representing the August and September makes from 20 factories. These were scored by Mr. Barr, the result of whoes finding will be seen in the prize lists following.

After the cheese had been scored by Mr. Barr and results announced, a general discussion led by Mr. Barr was taken up and many points of interest were brought out and thoroughly gone into.

The following was result of Mr. Barr's scoring and the prize winners.

Prize Winners Cheese Exhibit, Sussex March 7, 1919. Value of Prizes, $170.00

August Cheese

$25.00 from Provincial Department of Agriculture to be divided pro rata among cheese makers, whose cheese score 90 points min., Flavour, 39 points.

The result in the competition was as follows, the first five being prize winners.

August

1—Harry Parlee, Newtown, 93.1.
2—Albert Sear, Penobsquis, 92.6.
3—Fred Fawcett, Hammond, 90.9.
4—H. H. Gillis, Hd. Millstream, 90.2.
5—Nelson McKenzie, Mannhurst, 90, Flavour.
6—W. W. Preble, Lr. Ridge, 90.
7—Chas. Yoemans, Petitcodiac, 89.9.
8—Jas. Haslam, Carsonville, 89.8.
9—Ben. Keith, Havelock, 89.5.
10—J. A. Northrup, 89.4.
10—J. A. Northrup, Berwick, 89.4.
11—O. W. Keirstead, Collina, 89.2.
12—S. Gibbons, Corn Hill Corner, 88
13—Joseph Ready, Clover Hill, 88.7.
14—Waldo Rogers, Lewis Mt., 88.5.
15—E. B. Keith, Canaan Road, 88.0.
16—Wm. Taylor, Pearsonville, 87.3.
17—Jas. H. Brown, Corn Hill, 87.2.
18—J. A. McGilvery, Bellisle Creek, 86.9.
19—B. Fawcett, Killam's Mills, 86.
20—D. Collings, Mt. Middleton, 85.3.

September Cheese

$25.00 from Provincial Department of Agriculture to be divided pro rata among cheese makers, whose cheese score 90 points min., flavour 39 points.

Result as follows, first eleven being prize winners:

September

1—O. W. Keirstead, Collina, 94.2.
2—A. Sear, Penobsquis, 94.1.
3—Joseph Ready, Clover Hill, 93.4.
4—S. Gibbons, Corn Hill Corner, 93.1
5—Harry Parlee, Newtown, 93.0.
6—J. H. Brown, Cornhill Cheese & B. Co., 92.7.
7—Robert Prebble, Lr. Ridge, 92.3.
8—J. A. Northrup, Berwick, 91.5.
9—Wm. Taylor, Pearsonville, 91.3.
10—Fred Fawcett, Hammond, 91.1.
11—Bliss Fawcett, Killam's Mills, 90
12—H. H. Gillis, Millstream, 89.9.
13—James Haslam, Carsonville, 89.9
14—D. Collings, Mt. Middleton, 89.6.
15—Ben. Keith, Havelock, 88.9.
16—Waldo Rogers, Lewis Mt., 88.5.
17—Nelson McKenzie, Mannhurst, 87.9.
18—J. A. McGilvary, Belleisle, 86.7.
19—Chas. Yoemans, Petitcodiac, 86.4
20—E. B. Keith, Canaan Road, 86.

The following were special prizes the winners of which were:

$10.00, G. E. Barbour Co., $1.00 each to the 5 highest scoring in August and September cheese, money to go to the makers.

August Cheese

Harrp Parlee, score 93.1.....$1.00
Albert Sear, score 92.6 (makers) 1.00
Fred Fawcett, score 90.9..... 1.00
H. H. Gillis, score 90.2..... 1.00
Nelson McKenzie, score 90. (flavour 1.00

September Cheese

D. W. Keirstead score 94.2..... 1.00
Albert Sear, score 94.1..... 1.00
James Ready, score 93.4..... 1.00
S. Gibbons, score 93.1..... 1.00
Harry Parlee, score 93..... 1.00

$10.00, J. D. McKenna, $5.00 to each of the makers exhibiting the highest scoring August and September cheese. Harry Parlee, August, score 93.1, $5.00
D. W. Keirstead, Sept., score 94.2 5.00

$15.00 from the Harris Abbatoir Co., St. John, N. B., to be divided pro rata among the factories whose August cheese score over 90 points and flavour 39 points. Money to go to patrons.

	Score	Flavour
Newtown	93.1	40.5
Penobsquis	92.6	40.5
Hammond and Markhamville	90.9	39.0
Head of Millstream	90.2	39.0
Mannhurst	90.	40.0
Lower Ridge	90.	39.0

$15.00, Gunns Ltd, St. John. To be divided pro rata among the factories whose September cheese score 90 points min. Flavour, 39 points. Money to go to patrons.

	Score	Flavour
Collina	94.2	40.7
Penobsquis	94.1	40.6
Clover Hill	93.4	40.2
Cornhill Corner	93.1	40.7
Newtown	93.0	40.7
Cornhill	92.7	40.2
Lower Ridge	92.3	40.0
Berwick	91.5	39.9
Pearsonville	91.3	40.3
Hammond	91.1	39.0
Killam's Mills	90.0	39.2

$25.00 (value) DeLaval Co., Montreal, $12.50 to the maker having the highest scoring August cheese on exhibit. Value allowed on any factory equipment purchased by the winner during season 1919.

$12.50, same conditions for September cheese.

Harry Parlee, August, score93.1.

D. W. Keirstead, Sept., score 94.2.

$15.00 from Smith & Proctor, Halifax, N. S. To be divided evenly among all factories whose cheese score 40 points or over for flavour. Money to go to patrons.

1—Newtown 40.5
2—Penobsquis 40.5
3—Berwick 40.0
4—Mannhurst 40.0

$15.00 from R. B. Colwell, Halifax, N. S. To be divided among all factories whose September cheese score 40 points or over for flavour. Money to go to patrons.

Collina 40.7
Cornhill Corner 40.7
Newtown 40.7
Penobsquis 40.6
Pearsonville 40.3
Clover Hill.....40.2
Corn Hill.....40.2
Lower Ridge.....40.0

Wyandott Special, sweepstake prize camera, value $15.00, by J. B. Ford Co. Won by O. W. Keirstead, Collina, September score.....94.2

In the afternoon a meeting of the delegates was held in the Assembly Hall. Mr. Sterling Keith of Butternut Ridge acted as chairman, with F. G. Hughson, Cornhill, K. C., Secretary.

Mr. Harry Mitchell presented the prizes to the prize winners in the scoring contest and Mr. Coleman read over the prize lists explaining same. Prizes to the value of $170.00 were awarded.

On motion of T. G. Perry, seconded by N. W. Eveeligh and carried, it was resolved to proceed with the organization of the Dairy interests of the Province.

Dairy Supt. Coleman outlined the proper method of organization and submitted many useful facts along these lines to the meeting.

On motion and carried the Chairman, who was asked to appoint a committee to draft a constitution, named the following, the first to be chairman: Messrs. Huggard, Trites, Hughson, Keirstead, Northrup, Bleakney, Conrad, Coleman.

During the deliberations of this committee, Mr. Simmons of Moncton told of meeting at Ottawa with the representatives from the other provinces of the Dominion for organization of National Dairy Council.

George H. Barr, chief of the Dairy Division, Ottawa, spoke on the need of dairy organization in New Brunswick.

The commttee appointed to draw up draft of Provisional constitution, reported, and the draft was read and explained by Mr. Coleman. The report of the committee was accepted, and it was decided that the name of the new organization would be "New Brunswick Dairymen United."

The Board of representatives called for was elected as follows:

Cheese Factory Patrons—Thos. G. Perry, Butternut Ridge; F. G. Hughson, Cornhill.

Creamery Patrons—S. L. Stockton, Petitcodiac; J. T. Barnes, Sussex.

Private owned factories—Nelson Eveleigh, Sussex.

Stock Cheese Factories—E. M. Vail, Belleisle.

Independant Cheese Factories—O. W. Keirstead, Collina.

Privately Owned Creameries—Ed. Robinson, St. John.

Stock Creameries—A. E. Trites, Salisbury.

Independant Butter Makers—J. A. Conrad, Sussex.

Independant Cream and Milk Shippers—W. H. Huggard, Norton.

E. P. Bradt, Secty. of Agriculture, in an instructive address emphasized the need of such an organization as that just formed, and pointed out the possible savings in the purchase of supplies and also the need of making quality goods and increasug production. He offered to encourage production by providing funds for herd competitions, providing each factory would put up a similar amount of money, $15.00.

The following resolution was moved by J. P. Simmonds and seconded by J. A. Conrad, and carried.

Whereas the Federal Authorities saw fit to temporary admit the manufacture and sale in the Dominion of Canada of Oleomargarine, and

Whereas the order permitting said manufacture and sale was granted only to relieve food conditions during the war, and

Whereas on the successful conclusion of the war conditions in the Dominion will again become normal,

Therefore be it resolved, that the New Brunswick Dairymen United are anxious to see that the permit for sale and manufacture of Oleomargarine is rescinded at as early a date as possible.

Moved by W. H. Huggard and seconded by J. Titus Barnes, that

Wheeras the use of inferior bulls by the farmers of New Brunswick is in a large measure responsible for lack of increased production by the dairy cows, of the Province is recognized by everyone. Being sure that a more general practice of cow testing would mean the elimination of many of these inferior animals.

Be it therefore resolved that the N. B. D. U. request the Provincial Department of Agriculture through the Superintendent of Agriculture Societies, the Dairy Instructors, District Representatives and other officers of the Department to make greater efforts to increase the practice of cow-testing. (Carried).

The following resolution was moved by Jas. Stultz, seconded by H. F. Hughes, and carried.

Whereas the world war is about to be terminated successfully to the Dominion of Canada, and whereas that from now on will come a period of readjusting of the Agricultural industries in Canada, and whereas it is generally agreed by Agricultural experts that large portions of New Brunswick are well adapted to dairying, and whereas, to bring about the necessary changes to make the citizens of New Brunswick realize the opportunities that lie before them in Dairy work, a very progressive and effective means of education will have to be effected, and whereas a beginning has been made along this line through the medium of the Maritime Dairy School, carried on in connection with the College of Agriculture at Truro, N. S., supported financially and otherwise by the three Maritime Provinces, and whereas the present buildings, plant and equipment are not large enough for the development of the school, be it resolved that the New Brunswick Dairymen United in convention assembled, place such appreciation on record for the good work that has been done in the past, in getting the dairy interests of the Maritime Provinces centered together in the Martime Dairy School. That it is convinced that better and more efficient work can be done through the medium of one school of sufficient size and capacity than more. That a school of this class should be purely Maritime, that is owned and operated co-operatively by the three Maritime Provinces. That just as soon as possible a school of sufficient size and with proper equipment to best accomplish these purposes be established. That a committee of three be appointed from the New Brunswick Dairymen United to present the resolutions to other interested associations and also to the proper Government officials in the different Provinces.

James Stultz, H. F. Hughes and W. H. Coleman were appointed a committee to deal with resolution re Dairy School.

At a meeting of Directors, the following officers were elected:

F. G. Hughson, Cornhill, K. C., Pres.
A. E. Trites, Salisbury, Vice-Pres.
T. G. Perry, Butternut Ridge, Auditor.
H. W. Coleman, Secretary.

The Secretary was instructed to prepare a set of by-laws, rules and regulations for submission to board at as early a date as possible.

Pedigreed seed bears the same relation to the grain growing industry as pedigreed stock bears to the live stock industry, and its use is necessary if a grower desires to maintain the yield, purity and durability of his grain.

The N. B. Farmer's and Dairymen's Convention

Forty three years old and still going strong is the the record of the New Brunswick Farmers' and Dairymen's Association. Milestone forty-three was reached at the convention held in the city of Fredericton on the 11th to 14th inst., when delegates representing the majority of the Agricultural Societies of the province assembled to discuss the problems of their profession. L. M. Anderson, president of the Association occupied the chair, being occasionally relayed by vice-president J. A. Bernier.

PRESIDENT'S ADDRESS

Brother Farmers and Citizens of Fredericton:

I deem it a high honor to have the privilege of opening the forty-third annual Convetnion of the Farmer's and Dairymen's Association of New Brunswick.

Since we last met, the horrors of the greatest war which the world has even known have ceased, and we hope, for all time to come. When we stop to consider what the future holds out to us we can see the many great questions and problems which must be worked out before we can settle down to pre-war conditions. One great incident which has been very noticeable to me is that the war has been the means of proving, beyond a doubt, that **Might is not Right,** and that even the smallest nation or most humble citizen has a place, and is needed in the World, and I sincerely hope people in all walks of life have been made to realize that all must live and let live. The common people are demanding a fair deal from the powers that be, and are going to persevere in their demands until they succeed. YOU that have studied this great question from a broad-minded standpoint will agree with me that on the whole the common people have been unfairly dealt with in the past.

There are to classes of people whom we knew very little about, in fact they barely existed in Canada before the war, and (so to speak) grew over night—not only into hundreds but into hundreds of thousands. I refer to our great Naval and Military organizations. If given justice, as they should be, they must rank above all, in our provision and care. I sincerely hope that our Governments to whom we look will give these brave, noble men and their dependents their just dues, and that the schemes evolved by these governments, especially in the land settlement for soldiers, will be practical and framed with a view to protect these defenders of our country, and not result, as heretofore, in the case of Immigrants, in the palming off of old worn-out farms on innocent settlers, unfamiliar with local conditions and perhaps unskilled, to the advantage of political heelers. It seems to me further that the Government, in the application of its bounties and favors to returned men, should strongly discriminate in favor of the dependents of those who have made the supreme sacrifice, and likewise to the benefit of those who have suffered through long and dreary months in the trenches of France and Flanders.

Labor in our towns and cities has been forced to organize in order to get a living wage, as a result of which the common man of the city is being respected as he never was before, by the Capitalists, because the latter realize that without competent labor, industry and manufacturing cannot prosper. As the great wheel of life revolves the classes are beginning to realize that the more prosperous the masses, the more demand there must be for all kinds of agricultural and manufactured goods.

There are phases of agricultural activities which practical farmers and scientific men who have been brought up here and have traveled over other parts of the North American Continent, will agree, would not prove profitable here. For instance: In Ontario, Quebec and Western Canada, breeders of pedigreed live stock can get prices that generally pay them well—from One Thousand to Ten Thousand Dollars for sires and dams. Here in the Lower Provinces it only happens on very rare occasions that a breeder of high-class stock gets a remunerative price. If he could get these paying prices, why is he not at it today? I only know of one or two breeders of high-priced pedigreed stock who were in the business fifteen years ago, that are now carrying it on. I will leave it to you as to their reasons for discontinuing. Certain of our Governmetn men have in the past and are today advising us to specialize and go into only one line or branch of agriculture. The Maritime Provinces always have been mixed farming districts and never will be anything else. Specializing will not pay because of the very limited markets. (My father used to tell me, "A little bit of everything, and not too much of anything" was a good motto which worked well with him, and I believe he was in the right.)

The proposed cold storage, abattoir and stock-yard plant, which the Dominion Government has promised us, will help our ambitious farmers out wonderfully, once it is open for business.

The Money. which our Governments are spending on agriculture is doing good in many cases; but I am satisfied that if those in authority would listen to our practical farmers a little more and abide by their advice the money would give the average farmer, for his labor, a return of Two Dollars where he is getting One under the present system of Government aid.

It is today being charged in financial circles and through the press that farming is the most profitable profession in Canada, and that the farmer is rapidly becoming rich and clamoring for larger profits. If agriculture is on such a sound basis, why is it that our young people are leaving the farms every day to make a living at occupations other than farming? As a matter of fact it is undisputed by practical farmers and business men who have tried the farming for the big profit game that agriculture is at the lowest ebb it has been for many years in the Province, and any prosperity which our farmers may have is not due to excessive profits, but to the habits of strict economy in every detail in which they have of necessity been trained.

Gentlemen, unless we forget our old political sores and organize into a solid body, FARMERS, first, last and all the time, the legislators of this country will never put any practical ways and means before us which will encourage our young people to stay on the farm, and if conditions are allowed to exist as they are, farming is bound to grow less remunerative and, therefore, less attractive.

I would like to specially draw the attention of the young farmers at this meeting, and throughout the Province, to he activities of the United Farmers Association of Western Canada, Ontario, Quebec and New Brunswick, from a social, economical and political standpoint. In Ontario particularly, where the old party lines were even

tighter drawn than in our own Province, the recent be-elections clearly show the mighty influence of Farmers, organization and point to at least a fair agricultural representation in the next Assembly. Let us emulate these Provinces in our organization, for the benefit of our most noble profession.

L. M. ANDERSON, President
The Farmer's and Dairymen's Association

Fredericton, N. B., March 11, 1919.

In the absence of His Worship Mapor Hanson, Mr. Joseph Walker, Deputy Mayor, fittingly extended the cordial welcome of the citizens of Fredericton to the members of the Farmers Parliament. As a business man who is in close touch with the woolen industry and its products he strongly advised the farmers of the province to do their utmost to capture their share of the wool trade by increasing their flocks and taking advantage of the high prices that are sure to prevail for some time to come owing to the present depleted condition of the world's wool markets.

Vice-president Bernier made a fitting reply in the course of which he assured Mr. Walker that if the city fathers of Fredericton have occasion to visit the country they will be accorded a rēciprccal welcome and the hospitality that characterizes the agriculturists of the province. He referred in glowing terms to the progressive steps for the advancement of the agricultural professions that are being taken by Hon. J. F. Tweeddale Minister of Agriculture, and his staff. Mr. Bernier concluded his remarks by adressing the Acadian members for a few minutes in their mother tongue.

Hon. J. F. Tweeddale, minister of Agriculture on rising to address the meeting was heartily applauded. He stated that he was a farmer from boyhood, having carved a home for himself out of the virgin forests of Victoria County where the soil is good and rich and had made a success of the undertaking. He had learned a great deal by dint of hard work and practical experience—the kind of knowledge that is realy worth while theoretical knowledge has its place but in order to be of value it must put into successful operation. The scientific and the practical going forward hand in hand comprise a team that even abject adversity can hardly lefeat. He assured the Convention that he was ready at any time to champion the right of the industry he had the honor to represent in the Legislative Assembly of the Province. The minister made fitting reference to the great sacrifice that had been made during the recent war by the young men of Canada not only in the trenches but also in the Empire's second line of defence, on the farms where the food products essential for the successful prosecution of the struggle to a victorious conclusion were produced. The women of New Brunswick in common with their sisters in all parts of Canada had played a glorious part that will never be forgotten; but their praises will be sounded from generation to generation.

The farmers of New Brunswick had made a grand response to the call for increased wheat production within the bounds of the province. As head of the department of agriculture he was proud to announce that statistics recently gleaned show that New Burnswick farmers have actually produced sufficient wheat during the season 1918 to bread the people of the province for the ensuing year. The wheat mills are crowded with work and he has found it necessary as a further inducement to millers who must increase their milling facilities to cope with this work to grant an increase in the bonuses on roller process mills. Mr. Tweeddale outlined the Soldier's Settlement Bill and the assistance that returned soldiers who are inclined to settle on farms may expect from the local and federal governments. The various lines of work conducted under the auspices of his department by the members of his staff in their respective divisions co-operating with the farmers of the province were explained and an invitation extended to farmers to make the utmost use of the members of the staff in any capacity within their domain. In conclusion Mr. Tweeddale introduced Mr. .E P. Bradt, the new Deputy Minister. He also paid a tribute of appreciation to the work that is being done by Mr. Harvey Mitchell, of the Federal Dairy Division in asisting by timely advice and untiring efforts in the promoting of the dairy interests of the province. New Brunswick dairymen are now facing the question of producing quality goods fairly and squarely and the results already achieved are most gratifying.

Mr. Brad expressed his appreciation of the cordial reception he had been accorded by the farmers of New Brunswick whenever he had had an opportunity to meet them. He felt that he was no longer a stranger and solicited the co-operation of all concerned to not only keep the New Brunswick agriculture to the fore but advance it in all its lines where improvements may be made. A co-operation of this kind will spell success for any movement.

The following committees were named by the President:

Resolutions.—Isaac W. Baird, A. J. Gaudet, M. A. MacLeod, A. Chase Fawcett and Geo. E. Fisher.

Finance.—H. D. rMerseeau, Edward Scovil and D. Z. Daigle.

Nominating.—A. C. Fawcett, Westmorland Co.; F. H. Walsh, Albert Co.; L. B. Somers, Restigouche; F. C. Peoples, Victoria; Scott A. Shaw, Carleton; Donald Watting, Northumberland;, D. Z. Daigle, Madawaska; J. E. Degrace, Gloucester; A. J. Doucett, Kent; J. W. Baird, Queens; Fred Wood, Kings; H. D. Mersereau, Sunbury; Rev. M. Cochrana, Charlotte; J. M. Donovan, St. John.

Parliamentary.—Jas. Brennana, E. P. Bradt.

The opening number scheduled for Wednesday morning's programme was an address on "How Can We Best Increase Crop Production in New Brunswick," by W. B. Fawcett, Sackville. Owing to recent illness Mr. Fawcett was unable to be present but he had delegated his brother, Mr. A. C. Fawcett, to take his place. Mr. Fawcett read a carefully prepared paper in which he pointed out several pertinent facts that are at present deterring the progress of the agriculturist. Mr. Fawcett's paper will be published in full in these columns. A lively discussion ensued, in the course of which a number of speakers concurred with some of Mr. Fawcett's ideas, but who unfortunately did not offer any constructive ideas as to how some of the causes of complaint may best be eliminated. Mr. D. B. McKinnon, of Westmorland county, made the trite remark that when a doctor is called to see a patient his first act is to try to ascertain the root of the trouble before making suggestions re a remedy. If the farmers of Canada wish to remedy any of their causes for complaint they will do well to look to themselves and their strict and almost religious adherence to party politics as the source of their troubles. The housecleaning must begin by first eradicating narrow party politic ideas and stand solidly and independently for only the best principles that will tend to alleviate grievances and spell progress.

Mr. C. F. Alward said farmers must learn to do something they have in many cases neglected to do in the past viz., give their boys a chance to qualify themselves to take their place on the public platforms and discuss the great issues of the day on a par with the devotees of the so-called learned professions. Farmers and their sons are too retcient and this is really one of the reasons why more farmers do not gace our legislative halls.

HORTICULTURE.

WHY SPRAYING WILL PAY IN 1919

For four years the apple growers of the Annapolis Valley have in response to patriotic calls, grown all of the field crops such as beans, oats and potatoes that they could, but in some way have found time to prevent their big permanent asset, their apple orchards from deteriorating. It is true that they have not sprayed, pruned nor cultivated quite as well as usual, but the neglect has not been enough to influence the trees appreciably from one year to another. They knew that when the war broke out they were slowly winning over their competitors for supremacy in their natural market, the English Market. They knew that neglect was common in competing sections, and that if they cared for their orchards, the end of the war would see Nova Scotia stronger in the English apple market than ever before. Two things they did not consider, and did not expect, have come to their aid and placed them to-day in a stronger position than even the most sanguine dreamed. One is the increase in rail freight rates, which makes the cost of transporting of apples from Western America to England almost prohibitive, while Nova Scotia with apples practically at the dock is not seriously affected by increases in rail freights. The other is the low temperature of the Winter of 1917-18, which killed an appreciable percentage of the trees in North Eastern America in sections that are in a position to compete with Nova Scotia.

Events of the past few months have justified those who have advised Nova Scotians to care for their orchards during the past four years. Practically everything that has gone across has brought the maximum price, clearing in Nova Scotia, from seven to ten dollars per barrel, and the markets and steamers transporting the apples have called for more and more apples until the warehouses are bare.

All who understand the situation now agree that the prospects are for high apple prices for a long period. Nova Scotians having kept their orchards in condition for just this opportunity, are not being injured by the frost of the Winter of 1917-18, nor innfluenced appreciably by the increase in rail freights, must benefit more than the growers of any other section by the conditions that have come about.

In order to hold this market for their own, it is now up to Nova Scotia to produce the largest crops of high grade fruit as cheaply as possible. A large volumn of apples moving will attract the fastest and largest steamers, and not only lower charges all along the line from producer to consumer, but will tend toward getting the fruit on the market in better condition. This will tend to prevent such destructive competition from developing, as developed during the .90's; but in order to insure the market for ourselves we must grow good fruit and grow it cheaply.

We know that thorough spraying means the difference, in most years, between 10 to 30% of o. 1's, and 60 to 80% of No. 1's. Thorough spraying too means in average years the difference between 20 to 50 barrels per acre and 80 to 120 barrels per acre. In 1913 thorough spraying meant the difference between a good crop and no crop, in practically every orchard in Nova Scotia.

It costs from $15 to $25.00 to spray one acre of orchard four times, labour, material and depreciation on sprayer included. Either the increase in quality or the increase in quantity will usually pay the spray bill twice over when No. 1 apples are $2.50 per barrel. How many times they will pay the spray bill in 1919 remains to be seen. Nova Scotians both individually and collectively need a large crop of clean fruit more in 1919 than in any year since Nova Scotia first shipped apples to England. I do not mean by this that they need the high prices that all are quite confident will rule more than anyone else, although the apple men of Nova Scotia are the exception among farmers generally ni being rendered poorer by the war, but more in order to get the first innings on the market, get a firm hold and get the trade channels developed right and large before unnatural competitors again appear.

For the reasons enumerated it would seem good business for Nova Scotia apple growers to spray more and better in 1919 than ever before.—By G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S.

CROP ROTATIONS FOR EASTERN CANADA

(Experimental Farms Note.)

Profitable yields of field crops in the future can be assured only by the adoption and persistent practice of suitable crop methods. There are many factors, which combined, tend to influence crop yields and the cost of production but the prime factor in stimulating immediate increased crop returns and in establishing for the future a stability in crop yields is the practice of crop rotation under mixed farming conditions. This term denotes a combination of different classes of crops which are grown in such order that the preceding one prepares the land for or otherwise aids the crop following.

The essentials of a good rotation include roots or corn, grain and hay grown in the order named. The duration or cycle of the rotation may be varied to suit particular conditions. Moreover, it may be advisable where conditions warrant to combine two or more rotations on the one farm There are innumerable combinations of different classes of crops which will prove satisfactory when applied judiciously. Under any circumstance it is absolutely necessary, in order to obtain even medium crops, to apply at least the principles already indicated as essential in all good crop rotations. The working of these principles may be explained by the accompanying practical illustration. Such crops as corn, roots and potatoes require abundant suplies of food from the soil for stem, leaf and root growth. This may be most profitably and practically furnished by clover or other sod ploughed down or by applications of barnyard manure. The cereals such as wheat oats and barley require less of the readily available food and generally do best following hoed crops for which manure was applied or after a leguminous crop such as peas or clover. Sod, too, well prepared produces satisfactory yields of cereals. The area sown to cereals, seeded to clovers and grasses will supply excellent hay-crops the following year or two years. The sod of the latter turned down and manured fits the land for corn or roots once more.

Such general plan of procedure or crop rotation may be modified by each farmer as will best suit his soil and needs. Several combinations of mixed farming crop rotations are in operation throughout the Experimental Farm system in Eastern Canada an outline of which is contained in the circular number 9. Copies of this circular are available free on application to the Filed Husbandry Division.

The progress made in the work carried on to date has led to the conclusion that the following characteristics are desirable under almost any conditions in mixed farming rotations:

Grain fields should be seeded down with clover, even though it be used only as a fertilizer.

Grass and clover seedings should be heavy. Increased crops of hay and rare failure of a catch have justified this practice.

Hoed crops should form a large proportion of every rotation. An attempt to farm a small area without a hoed crop was not successful. Weeds could not readily be kept in check.

No field should be left in hay for more than two years. The records show that the second crop almost always costs more than the first per ton, and that succeeding crops are very liable to be grown at a loss.

Barnyard manure should be applied frequently in comparatively small quantities rather than at long intervals in large quantities.

In this progressive age the man who will not give his orchard the proper care it is entitled to should chop it down and use the ground for some profitable crop. There was a time when fine apples could be raised without care, but that time has passed and there is nothing to be gained in keeping old trees without the usual routine in orchard work.

SPRAYING PROBLEMS

SPRAYING A NECESSITY.—It is no longer necessary to persuade people to spray their trees. The need of it is apparent to almost everyone, but how to get it done is a problem to some of us. The large commercial orchardist is better able to work out his spraying problems than the small grower or farmer with an acre or less of orchard. Yet these trees must be sprayed if really good fruit is desired. Because of increased difficulties and expense the man with a few trees too often neglects to spray.

COMMERCIAL SPRAYING.—In some neighborhoods the commercial sprayer is doing good work. For a number of years the writer conducted such a business and his former partner is still carrying on the work with success. We frequently applied 10,000 gallons of spray in a season, treating perhaps a hundred or more farm apple orchards during the operation, which lasted about a month altogether. We made two applications, one with lime-sulphur in early Spring while trees were still dormant, and then a "fruit spray," starting in just after petals had fallen, and extending for about one week. We first used a gasoline power outfit, but later used the barrel pump as better suited to the varied line of orchards which we encountered in our rounds. I have heard of communities where commercial spraying had not been a success owing to the ignorance or dishonesty of the sprayers, or because of the farmers not appreciating the benefits of such a plan. Where such a plan is not workable the farmer or fruit grower must endeavor to do his own spraying somehow. The following notes on various spraying problems may be helpful.

SELECTING OUTFIT.—If it is necessary to purchase a new outfit care should be taken to select one that fits the needs of the purchaser. A heavy outfit seldom gives satisfaction, as the spraying may need to be done when ground is soft from Spring thaws or heavy rains. A heavy power outfit on a soft hillside is about as provoking as a three-ton truck in a mudhole. In selecting an outfit the hilly or level conditions of orchards to be sprayed are of more importance than the size of the orchard. The power outfit will of course save labor of pumping. Where labor is scarce this is quite an item.

DETAILS OF HANDLING.—If orchard is comparatively level the power outfit may be equipped for using two leads of hose. Otherwise I would arrange for only one lead of hose. Thus correspondingly lighter engine and pump and smaller tank may be used. Each lead should consist of at least 20 feet of good hose, shut-off, 10-foot rod with "Y" attached to end of rod and two good nozzles. There should be an eighth turn between angle of rod and front face of nozzle. . This can be secured either with eighth turn "Y" or straight "Y" and eighth turn elbows between "Y" and nozzles, or with eighth turn nozzles connected directly to "Y". Either combination will have the desired effect. Use a strong, light wagon, preferably with wide tires and built so that front wheels will turn completely under body.

HAND POWER.—A splendid hand power outfit is the barrel pump mounted on a cart. Such an outfit with one horse hitched to it will go almost any place, regardless of low-hanging branches, steep hillsides or rocky ground. Two men will operate this outfit, one to spray and one to pump and drive. Do not attempt to operate more than one lead of hose with a hand pump.

KNAPSACK OUTFITS.—The compressed air knapsack pump has its uses in spraying bushes, plants and potatoes. The manufacturers should either quit recommending their use for spraying trees or else make more durable tanks. Some of the "new improved" nozzles for knapsack pumps are worthless. It is my practice to take them off and use a regular sized nozzle, such as is used on larger outfits. A two-foot rod attached to the short piece of hose furnished with pump will be found helpful even for ground work.

CARE OF OUTFIT.—Sometimes when the farmer gets out his spraying outfit after a year's disuse he finds he can use it only with difficulty, if at all. He will get the idea that spray pumps are like dry batteries—wearing out when not in use. Before storing outfit for the season the barrel or tank should first be thoroughly washed, after which several buckets of clean water should be poured in, and pumped out till spray coming out of nozzles turn clear. Then open all drain cocks. Be sure to drain all departments of pump, suction pipe, rods, hose and nozzles. Freezing of water in outfit will prove disastrous. Valve caps and all threaded connections should then be unscrewed and oiled. Replace them lightly, but do not screw tight till ready to use again. Even with the best of care spraying outfits are splendid trouble makers, and after years of experience I seldom get much done the first half day. Patience is needed.

CARE OF MATERIALS.—Spray materials are sometimes lost through neglecting to take care of them. Those in powdered form should be kept dry. Those in paste form should be kept from drying out by pouring a little water over the material, as the top becomes dry. Also they should be kept from freezing. Moderately freezing temperatures will not injure concentrated lime-sulphur. I have safely stored barrels of it in the barn with a little straw or fodder about the barrels for protection. I have even seen barrels of this material lie outside all Witner, but I do not consider this proper care.

LABOR PROBLEMS.—Labor shortage may be a thing of the past before another season, but skilled farm laborers and orchardists are not likely to be hunting jobs just yet. Poor help is sometimes about as bad as none at all, and especially is this true when spraying. Any good stout fellow can handle the pump handle, but the proper manipulation of the rod is not so easily acquired. As to number of hands required, no more are needed for spraying than for other departments of farm or orchard work. Therefore the regular force will be sufficient if they can be trained to do good work. Two men with a barrel outfit can apply 300 to 500 gallons a day. Do not attempt to operate two leads of hose with a hand pump. It takes a strong man to keep up sufficient high pressure for a whoel day. A boy cannot do it properly. The larger power outfits require three men, two to handle the rods and one man, or boy, to drive. I find, however, that the average farm laborer does not appreciate the spraying job and will "get out of it" if he can. They can scarcely be blamed, for spraying is an ugly job at best.

DISCOMFORTS OF THE WORK.—Some people fear that actual physical injury will result from coming in contact with various spraying materials. Part of this fear is imaginary and part of it is real. Arsenical sprays are of course poisonous. Yet I have inhaled the mist day after day without ever experiencing any ill effect. I do not believe there is much danger from this source. Evidently the liquid is too dilute to cause injury in such small quantities as a person would inhale while spraying. But the lime-sulphur spray is a different matter. It is not actually poisonous, but because of its caustic effect there is danger of physical injury, both externally and internally. This liquid even in dilute form will eat through the skin much faster than whitewash, because it is just that much stronger. A drop of it in the eye will cause any man to dance a jig. Inhaled, it sometimes causes irritation of the throat and, perhaps most unpleasant of all, it is frequently the cause of an "upset" stomach. I have suffered all of these injuries at some time or another, yet most of them were the result of not properly protecting myself. Much more of the liquid will naturally fall on the operator while spraying high trees than low trees. No leaks should be allowed in hose or rods. Stop and repair them. Good leather gloves should be worn. Hands and face should always be

greased with vaseline before beginning work. When at all practicable the spraying should be with a light breeze blowing and then spraying only one side of the trees. The other side can be sprayed at some other time when the wind is opposite. Thus no one need actually be afraid to tackle the spraying job if proper precautions are taken to prevent physical injury. Much of the difficulty attending spraying could be avoided if orchards were planted and cared for with the thought in mind that spraying must be done. Orchards planted on steep hillsides, trees too close together and allowed to grow skyward are mistakes which make spraying more difficult or even impossible.—David Plank in Rural New Yorker.

BEAN DISEASES

nI many section of the Dominion bush beans are now recognized as a profitable special crop, and the acreage has been greatly increased during the last few years. Approximately 100,000 acres are planted yielding considerably over one million bushels. Destructive diseases have accompanied this increase in cultivation and unless the farmer takes precaution to eliminate disease the crop will not continue to be as popular or profitable as it should. tI is safe to say that probably 25% of the crop is frequently lost through the attacks of one or more diseases which might be largely prevented by planting disease free seed. The more important diseases are as follows:—

Anthracnise is probably most destructive in the Maritime Provinces and Quebec and some years in Ontraio. It is caused by a seedborne fungus which attacks stem, leaves, pods and seed, producing a dark brown to almost black sunken spots on the stem and pods and a blackening of the veins in the leaves. When severe the plants may be completely defoliated or even completely destroyed leaving skips in the row.

Bacterial Blight is a serious problem to the bean growers of Ontario and to a less extent elsewhere. The bacteria or germs causing this disease are seed-borne and attack the stem, leaves pods and seeds, producing on the seed light yellow blotches sometimes involving the whole seed. Infected leaves develop small irregular water soaked areas, which later turn brown and fall out. The spots on the stem and pods are of a raised, water-soaked appearance with a yellow to reddish amber color, usually smaller ·t so dark as Anthracnose spots.

Rust and root of beans occur less frequently, but nevertheless are capable of causing serious loss. In many caes these may also be carried on the seed.

Mosaic: This is a neww disease which was reported as common in Southern Ontario last year. The leaves on infected plants develop a peculiar mottled appearanace. Disseased plants produced a few small pods as compared to healthy plants. Little is known concerning it. Its nature would indicate that seed from affected plants would probably produce a diseased crop, therefore the use of such seed should be avoided.

Control Measures

Plant only disease free seeds on soft which has not lately been planted to beans. This can be best accomplished by selecting, at the time of harvesting, disease free pods from vigorous high yielding plants. These selected pods should then be immersed for not more than three minutes in disinfecting solution, allowed to dry off and stored in a clean muslin bag or other disease free container. The seed from these pods should be used the following spring to plant a bean seed plot. While this is not sufficiant to ensure the obtaining of disease free stock the first year, it will if practisel regularly reduce disease to a minimum and thus largely remove the cause for poor yield.

Where pod selction has not been previously practised the first start should be made by securing seed from a field relatively free from disease. This stock should be very carefully hand-selected, removing all spotted or even slightly discolored seed. After this has been done the seed may be immersed in solution of copper sul- 1:100 for 3 minutes or in a formalin solution 1:300 for 5 minutes, allowed to dry and planted.

Beneficial results might also be obtained by puiling out and destroying diseased plants as they appear from time to time during the growing season.

So far spraying beans has not proven a commercial success but probably might be used to some extent in helping to prevent the spread of disease in seed plots.

Cultivating, hoeing or picking beans while the foliage is wet should be avoided as the disease is readily carried from diseased to healthy plants under such conditions.

Most Accurate Ever Invented

Are you content to go on in the old-fashioned way using all your available farm help planting by hand, limiting your acreage because of labor scarcity, and keeping your help away from other pressing work in busy season?

Get an O-K Canadian Dial Planter and get your planting done accurately without seed waste and in a fraction of the usual time.

The O-K Canadian is the only planter that has the endless cup seed dropping device. It does not pick or bruise the seed. It is noted for being the most accurate system yet invented.

From the roomy steel hopper the seed is picked up by cups and deposited on revolving dial plate. This makes it simple to make any corrections necessary. Absolutely one piece of seed goes to each hill, thus making your seed go farther. Five years' tests demonstrate accuracy close to 100 per cent.

O-K Canadian Potato Planter

The O-K Canadian has equipment for correct depositing of fertilizer. Furrows are opened by two shoes. The first opens a trench to receive the fertilizer. The second shoe opens the furrow deeper, mixing fertilizer thoroughly with earth, thus protecting seed when dropped. This is correct and necessary for proper fertilizer results.

You certainly ought to get full particulars about the O-K Canadian, the machine that will enable you to put in more acreage into this profitable crop at low cost. Write to-night for free literature giving full particulars of O-K Canadian Planters and Diggers.

SEED IMPORTATION REGULATIONS

Canadian farmers and gardeners are protected from the evils of planting inferior seed of many kinds of crops imported from other countries. By an order-in-council that came into effect in the autumn, importation is prohibited of unfit seed of clovers, grasses, vetches, rape, other forage plants, field root and garden vegetables in lots of ten pounds or more.

In Pamphlet S-12 of the Seed Branch of the Department of Agriculture at Ottawa, and obtainable from the Publications Branch, unfit seed is described as that which does not comply with the Seed Control Act requirements respecting the sale of seed in Canada, or if it has been refused admittance into any other country on account of low vitality.

The regulations will be carried out through the Custom's officials who are required to take and forward to the Dominion Seed Laboratory for examination, sample of lots of seeds of the classes named entered for consumption in Canada. Seed that has arrived in Canada and found to be unfit shall be deported under Customs supervision. The penalty for failing to comply with these regulations is $500 for the first offense and not exceeding $1,000 for the second and each subsequent offense.

THE TWENTY LARGEST YIELDING VARIETIES OF POTATOES

With but four exceptions all of the twenty best yielders at the Fredericton Experimental Station, are white skinned and of either the Green Mountain Cobbler or Burbank type.

The highest average yield for three years (487 bushels per acre) was obtained from Seedling 13660, bred by Prof. Wm. Stuart of Washington. This is a Green Mountain type potato fairly late in maturing, of beautiful smooth appearance and high table quality. The plants also seem to be very disease resistant.

The second in the list with 496 bushels per acre (3 year average) is a strain of Delawara, improved by W. H. Moore, Scotch Lake, N. B. This potato is comemrcially a Green Mountain and in every way resembles that type except that it may be slightly thicker and not quite so rectangular. Very resistant to disease and of high table quality.

The third is Seedling 4227, bred by Prof. Wm. Stuart, of Washington, with a three year average yield of 452 bushels per acre. This potato is longish, of the Burbank tape, and of high table quality.

The fourth is Seedling 3073, bred by Prof. Wm. Stuart, of Washington, with a three year average yield of 427 busels per acre; it is similar to Seedling 4227.

The fifth is New Scotch Rose with an average yield for six years of 422 bushels per acre. This is a large pink tuber slightly inclined to be rough and not of the highest table quality, though very good. It is quite disease resistant.

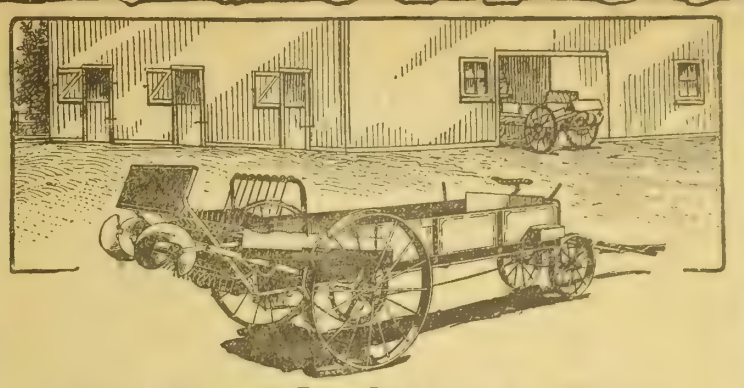
The sixth is a blue black potato following the Kidney type, bred by Dr. Whitney, St. Stephen, N. B., and developed at the Fredericton Station. It is practically indistinguishable from a variety known as McCullogh. Very disease resistant and a vigorous plant, it is a great keeper and of excellent table quality. The average yield for three years was 415 bushels per acre.

The sexenth is Dreers Standard, a long white (Burbank) type of excelelnt quality but not so disease resistant as those above with an average yield for six years of 414 bushels per acre.

The eighth is Green Moutain (Lowell's strain) with eyes a trifle deeper than the other strains of Green Mountains, but otherwise just as good and the plant is much more disease resistant and more vigorous. The four year average yield was 410 buhsels per acre.

The ninth is Irish Cobbler with a four year average yield of 406 bushels per acre. This potato is an early maturer and has the two peculiar qualities of yielding tubers that are always dry and good no matter how young they are dug and which will keep hard and dry until the following June. The eyes are rather deep and when yielding heavily it is liable to grow rather rough and have hollow heart.

Then following in order of yield we have Langdorthy with 399 bushels, Morgan's Pink Seedling 397, Vick's Extra 396, Cumming Pride 389, Eureka Evtra Early 385, Early Everett 379, Houlton Rose 375, Wee McGregor 375, Pieremont Seedling 372, Empire State 370 and Dalmeny Beauty 365. This last list was all tested for six years.



Fertilize the Whole Field

ONE great feature of the **McCormick** spreader is that it fertilizes every particle of soil, spreading an even coat of manure, light or heavy as desired, up hill or down.

This evenness of spreading is due to **McCormick** design. The reversing apron is driven by a worm feed which maintains the same relative speed of apron to beater at all times. The manure is thus fed steadily to the beater, which tears it into small pieces and delivers it to a spiral beater. The spiral gives the manure a second beating, makes the pieces still smaller and spreads evenly beyond the wheel tracks. Each particle of the soil is thus properly fertilized, and the whole field put in condition to produce a bumper crop. No manure is wasted. A **McCormick** spreader makes twenty loads do the work of forty spread with a fork.

McCormick spreaders are made in three sizes. No. 8 is a 49-bushel machine; No. 5, 55 bushels; and No. 6, 63 bushels. All are of the popular low type, with narrow boxes, cut-under front wheels, and strong steel frames.

See the **McCormick** local dealer, or write the nearest branch house for catalogue and full information.

63

DAIRYING.

STARVING COWS FOR PROTEIN

We may find dairy farmers feeding rations low in protein this winter. It has come about in this way. The price of protein appearing rather high leads these men to prepare for their cows home grown rations consisting of silage, timothy hay, oats, corn and barley. If a liberal allowance of corn silage, timothy hay, and 8 lbs. of a mixture, equal parts by weight, of ground oats, corn, and barley are fed to a cow, she will be supplied with just about enough protein to produce 15 lbs. of average testing milk. A cow in reasonable flesh will draw upon her body and produce more milk than this for a short time, but the protein in the ration is so low that her production will ultimately fall to 12 to 15 lbs. of milk a day.

There is no profit in this sort of feeding and the reason a cow does so poorly is because the ration lacks in protein. If these farmers would feed a pound or two per day of some feed rich in protein like oil meal, cottonseed meal, gluten feed, distillers grains, etc., the cow with roughage and 7 or 8 lbs. of grain could produce 25 lbs. of milk instead of 12 to 15. Further, she would sustain her milk flow longer and remain in better physical condition and produce a stronger calf. It is not wise to limit a cow in the amount of protein she receives as it is impossible for her to produce profitable flows of mlik unless this element is supplied in abundance.

Some farmers have purchased large quantities of oat hulls, which is a feed low in nutrients. These oat hulls were purchased because they were mixed with other feeds and sold for about $25 per ton. We have found rations, where oat hulls made up the larger percentage of the meal portion, that did not contain enough protein to produce over 9 or 10 lbs. of milk daily. It is no wonder these dairymen complain that there is no money in dairying. There are many good mixed feeds on the market and most of them have a place. It is not wise for a dairyman to buy a feed because it is cheap or rich in carbohydrates when he has nothing but corn silage and timothy hay to feed with it. If he has clover and alfalfa hay, then such a mixture is advisable, but with timothy hay and silage a mixture rich in protein is required.

A dairyman should first find out what he needs to balance his ration with those he has on the farm and then proceed to buy the feed in the market which will meet his requirements. It should ever be borne in mind that in order to produce liberal flows of milk, a cow must be supplied with adequate supply of protein. If it is not provided in the roughage portion of the ration, that is, hay and the like, it must come in the meal portion. It hhould also be borne in mind that a mixture which will supplement alfalfa hay will not supplement timothy hay. It seems strange in this age when there are such opportunities for securing information regarding the balancing of rations that dairymen can be found everywhere, especially this year, starving their cows for protein.

SHIPPING DAIRY COWS

The United States Department of Agriculture recently made an investigation among several prominent shippers of dairy cows as to their methods. These men handle from 2,500 to 4,000 head each year during all seasons and their suggestions have the value of real experience. They gave the following suggestions:

Do not ship fresh cows long distances unless in express cars under particularly favorable conditions. The expense involved naturally limits such operations to valuable pure-bred individuals. Time and time again, as a result of having been shipped shortly after freshening or so as to calve in transmit, fresh cows have been ruined so far as the next lactation has been concerned.

Milk cows of grade breeding usually are shipped by freight, and the experienced shipper selects only dry cows and "far-springers" for long shipment. Heifers which have never dropped calves and which are not due to freshen until three or four weeks after arrival at destination make good "buys" as they are of a size and condition which permits of loading the car to capacity. Furthermore, immature animals are less susceptible to injury in transit and to damage as a result of a marked change of environment.

If possible, ship only animals without horns. In case horned animals are shipped they should be tied securely or penned off in one end of the car to preclude the possibility of injuring the other animals during the trip. Similarly, when bulls are shipped in mixed loads, they should be securely penned apart from the females.

So far as possible, the stock should be shipped during cool weather, as cows handled during hot weather are liable to shrink in milk flow during the lactation period as a consequence of such a trip.

Special precaution must be exercised in shipping cows during codl weather, to avoid exposure which will favor the contraction of pneumonia, usually a fatal disease among mature cattle. At best it takes an animal bout a year to become thoroughly acclimated to a warmer or colder climate, and on that account the movement should take place when the temperature of the two points is as nearly similar as possible.

Dairy cows should be handled under normal conditions before and during the trip. They sould be fed and watered at regular intervals; and if any of the animals are in milk, they should be milked on schedule. It pays to feed ensilage and hay during shipment if the cows are accustomed to these roughages. Simple provision for the feeding of these materials can be made by stretching small-mesh hog wire along the side walls anad ceilings so as to form a wedge shaped bunk which can be filled with hay and ensilage in proportion to the appetite of the cattle. Grain is a difficult material to feed in transit in a freight car where no special provisions are made to prevent wastage as a result of the tendency of the animals to move about when not fastened in place. In long trips grain may be carried in the car and fed at points where the stock is unloaded.

Several large barrels fo water as well as plenty of feed should be carried in the car as protection against delay or accident which may detain the train and leave the animals hungry or thirsty for excessive periods.

Sand or cinders constitute the best bedding materials, and during long trips fresh supplies of these materials should be placed in the car at unloading points in case they are needed. In view of the high price of dairy cows at the present time it is imperative that every stockman exert all efforts to make for cow comfort in transit and to move the animals with a minimum of loss as a result of carlessness, lack of attention, and inexperience in the cow-shipping business.

UTENSILS THE CHIEF SOURCE OF CONTAMINATION

The fact that dirt which falls into milk at the barn is readily visible in the milk has led to the conclusion that the barn is the principal source of the bacteria in milk. The results of a study of the question by the University of Illionois, show that it is the utensils, rather than the barn, that are largely responsible for the excessive bacterial contamination of milk. The extent of the contamination of milk by the utensils is strikingly illustrated in one of the experiments in this study; when all utensils commonly used for handling the milk at the barn and in the dairy were thoroughly steamed, the bottled milk had uniformly only about 5,000 bacteria per cubic centimeter, but as soon as the steaming was omitted the bottled milk frequently contained several hundred thousand bacteria per cubic centimeter.

The cans for shipping milk are a particularly prolific source of bacteria when they are washed at the dairy and retruned to the farm without being thoroughly steamed and dried. The number of bacteria usually added to the milk by such cans is many times larger than the number that would ordinarily get into the milk at the barn; the addition of a million bacteria per cubic centimeter of milk

The Basis of Profitable Dairying

The influence of feed on the production of milk is striking. No matter how good the individual dairy cow is, the quantity of milk she yields is, within wide limits, directly dependent upon the feed she receives.

If a cow is subjected to feed of poor quality, unpalatable and indigestible, no matter how much she may be fed, she is sure to go away down in her production and will not yield any profits. Such a cow becomes a "boarder"—that is why our experts have compounded a mixed feed, properly balanced according to the needs of the dairy cow, rich in milk-producing nutrients, with a high percentage of these nutrients in digestible form.

Monarch Dairy Feed

a rich feed, but not too concentrated to feed alone and when fed liberally to dairy cows it will get the highest production possible with the least cost. There is no wastage in Monarch Dairy Feed—every pound has milk-producing value in it and more of it goes to the actual production of milk than of other feeds because such a high percentage of it is digestible.

Monarch Dairy Feed is composed of Oil Cake Meal, Cotton-seed Meal along with Bran, Barley feed and Corn feed. The mixture of Oil Cake and Cotton-seed Meals counteracts the constipation that would be caused by Cotton-seed Meal if fed alone.

Give Monarch Dairy Feed a trial and if the dealer in your district does not handle it, send us his name and we will see that you get it. By ordering early you will assure delivery when needed.

Windsor Dairy Salt
Windsor Canada
THE CANADIAN SALT CO. LIMITED

by such cans is not uncommon.

A detailed comparative study of the effect of the various other utensils at the barn and at the dairy suggests that the greatest contamination comes from the more complex apparatus, such as the clarifier and the bottle filler. In one of the experiments in this study, it was found that the pails added approximately eleven times as many bacteria to the milk as the barn influences, the strainer one and one-half times as many, the clarifier thirty times as many, the cooler ten times as many, and the bottle filler sixty times as many—a total of 112 times as many added by the utensils as by the barn factors. It seems that in an attempt to produce milk with low germ content too much stress has been laid on practices of minor importance and the influence of utensils poorly steamed and not dried has been commonly neglected.

BUTTER A HEAT PRODUCER AND BRAIN OILER

Milk-fat, when churned, is changed into butter fat, and thus becomes a valuable source of body heat, a spceial nourisher of the finer parts of the body and particularly a means of supplying oil for the busy brain. Before a man can act wisely and well he must think clearly. Before he can think clearly the brain must be properly fed and be well oiled. Such delicate and complicated machinery is found nowhere else in nature as found in the human brain. When the brain goes rong, everything is wrong with the man to whom it belongs.

Knowing these facts, we wonder that people are willing to buy a so-called substitute for butter in the form of oleomagerine because it is a few cents cheaper than butter. In all probability, for every 10 cents saved on butter, 10 times this amount will be paid in doctors' and nurses' bills.

Nature never intended mankind to use cottonseed oil or similar product as food for humans. The lower animals, with much stronger digestive apparatus than has man, find it extremely difficult to digest and assimilate the by-products of cotton.

The best and safest kind of butter is that made from pasteurized cream. Especiall is this true of butted which is made to be held for some time in cold storage, or elsewhere, before using. Butter made from raw cream is very likely to go off flavor, if not consumed within one month after making. If Canadians are to be able to do heavy and effective brain work they need to eat plenty of good butter, and to leave butter substitutes alone. If we wish to degenerate into Class B or lower, leaving butter out of the rations is one sure way to accomplish this.—Prof. H. H. Dean.

YOU CAN'T KEEP CREAM ON THE BOTTOM

In the lexicon of youth, my boy,
There's no such word as fail;
You may be late in grabbing off
The honors and the kale,
But they can't keep the good men down,
No matter where they sot 'em.
The good stuff gets to the top at last,
You can't keep cream at the bottom.

If you've got the stuff beneath your hat,
And the will to do or die,
They cannot keep you down my boy,
No matter how they try.
Just buckle to it—hit the grit—
You'll fool 'em all, dod rot 'em!
The good stuff gets to the top, some day.
You can't keep CREAM on the bottom!
—Meadow Gold Messenger.

GET RID OF CULL DAIRY STOCK

Every dairy breed produces a number of undesirable animals; and now is the time for the close culling of our pure bred herds, while the culls will bring twice as much for beef as in normal times. In season and out of season I have advocated close culling; for with the high prices for feed and labor it is an economic waste all round to keep an unprofitable cow. We keep cows for milk; the calf is a by-product. No cow not returning a good profit on milk produced should be retained as a by-prduct producer. We may be sure that for the next few years the number of cows and heifer calves slaughtered in Europe for meat will be les sthan normal, and that the shortage will be made up by meat importations. We shall get our share of the trade, and it will have its effect on the market price to be obtained for cull stock. Then if you have not done so already, clean up now; you wil lnever have another opportunity like the present.

The sum of $16,000 was recently paid by Messrs. Vermack Brothers, of Capetown, South Africa, for Kopjes Kraal Marthus 3rd, a young Holstein-Friesian bull, which 18 months previously had been bought by the vendor for $475. This young bull was among the leading prize-winners at the Natal Royal Show, held in June last, and comprised one of the offerings in the $500,000 pedigree stock sale, held the last week in September, by Messrs. Roderick & Co., Ltd., of Bloemfontein.

In skimming a hundred pounds of 35 per cent. cream, 15 more pounds of skim-milk is kept on the farm than when the same amount of 20 per cent. cream is taken. This saving can be accomplished by a turn of the cream screw, and at present feed prices is well worth the effort required. More skim-milk on the farms also means more calves raised to furnish meat and milk for all. Milk producers are paid for the butter-fat in cream; not for the water and other constituents. This makes it advisable to skim a rich cream, so that as much valuable skim-milk as possible may be saved for feeding purposes.—U. S. Food Administration Bulletin.

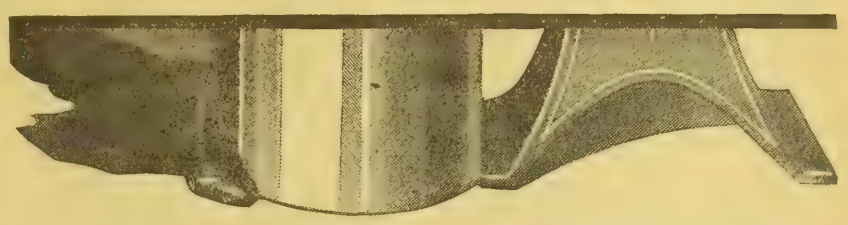
Eight Good Reasons
Why You Should Buy a
DE LAVAL


GREATER CAPACITY: New capacities have been increased 10% without increase of speed or effort required in operation.
SKIMS CLOSER: The improved bowl design, together with the patented milk distributor, gives greater skimming efficiency.
EASIER TO WASH: Simple bowl construction and discs caulked only on the upper side make the bowl easier to wash.
EASIER TO TURN: The low speed of the De Laval bowl, the short crank, its unusually large capacity for the size and weight of the bowl, and its automatic oiling throughout, make it the easiest to turn and least tiring to the operator.
THE MAJORITY CHOICE: More De Lavals are sold every year than of all other makes of separators combined. More than 2,325,000 are in daily use—thousands of them for 15 or 20 years.
TIME TESTED: The De Laval was the first cream separator. It has stood the test of time and maintained its original success and leadership for 40 years the world over.
EQUIPPED WITH SPEED-INDICATOR: Every New De Laval is equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed, full capacity, thorough separation and uniform cream at all times.
SERVICE WHEN YOU NEED IT: The worldwide De Laval organization, with agents and representatives ready to serve users in almost every locality where cows are milked, insures the buyer of a De Laval quick and efficient service whenever he needs it.

LIVE STOCK.

A TREATISE ON BLACKLEG

Blackleg, also called blackquarter, quarter-ill, symptomatic anthrax, and is also known in France as charbon symptomatique, is an infectious disease, confined mainly to young cattle, from about six months up to two years or two and one-half, and may also attack sheep, goats, rabbits and pigs. but is innocuous to man.

This disease is due to the germ the bacillus of blackleg, and belongs to the anaerobic aerogenic class of bacteria.

Analobic bacteria are those that live and multiply best without air, and this disease is never found affecting an animal in the vicinity of an open wound, although the germs may enter the system through an abrasion of the skin.

And is called aerogenic because it is one of the germs that produces gasses in the tissues, these gases are always found in the swellings of blackleg, and are the cause of the rattle or crackling sound made when the hand is passed over the swelling, and will come out in bubbles when the tumor is cut into.

Seldom are very young cattle affected, probably from the fact that their diet at this age consists chiefly of milk, and I have found that the older the animal is, the quicker it will succumb to this disease.

The period of incubation, or in other words, the time between when the germs enter the system and when the disease manifests itself, is from two to seven days.

The germs are found in the soils and pastures, and appear to be most prevalent in low wet and undrained places, and the hay and grasses cut from these places may retain the germs or their spores, and the animal may become infected in the stable in the winter time.

Animals do not get blackleg from contact with affected animals, but from the soil or pastures where the disease exists, although it may be by artificial means transmitted from one animal to another.

The germs may gain entrance into the system by either food and water, or through abrasion of the skin, and germs may get into the system by the mouth due to irratation caused by the shedding of the milk teeth.

Usually, the first thing noticed is one or more dead animals in the pasture, or an animal may be noticed away from the rest of the herd and lying down, very dull, with no appetite, and if not already, there will, in a short time, be enlargements from either on the neck, flank, head, or on one leg, and in which case the animals will show lameness (this lameness is sometimes taken for an injury.)

This term blackleg or blackquarter is somewhat misleading, as quite frequently the swelling is found on the neck or side of the animals, or, as I have found it several times, on the back just above the kidneys.

These swellings are at first quite hot and painful, and if pressed on or manipulated with the fingers have a rattle or crackling sound, if cut into the tissues are found to be of a dirty brow nor nearly black color, and will contain bubbles of gas. In a great many cases, the tissues show streaks of healthy and then black looking muscles and it will be noticed that when cutting into the tumors when the animal is living the skin may show a little tenderness, and the rest of the operation is painless.

All carcasses of animals dying from blackleg should be either burned or buried as soon as possible after death, and should not be removed away any more than is necessary, as it would be the means of scattering infection. While burying will not destroy the germs inside of from six to eight months, it will prevent dogs and coyotes from carrying pieces around the pasture, thereby leaving more and new infection for other outbreaks later on.

As this is up to the present time practically an incurable disease, I say practically because a few cases have been cured, we have to look to the preventive measure, which is vaccination.

There has been on the market for some time a vaccine in pill form, also one which was used with a few inches of tape which was jabbed into the animal; this last method was in my mind the most crude and impractical ever tried. There is now on the market a vaccine called liquid germ-free blackleg vaccine and is, I would say, the most rational and the safest vaccine to use.

While not going into the method here of the preparation of these two forms of vaccine, that is, the pills and the liquid form, it is sufficient to say that they are made from the tissues of animals that have succumbed to blackleg; the pills contain the dead bacteria, their spores and toxins, while the liquid consists of the toxins only, and does not contain any germs, either dead or alive.

Although these pills have been used for a number of years by stockmen with fairly good results, there has been various fatalities following their use, as to saying these pills the cause of death, we cannot, although I believe that in many cases they are.

There are four factors any one of which might be the cause of death following vaccination with the pills.

First, we will say that possibly the needle was dirty and set up septicemia(or blood poison) and such a case would or might be a little difficult to distinguish from blackleg.

Second, that the animal was already affected with blackleg, and if so, the pill would have the effect of hastening death rather than preventing it.

Third, when a number of deaths follow vaccination, it would be possible that the needle was plunged into an animal already affected with the disease, and if then used on other animals, with out first cleaning, would be the means of affecting several succeeding animals, and, in this case, also, the pill would be of no avail.

Fourth, and the one which I believe is the most likely, and the most common is that the pill might have contained some of the live germs as well as th edead ones, thereby giving the animal the blackleg instead of preventing it. This last, and the one I believe is the most important, could never happen if the germ-free vaccine were used.

Although stockmen are more and more beginning to recognize the practicability of vaccination, there is not yet one-half the vaccination done that should be. I would strongly advise all stockmen to vaccinate their young stock in the early spring, before they are turned out to pasture, and if such were done, and the liquid germ-free vaccine used, we would, in a short time, instead of having a large number of deaths yearly from blackleg, we would seldom hear of a case.

While the liquid vaccine is no doubt a little more difficult to use, and will take up a little more time as it is necessary to use a hypodermic needle, yet this is of little consideration when the results are going to be one hundred per cent. better.

Considerable care should be taken as regards the antiseptic precautions, such as clipping the hair, disinfecting the skin and also the needle before and after each indviidual animal.

And unless the person is accustomed to using a hypodermic needle, and can keep it clean, they would do far better to engage the services of their local veterinarian, although costing a little more at the time, he will have the satisfaction of knowing that the work is done right, and the better the vaccination is done, just that much better will be the results.—By W. J. Moon, V. S.

HOW TO DIAGNOSE DISEASE IN ANIMALS

The pulses, respiration and temperature varies with each class of animal so that a knoldege of the normal rate is of utmost importance. The character of intermittent expansion of the arteries, called the pulse, informs us as to the condition of the heart and blood vessels. The frequency of the pulse beats varies in the different

Grofast Calf meeal will raise equally as good calves as whole milk at a fraction of the cost. Hundreds of tons used annually in the Province of Quebec. Thousands of testimonials from satisfied users.

Gentlemen:— Ingersoll, Ont., Feb. 8th.
I have used a lot of your GROFAST CALF MEAL during the past three years. After my calves are three days old they get nothing but skim milk and your CALF MEAL, and I raise equally as good calves as I ever did on Fresh Milk, at a fraction of the cost.
Yours very truly,
(Signed) RICHARD ARCHER.

Dear Sirs:— Calumet, Que.
I have used 500 pounds of GROFAST CALF MEAL this year and never used the like of it. My calves are as fine a bunch as I ever raised on milk.
Yours very truly,
(Signed) JAMES BENNETT.

Sold by dealers practically everywhere in 25, 50 and 100 pound bag. Complete directions in every bag.
Demand Grofast Calf Meal. Refuse substitutes to ensure best results.

This good name is further enhanced by reason of their unusual wearing qualities.

Your shoeman will be glad to show you the newest Amherst models.

Amherst Boot & Shoe Company Limited, Amherst, N.S.

species of animals. The smaller the animal the more frequent the pulse. In young animals the number of beats per minute is greater than in adults. Excitement or fear, especially if the animal possesses a nervous temperament, increases the frequency of the pulse. During, and for a short time after feeding and exercise, the pulse rate is higher than when the animal is standing at rest.

Normal Pulse Beats

Horse	36-40 per minute
Ox	45-50 per minute
Sheep	70-80 per minute
Pig	70-80 per minute
Dog	90-100 per minute

The horse's pulse is taken from the submaxillary artery at the point below the angle of the jaw. It is here that the artery winds around the inferior borders of the jaw in anupward direction, and because of its location immediately beneath the skin, it can be readily located by pressing lightly over the region with the fingers.

Cattle pulse is taken from the same artery as in a horse, although it is not so easily located, because of the mass of muscular tissue.

The sheep's pulse may be taken directly from the fermoral artery by placing the fingers over the inner region of the thigh. By pressing with the hand the region over the heart we may determine its condition. The dog's pulse can be taken in the same region.

The dog's pulse is usually taken from the brochial artery. The pulse wave can be readily felt by resting the fingers over the inner region of the arm and just above the elbow.

Respiration

The frequency of the respiration varies with the species. The following table gives the frequency of respiration domestic animals:

Hore	8-10 per minute
Ox	12-15 per minute
Sheep	12-20 per minute
Dog	15-20 per minute
Pig	10-15 per minute

Body Temperature

There is a wide variation in the body temperature of domestic animals This is especially true of cattle, sheep and hogs. In order to determine the normal temperature of an animal, it may be necessary to take two or more readings at different times, and compare them with the body temperaures of other animals in the herd that are known to be healthy.

Exercise, feeding, rumination, excitement, warm, close stables, exposur eto cold, and drinking ice water are common causes of variations in the body temperature of domestic animals.

The average normal body temperature of domestic anlmals are as follows:

Horses	100.5 degrees F.
Cattle	101.4 degrees F.
Sheep	104.0 degrees F.
Swine	103.0 degrees F.
Dog	101.4 degrees F.

INTERNAL AND EXTERNAL PARASITES OF SHEEP

"Tuberculosis is practically unknown among sheep, and they are free from many of the contagious diseases prevalent in other farm animals, while Canada is freer from sheep diseases than any other country." This was the opening remark made by Dr. D. C. McGillivray, of the Ontario Veterinary College, in his address at Toronto before the Canadian Sheep Breeders' Association on maintaining a healthy flock of sheep for productiveness. Such a statement—coming from such a recognized authority should give confidence and encouragement to greater efforts for sheep breeding in Canada.

The speaker said that in selecting the areas suitable for sheep, the high and dry places should be made to get away from the low lying marshy land, or drainage should be resorted to if such places existed on the farm.

External Parasites

Parasitic diseases were most common in low lying marshy land, and they were the cause of the greatest loss amongst sheep. Parasites were of two classes, external and internal. The external ones were lice, ticks and scabmite, and none of these should be in existence at all a sthey could be stamped out by dipping. The carelessness of a few farmers in this matter was enough to keep the whole sheep industry in a continual war against external parasites. There were a number of commercial dips on the market and a number of artificial ones that could be home made; all were good when properly used. In coal tar dips it had been found much more effective and benefical to the wool if soap was added. Lime and sulphur dips had a tendency to spoil the texture of the wool. The best time to dip was immedaitely after clipping but dipping should be done every time it was necessary either as a preventive or as a cure. If fall dipping was done a warm day should be chosen or a warm place to herd them in till they were thoroughly dry.

Internal Parasites

Internal parasites were round worms, tapeworms, nodular worms and lung worms. One striking remark he made in preference to the eradication of all parasites was: "the price of safety is eternal vigilance." The purchase of rams was one of the chief causes of spreading the diseases arising from worms. Certain districts were badly affected and lung worm dsease was imported by buying sheep from these districts, and once a pasture was affected it was impossible to clear it from the pest. Lung worms showed their first signs in the lambs, by their commencing to cough. It was not found in lambs up to six or seven months old, but reached its heights at nine months old. Farmers who went in for selling fat lambs should get them on the market before they were nine months old. Weaning time was the period at which lambs were most liable to be affected, and for a cure, Dr. McGillivray advocated the injection of turpentine into the windpipe.

The nodular worm confined its work to the small intestines and the chief cause that gave rise to this form of parasitic disease was feeding on low swampy land. Feeding of salt to sheep had a great effect in ridding them of parasites. Fluke disease was particularly free from Canadian sheep but the ordinary stomach worm was very prevalent, and the most destructive among sheep in Canada. For stomach worms the best agent was the oil of turpentine, and half an ounce was about the average dose for a sheep. Ground blue stone had also proved its beneficial effects with stomach worms; a teaspoonful for every sheep, mixed with the feed was the quantity sufficient to free affected animals of stomach worms.

Foot rot could largely be controlled by dipping, but for its prevention, the hoofs of the flock should be examined and any overgrown or ingrowing hoof that collected dirt should be pared off. Restrictive measures should be adopted to prevent sheep affected with lip and leg ulceration from being taken from one place to another as it was very contagious. Every sheepbreeders' association should be acquanted with infected districts and no animals should be purchased from such a district.

ELEVATOR SCREENINGS GOOD FEED FOR HOGS

In order to test out the feeding value of recleaned elevator screenings, a pig feeding trial has been carried on at Brandon Experimental Farm. These screenings are now graded as "Standard Stock Feed" and were formerly known as "Grade A" screenings. They consist chiefly of broken and shrunken wheat, wild buckwheat, oats, flax and other edible seeds and only a very small percentage of chaff and small weed seeds. This feed was bought at Port Arthur for $35.00 per ton; freight hauling and grinding raised the cost of it to $42.00 per ton delivered at the Farm.

They were tested against Barley chop at $45.00 per ton as the main feed, and a series of 12 experiments were carried out. The pigs were all of the same age and a very uniform lot consequently very good results were obtained.

The average of 6 lots for which screenings were the main feed were:
Lbs. grain to 100 lbs. gain of pork 453
Average daily gain per pig....1.54 lbs.
Lbs. grain to 100 lbs. gain of pork.....453 "
Cost per 100 lbs. gain..... $10.34

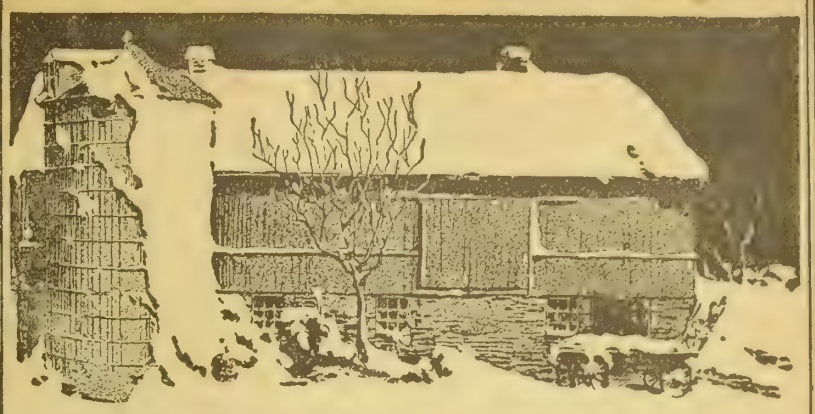
Average results of 6 lots for which barley was the main feed:
Average daily gain.... .....1.5 lbs.
Lbs. of grain to 100 lbs. gain of pork.....4.46 "
Cost of 100 lbs. gain..... $10.68

The lots on screenings ate more than those on barley, showing that the feed was palatable. They made slightly larger gains but took more feed to do it.

From this test and previous ones in which similar resutls were obtained, the conclusion was reached that for finishing pigs screenings of the type described are fully equal to barley.

Therefore it would appear that if a uniform grade of screenings can be obtaned they are worthy of a trial by the farmers of Eastern Canada, especially when feeds are as expensive as they are at present.

One difficulty found with screenings in past years has been that they were not uniform; one carload would be good and the next almost useless. But if the Federal Feed Division can give the farmers any assurance as to the quality of these screenings they can rest assured the farmers will buy them.



SNOW TIME
is when you need an
IDEAL GREEN FEED SILO

NOW is the time when you need an Ideal Green Feed Silo. These cold, wintry days when your milk flow shrinks if your cows are on a dry feed ration make you wish that you had installed an Ideal Green Feed Silo last year.

Authorities agree that cows will give 25% more milk on a silage ration than on dry feed with grain, and a silage ration is much cheaper than a dry ration.

Plan for your Silo NOW

Before you know it the rush of spring and summer work will be on you again, and if you let the matter drag along you will probably come around to another winter and still not have a silo.

An Ideal Green Feed Silo will preserve your silage better than any other silo made, and will last longer. Thousands of Canadian cow owners have proved this to their own satisfaction.

Write today for our large illustrated catalogue, which shows every detail of this silo and gives much valuable and interesting information about silos and silage.

MANY INTELLIGENT HORSES ARE SPOILED IN TRAINING THROUGH BAD MANAGEMENT

There is a false idea abroad among many teamsters and would-be horsemen that a certain amount of harsh treatment and horse lashing has to be done to cure a horse of shying, balking and similar vices. These vices are the offspring of a natural train in the horse that is an heirloom from his progenitors in the wild state and when this fact becomes better realized, the cruelty to horses in the training, should cease to exist. The horse that balks and shys at every little harmless object in sight has been spoiled by mistreatment of some kind. More than likely the owner has whipped him at one time for doing this very thing. A horse should never be whipped for shying for it will make him more shy, because he will always have a fear of being whipped again for a similar offence.

The abuse of the whip is the cause of many pronounced cases of vice amongst horses, or, in other words, it accentuates the horse's natural tendency to self-defence. The only method the horse in nature employed in self-defence was to run or refuse to go near anything that gave the least sign of danger. And the whip, when unmercifully used, only increases the fear. It can be used with judgment to persuade the horse to be prompt and obedient; but when a thrashing is given a well bred colt never forgets it. This makes it all the more necessary that the horse must know what he is getting the ordeal for, but to lash him for shying at supposed danger is nly to make him more afraid next time. Caress and encourage the horse and show him there is nothing to fear—he will walk up, take a good look, snort and walk on; then the next time he will just look and a word of encouragement will send him along.

The Trainer Void of Horse Sense

The value of horses, more especially the light legged class, is much enhanaced by their fearlessness on the road and their acquaintance with bad treatment generally meted out to the shying horse by its driver.

There are still too many men entrusted with the charge of horses, of the type that seem to delight in their ignorance of the art of true horsemanship. They give occasional exhibitions of their brainless condition when getting ready to leave church after service or similar gatherings. They get aboard the buggy while the horse is quietly waiting, then the racket commences. Whoa! and lash come in alternate rounds, while the sister or mother wait until the storm subsides. Just by a fluke chance they get seatde ; respect for them does not count when the brainless exhibition is on.

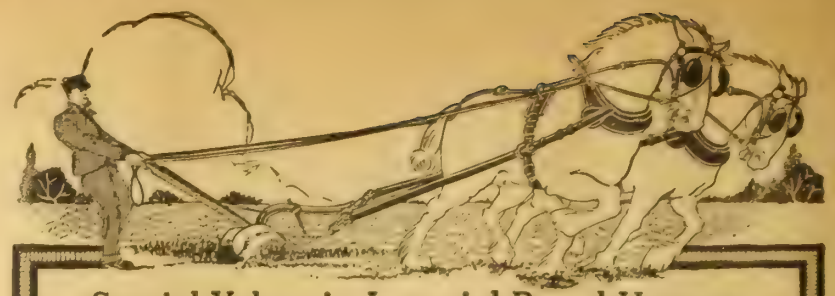
It is the highest accomplishment in the art of home training to make a horse stand and stand quietly till passengers and driver are ready. At every hitching up this should be practiced, even when the driver is the only passenger or however urgent or hurried the call for the journey may be.

There is that intuitive sense between horse and man, sometimes a wireless connection, but at all times it can be sent over by the reins. It is in reining of a driving horse or a wagon team, that the secret of the management lies. A driver should never touch a horse with the whip while the horse is waiting for the sendoff. The properly trained horse is waiting t get his order every time, but when a driver does not sense the ability in the horse to draw deductions, then he is down and out as a horseman ,and fails to get all the utility that a horse is capable of giving. It is entirely the fault of the horseman if a horse will not stand. The horse fears the onslaught he gets every time. A horse that has been spoiled in this manner is never again safe from a sudden bolt or shy.

Often we find horses shying without any apparent reason, and forget that the horse, ever on the alert as to the conditions of his surroundings uses more senses than that of eyesight. In nature their sense of smell is very keen and anything objectionable or smells somewhat akin to animal that has been the hereditary enemy of the horse, he instinctively shies. Young horses that are being or have just been broken in are very apt to shy more or less at various objects until they become thoroughly familiar. If judiciously managed this natural nervousness will soon wear off and familiarity will breed contempt.

A colt should never be frightened; if taken in time and properly handled, he need never know fear. Running after them, and "shooing" at them and the like, makes their training all the more difficult when that stage comes. Such colts that are so herded and frightened never become reliable horses when taken on to the team work on the farm. A colt should only be taught useful lessons, and though the thoughtless may frighten a colt unintentionally, the ordeal is not readily forgotten by so sensitive an animal as the horse. Neither should one make the mistake of trying to teach the colt too much at one time; he should nuderstand each lesson thoroughly before a secnod is attempted. A certain amount of order and regularity should be kept up, a little every day or succeeding days, and not at irregular intervals, at the whim of a would-be trainer. Gentleness and firmness at all times must be practised, and whatever is attempted must be gone through with.

Far too little regard is placed on the training of the mouth, and no particular attention is paid to the hardening process so necessary, not only to the training but the health of the horse. The hands, the rein, the bit and the mouth are the four items of prime consideration in the early stages of the colt's training. No hitching up should be done, and little progress will be made, until the colt gets acucstomed and understands what it all means. The horse's mouth must be trained to be responsive, and on this point the horse is generally subjected to more cruel treatment than from all other causes in training put together. To a large extent a good mouth is natural to a horse, and when thoroughly hardened, by gradual stages, to the bit, he will understand and respond promptly to the slightest movement of the rein. There is no necessity at any time to jerk a horse's mouth; it is an act that will undo any training that has been done on correct lines. The tender and bad mouths result from improper handling. They cause many imperfections, dihealth, and lessen the pulling power of the farm horse. The natural gift of a horse is changed and spoiled very often from bad usage with bitting and a consequent tender mouth. This is occasioned by the horse having to hold his head in such a way as will save the bit from iritating some part of the mouth. Tongue lolling, crossing the jaws and many other defects



Special Values in Imperial Brand Harness
Sold by Reliable Harness Dealers in Every Town
Our No. 426 Special Team Harness is made for heavy farm work. This is a favorite all over Canada. If your dealer does not carry it he can get it for you, so you can see it before you buy it, or you can write us.

Helps Your Horses - Saves You Money
The horse is a vital factor in greater farm production. To realize the best results he must be kept one hundred per cent. fit.
STUFFED COLLAR PADS
Filled with our Special Composite Stuffing
are the only guarantee against bruised, galled and chafed shoulders. They are better than other kinds, being soft, springy and absorbent. They also make possible the continued use of a horse collar long after its worn condition would otherwise compel its discontinuance.
NEW PATENTED HOOK ATTACHMENT
(Found Only on Pads Made by Us)
Consists of wire staple with felt washer. It gives hook a firmer hold and prevents pulling off, even though fabric is weakened by long usage. Life of pad is thus materially lengthened. This is the greatest improvement since we invented the hook.

arise from bad handling with the bit and soncequent inroad is made on the health of the animal. Long before a colt is fit to take his place in the team he should be thoroughly trained to the touch of rein and bit. When done with gentleness and firmness a colt becomes intelligent and takes pleasure in the exercise. The winter months give the opportunity and it is one of the horse breeder's paramount duties to acquire the art of training as well. There are horses that are dunces, that never will make good at work, and it is one of the aims in Cyldesdale breeding in their native land to weed out these strains. But many a sensitive animals is spoiled through the man being a dunce at the training. Study the horse; a spirited animal is the best teacher, becomes the best servant, but is easily ruined for full utility.

WHICH TYPE OF HORSE IS BEST?

reader writes: "1.—The majority of farmers in this district say that a horse weighing between 1300 and 1500 pounds is the most economical farm horse to keep. They claim that he will do more work than a 1600 or 1800 pound horse. Is this true?

"2.—What number of hours per day should a team work in the field through the summer season?

"3—How many miles per day should a team walk when plowing?

"4.—What teeth does a horse lose at four years of age? Does it affect his digestive system sufficiently to lessen his capacity for work?

"5.—Does it pay to breed a mare at two years of age and to let her run with the colt at three years of age, and not work her that season?"

1.—This uqestion asks only which type of horse is most economilcal to feed and which will do the most work. This is decided wihtout the consideration of the question of weight at all. It depends largely upon the individuality of the horse, and also upon the character of the land to be worked. We have seen big horses that could not compare with smaller horses for farm work, and we have seen big horses that could stand work much better than their smaller mates.

More definite information could be given by taking as an example two horses of excellent conformation, strong constitution, good doers and steady in harness, one weighing 1400 and the other 1800 pounds. For average farm work the advantage in the smaller horse would be that he would possibly eat slightly less feed to keep in good condition, would he handier to work around and handier in harness; wuld adapt himself better to work that required activity and movement at the trot. The advantage of the heavier horse would be in his ability to stand heavier work such as hauling machinery in heavy land, and having extra weight to exert in a heavy pull.

On this basis it will be seen that four 1800 pound horses could do the same work as five smaller ones where very heavy work is required.

nI addition to this the big horse has a derided advantage as a commercial proposition. He is worth $100 to $125 more on the market, all other points being equal. A good draft gelding weighing 1800 pounds sold in Winnipeg recently for $345. Such a price could never be obtained for a 1400-lb. horse except as one of a reaI well-matched team wanted for some special purpose. Where a farmer had nothing in view but regular farm work on average soil he would find the 1400-lb. horse most satisfactory. If, on the other hand, he had the commercial phase of the question in view he would be advised to handle the bigger, higher-priced type of horse.

2.—With average care any team should be expected to work 9 to 9½ hours per day in the field. By this we mean at actual work and not going to and from work. Many a team is obliged to work 10 hours a day in the field.

3.—Under average conditions, such as average soil, average summer weather, and an average length of furrow, an average sized team should travel at the rate of 2 to 2¼ miles per hour. nI nine hours they would travel 18 to 20 miles.

4.—Between the ages of 2½ and 3 years of age a horse loses the centre two teeth, between 3½ and 4 years the next pair and between 4½ and 5 years the outside pair. At 4 years of age a horse is often unable to stand work as well as when 3 year sold. This is due to the fact that his broken mouth prevents him from chewing his feed to advantage.

5.—Possibly on no other subject of horse breeding is there greater difference of opinion than on the question of breeding a young mare at two years of age. A few days ago the writer was discussing this matter with an experienced horse-breeder and he favored the idea very strongly. He claimed that a well-developed two-year-old filly will make a better brood mare if she is bred at two years, and if given reasonable care the following year will not be stunted in growth. He advised against breeding an under-sized filly, as under certain conditions she might not grow out after having a foal.

It would appear from the experience of several successful breeders that a well-developed filly may profitably be bred at two years of age. The following season she should not be worked, but left to run with her foal all summer.

We would welcome a discussion from our readers on this latter question.

DETECTING BLINDNESS IN THE HORSES

In a discourse on detecting unsoundness in horses, Dr. A. S. Alexander, the well known authority says, re examining the eyes: Coming to the region of the eyes remember that a deep depression above the eye, or supra orbit, as it is technically termed, is most marked in the old horse and practically absent in the young one, the part being filled with fat. To make an old horse appear younger, the "gyp" horse dealer fills the cavity with air, a trick called "puffing the glims." The finger detects this at once, as a cracking sound is emitted on handling, and in addition one will notice that the hair on the temple of an old horse has turned grey, while the lower jaw bone feels sharp and thin, and the bearing of the grinding tables of the teeth also tells the story of advancing years.

In a dark place the pupils of sound eyes dilate, so lead the horse into the light and notice if contraction of the pupils occurs. If it does not, the eyes are unsound. In blindness from paralysis of the retina and optic nerves (amaurosis, or "glass eye") the pupils are permanently dilated and the eyes consequently appear unusually bright and prominent, although the horse is "stone blind." Such a horse can look squarely at the sun without blinking.

Books and articles on the examination of horses for soundness advise that the soundness of the eye should be tested by a threatened blow of the hand. If the horse can see, he flinches on noticing the approach of the hand. otherwise there is no winking of the eyelide. This test is useless, if not very gently done. A blind horse will wink. if he feels a column of cold air strike the eye, or if the fingers touch one of the long hairs projecting from the skin under the eye. Look for these long hairs. They are called "tentacles," have special nerve endings, so are sensitive and when touched communicate the message of impending danger to the brain, and the eyelids instantly close. They serve the same purpose as the long hairs or "feelers" projecting from each side of the muzzle of the cat, and in the horse also are found in that region.

A warm bran mash given once a week will be highly relished by the horse. It must not be made too thin, but just wet enough to be moist. It is improved by adding a pint of whole oats to three or four quarts of bran.

POULTRY.

MATING STANDARD POULTRY FOR PRACTIAL PURPOSES

The term "practical" is used here in the broad sense in which it applies as truly to all things that help to create and maintain interest in poultry production as to the things which relate particularly and directly to the production of eggs and meat.

There is nothing in the nature of poultry that would prevent supplying the world with all the poultry products it could use from races of poultry not attractive to the eye and not uniform in appearance. But there is that in the nature of man which makes poultry keepers give more careful attention to flocks in which they take pride, and makes the sight of a uniform, handsome flock effective beyond all other things in extending interest in poultry culture.

Pride a Factor in Success

It is a general fact in the history of modern poultry culture that interest in poultry having distinctive appearance is essential to any marked increase in poultry products. It is also a matter of common observation that poultry keepers who are indiffrent about the looks of their stock rarely make notable success. Good work with stock that does not look good is not impossible, but what there is of it is occasional, irregular and spasmodic. As a rule the owner of a flock of mongrel-looking poultry that does uncommonly well soon begins systematic efforts to improve its appearance.

A good looking flock is a standing advertisement of a certain measure of efficiency in poultry culture. It is plain evidence open to all of skill in breeding and growing poultry; while performance, especially in egg production, is celebrated only as far as detailed accounts of it are published.

Appearance speaks for itself; performance in this line must have some one to speak for it. Sufficient attention to appearance to secure uniformity in a flock is in the highest degree practical. Experience has shown over and over that where this is lacking, interest is apt to flag and production is not maintained.

American standards for poultry express the characteristic American attitude in regard to combining beauty with utility in the individual bird and in the breed. While a few breed types show the development of superficial characters carried to extremes which unfit the breed for common use, these extreme developments are all of foreign origin, the popularity here of the breeds possessing them is very limited, and the influence of the common American demand for use with beauty tends constantly to modify extreme types.

Beauty and Utility in Combination

The American idea of utility and beauty in combination in domestic animals and birds is, that those forms and elements of beauty which are expressions of actual worth, and those which are attractive and in no way inimical to utility qualities should be cultivated, but that those which are in any measure incompatible with usefulness ought to be eliminated. The elimination or modification of characters undesirable in poultry kept for use under ordinary conditions is distinctive of breeds of American origin, and of American types of breeds of foreign origin which attain any popularity here.

The mating of poultry to conform to the American Standard of Perfection's requirements, and at the same time give good and satisfactory results in meat and egg production, is in practice a matter of progressive selection, beginning with selection for the desired utility properties It differs from ordinary selection for producing Standard exhibition stock in that no measure of merit in any exhibition quality is allowed to offset distinct lack of utility value.

This principle is not as drastic in operation as it appears in statement, for in all the popular varieties of poultry, and in most others as well, the Standard type is either a good utility type or a reasonable interpretation of the language of the Standard admits of the development of a type that is at leas not seriously objectionable from a utility standpoint. The birds rejected in this process of selectons are those which conform better to the superficial than to the substantial requirements of the Standard.

Weight a Measure of Size

The first step in this selection is the discarding absolutely all specimens that do not closely approximate the Standard weight for their breed. In any Standard breed, the Standard weights for adult male and female are the most desirable weights for breeding specimens. The weight of a bird in good breeding condition, well fleshed and firm in flesh, is as satisfactory a measure of size as can be used in selection for breeding and rigid application of the rule to use only specimens closely approximating Standard weights for adults, with due consideration of type, virtually insures that the stock will be kept in size.

The weight for adult birds should apply just the same to young birds used in breeding, for immature birds are not fit for breeding, and young birds that at maturity are much under weight are most undesirable. Rigid adherence to exact Standard weights is, of course, impractical, but it is advisable to avoid variations of more than five or six per cent. either way.

After weight, type should be considered. This must be judged with the eye. There is more room and more excuse for latitude on this point than for latitude in weight. Weight is measured by one fixed standard of measurement. Type is made up of several elements, and estimates of type must be more or less a matter of opinion. In common practice selection for type comes down to the rejection of specimens that are unmistakably off-type, to a careful matching for type of the females used in each mating, and to the mating of each male to the females which in union with him will reproduce the breed type most satisfactorily.

Consideration of Type

A proper appreciation and consideration of type as it relates to mating covers a number of points commonly treated as independent. Most important is the question of vigor and vitality as expressed in type. The Standard type of a breed presents, with a certain size and form, a carriage and symmetry which are the result and expression of vigor, vitality and a perfectly balanced structure, and are, therefore as much a part of type as length, bredth and depth of body, or length and character of neck and legs.

The vitality and perfection of type which make a bird naturally "carry itself well" are possessed in much higher degree by some birds than by others which, when stripped of their feathers, appear almost identical in form. Almost all birds can be taught to stand for inspection in a pose that shows true breed type, but a bird which does not naturally assume the poses which show its type to advantage is not desirable as a breeder, because its indisposition or inability to carry itself well at all times comes from some structural or constitutional fault which impairs its value as a producer of offspring of marked practical value.

A further test of the vitality and vigor of birds is obtained by observing how they bear unpleasant weather conditions and sudden changes of temperature, especially changes from warm or comfortable to raw, chilly weather. Susceptibility to such changes shows a lack of robustness of constitution and poor circulation of the blood. Many birds which look fine in pleasant weather appear dejected and miserable on dull days. Whole flocks often behave in this manner. However common this may be, it is not normal. Perfectly sound and healthy creatures are not so affected.

Causes of Lack of Vigor

Sometimes wrong management, putting the stock out of condition, is the cause. Bad ventilation in poultry houses, underfeeding, overfeeding—especially the too free use of highly concentrated feeds to force growth or egg production—are common causes of a condition of the system which makes poultry unduly susceptible to ordinary weather changes. Where wrong management is discovered, correct treatment will cure most birds of he habit of huddling about in dull weather. Birds that are noticeably susceptible when the environment is in all respects good ought never to be considered as breeders.

Due consideration of type on the lines indicated above automatically covers the characters and conditions of head and foot points which are coordinated with high vitality. A bird that is beyond criticism in these sections may fail to showw good general breed type and a carriage expressive

An Ideal Farm Paint

Around the farm or home, wherever you have surfaces exposed to wind, wear and weather, you can save money and the trouble of renewing things, by using Everjet Elastic Paint.

Carbon paints are the most durable of all and Everjet is the best carbon paint ever made. It is the ideal roof paint. Stops deterioration and leaks; adds a good many years to the life of a roof.

Wonderful on metal surfaces because it is elastic and will not peel or crack under temperature changes. It will keep your implements fit. Try some. You will never be without it.

of vigor, but a bird that shows these general qualities in high degree cannot be defective in the head and foot points desirable in a breeder, for if it is its general attitude and carriage are affected.

Approrpriate size and type, and the vitality that gives and expresses perfect health and condition, then, are the essentials in mating Standard poultry for praactical results. On this foundation the breeder who desires to produce birds of high exhibition quality can build with certainy that his stock wil lalso be notable for its practical qualities.—U. S. Department of Agriculture.

HATCH CHICKS EARLY IN THE MARITIME PROVINCES

(Experimental Farms Note)

From records kept at the Eperimental Fam, Nappan, as well as thorughout the Experimental Farm system, it is evident that the early hatched pullets are by far the most profitable ones. For they are producing eggs at that period of the year when the demand is greatest and the highest prices realized.

This is an important factor in successful poultry raising. When one considers the high prices paid for all feeding material the object should be to produce pullets that would lay during the winter months in order to reduce to a minimum the cost of maintaining the flock through the most expensive period of the year.

Now the question arises, "Can early chicks be produced in the Maritime Provinces successfully?" The answer is "Yes." But in order to do so the poultryman must start with the parent stock that is with the flock that is to produce the eggs.

The fertility of the egg and also the vitality of the germ must be kept to its maximum if the best results are to be obtained. This can be done only by judicious feeding and careful attention to the flock that the birds may be healthy and vigorous during the breeding season, for birds lacking in vigor and health will produce chicks low in vitality. Such chicks will not withstand the extremes in weather conditions exeprienced in these provinces during the early spring.

The eggs should be collected promptly before they become chilled and stored in a room where the temperature is about 55 to 60 degrees, avoiding extreme heat or cold. Best results are obtained where eggs can be set from two to three days after they are laid and should not be kept longer than one week, especially for early hatches.

All incubators should be thoroughly disinfected and cleaned before the eggs are set and an even and normal temperature kept throughout the period. If hens are used for setting they should be in a good healthy condition and free from lice; otherwise they will be uneasy and perhaps leave the nest and allow the eggs to get chilled. Greatest care and attention should be given them during this period.

When chicks are hatched artificially they should be put into a clean, warm brooder where the temperature wil lbe from 90 to 100 degrees. They require plenty of fresh air and as they grow older they need all the sunshine possible. With hen hatched chicks, put the hen in a coop and place it in a comparatively warm place for the cold weather.

Have plenty of clean, wholesome feed for chicks. Dried bread crumbs is an excellent feed to start on; plenty of milk may be given at all times, green feed in the form of sprouted oats or such like is most essential for young growing chicks. Don't feed too much of any kind of feed at one time, just what they will clean up in a few minutes, but feed little and often especially during the first few weeks.

Just as soon as the ground is dry enough and the days are warm and sunny let them out for a short time during the midde lof the day. Plenty of exercise is absolutely necessary for vigorous and healthy chicks. To make poultry pay, winter eggs are necessary. These can be secured from well matured pullets only and the arly chick is the only one that matures before winter. Therefore, if you want to succeed hatch early. April 1st to May 15th is the best time in the Maritime Provinces.

LIGHT IN THE POULTRY HOUSE

(Experimental Farms Note)

For some time it has been a question whether artificial light in the poultry house was a benefit or not, and to help solve the problem, the Poultry Division of the Experimental Farms have tested it for two seasons, during the winter of 1916-17 with two pens (40 birds in all) of Barred Rock pullets and during last winter with two pens of Rock pullets and two pens of Leghorn pullets (40 birds of each breed.)

In each light pen of twenty birds two tungsten 40 watt lamps were used. They were turned on at 6 a. m. and left till daylight, then turned on again in the afternoon before dusk and left till 9 p. m. This was started in November when the days became short and continued until the middle of March when light was unnecessary.

nI the 1916-17 test the light pen laid 1106 eggs with a total value of $54.93. The cost of feed was $22.53, the cost of light $2.40, a total cost of $24.73. This gave a balance over cost of feed and light of $30.20 or a cost per dozen eggs of 26.8 cents.

The dark pen laid 6'6 eggs with a total value of $29.46; cost of feed was $21.09. This gave a balance over cost of feed of $8.37. The cost per dozen eggs was 39.8 cents.

In 1917-18, the yields were not high in either case, and the total difference in egg yield in the six months was by no means large, but the forty brids with light gave a better revenue than the forty without light. This difference was made up in the time that the eggs were received. Those with the light gave their heavies yield in December and January, while by far the heaviest months far the Leghorns without were March and for the Rocks January and February.

The total figures from the two pens with the light were: Number of eggs, 2470, value $136.32; cost of feed $55.48, cost of light $3.20; balance, $77.64, or a cost of 28.5 cents per dozen.

Those without light laid 2242 eggs; value $118.90; cost of feed $60.01; balance $58.94, and cost of one dozen eggs 32.1 cents.

For both years, the light pens laid 3476 eggs at a market value of $191.25. The feed and light cost $83.41, leaving a balance of $107.84, or a cost per dozen of 28.7 cents.

The dark pens laid 2878 eggs worth $148.36. The cost of feed was $81.10. and the cost of one dozen eggs was 33.8 cents.

The conclusion may be drawn that for early winter eggs during the short days, the light does increase the egg yield but later in the season the yield is not as heavy with the birds that have not had the light. The advisability of using light, therefore, will depend upon what is wanted. If early winter and high priced eating eggs are the object the lights are an advantage; if eggs during the hatching season are desired the lights are a disadvantage.

THE ROTARY GIFT

Her name was Minerva Dowd. She live in a nice little new house that she had built just to suit her. It had a fireplace and hardwood doors and bronze handles on all the doors. Miss Dowd had the money and she wanted the best for herself. She had been planning for her house for years and when she got it she saw that it suited her exactly.

She lived alone, because she preferred it. Yet there was room in the house for six people. However, company was exepnsive, and Miss Dowd never spent a penny which was not strictly for her own comfort.

Just across the street from Miss Dowd lived her only brother's widow and daughter. They had three upstairs rooms, too hot in summer and too cold in winter, but as good as they culd afford. Their most valuable possession was a sewing machine, which whirred day and night. Mrs. Temple and Elsie sewed for their living. Not being expert seamstresses, they had to take any work that offered and were seldom well paid for it. Mrs. Temple was a delicate ailing woman and Elsie was a delicate young girl. There was no reason in the world why Miss Dowd did not take them into her house. They were her only kin. But she never noticed them unless she was obliged to.

It was Mrs. Kellog who came to Minerva Dowd and told her that Elsie was going to be married. Minerva said nothing. She went steadily on with her crotcheting. She was always crotcheting something out of cotton or wool. She did not give these articles away and there was never any of them in sight.

"She is going to marry Fred Bailey," went on Mrs. Kellogg.

"You don't mean it!" Minerava looked up suddenly. What's she doing that for? Why didn't she get some one that could take care of her?"

"Land knows," sighed Mrs. Kellogg, who had buried two husbands and was looking for a third. "Love will go where 'tis sent, I suppose. Fred's a nice boy and Elsie's a nice girl. I heard that Mis' Temple was going to live with them and keep right on with her sewing. She's making Elsie's wedding dress now. It's going to be handsome, I tell you. It's white satin and some of that new crepe—Henryette or whatever they call it, I know it begins with a man's name. Well! Georgette then," as Minerva corrected her. They're going to be married in the church and have invited guests. Mis' Strong, who has the rest of the house, told me, so I guess it comes pretty straight. You'll be invited, Minerva, and you'll have to get her something pretty nice for a wedding present, won't you?"

Minerva closed her lips tightly. "I'm not saying what L'll do," she replied grimly.

She did not go to Elsie's wedding although she was asked. But she sent her a crotcheted bag—an ugly green and red thing which seemed designed for no special use.

"There," she said to herself maliciously, "the thread in that will pay for the most of printing that cheap invitation. And it will show those fool women just what I think of white satin dresses and church weddings when they haven't a dollar to their names."

Elsie and Fred opened Minerva's gift together and when they took out the green and red bag they laughed themselves into tears.

"It's a joke," Fred said, dangling the thing on his finger.

"I don't believe it was intended for one, but we'll treat it as though it were," Elsie replied.

Mrs. Temple was the one who was really disappointed. She had hoped that her sister-in-law would send Elsie something nice, since she could just as well as not. She kept the bag out of sight and finally gave it to Mrs. Griggs, who came in to help her clean up after Elsie went away on her brief wedding trip. Mrs. Griggs took it cheerfully, but at home she said to her daughter Grace: "Do you want that thing for anything, Gracie?"

"No, I don't," snappeed Grace, who was 14 and beginning to have ideas of her own. "It makes me billious just to look at it. I'll tell you, mother, we'll keep it till Christmas and give it to old Mrs. Bodine. We've got to give her something and this is bright, and it'll do just as well as anyhing."

So he bag went into a bureau drawer until Christmas, when old Mrs. Bodine got it.

"Now what in the world's Jane Griggs sending me a thing like that for?" Mrs. Bodine asked herself. "If she ain't getting stingy in her old age! I'll tell her as much. I'm real provoked at her, I am so. After I sent her that jar of marmalade, too! I don't want this contraption. I guess I'll give it to Mary Dix on her birthday. She'll eexpeect a little something from me and mebby this will answer."

So Mary Dix got the bag on that dreary day which marked her way of life like an ugly black milestone. For life had beene difficult for Mary. When sre looked at the bag she smiled faintly. "I supose eshe intended more than she accomplished. But I simply can't have this ugly bag where I must look at it. My room is so cluttered now that there isn't space for another thing. I'll give it to my landlady's maid. Maybe she can find uss for it."

So poor little down-at-the-heel Hetty Potter got it and thanked Mary for it very sweetly. But she didn't want it either, though she only earned $2 a week besides her board. "I can guess why folks make such things to give away," she sighed. "Let me seet! I'll givee it to somebody for next Christmas. I'll give it to Fany Moorehouse."

Fanny Moorehouse worked in the knitting mill and when she got the green and red bag she laughed merrily. "Poor little Hetty!" she said to her mother. "She thought she was doing something, didn't she? Well, I won't lay it up against her. I'll give her something worth while for her Christmas present and maybe it'll teach her not to do anything so foolish again. As for the bag, you can have it, ma."

"Good land, I don't want it!" cried Mrs. Moorehouse. "What'd I use it for, I'd like et oknow? Say, I'll tell you, Fanny. I'll give it to old Mrs. Kellogg. She's such a fancy old bird now that she's sprucing up so looking for a third husband that may be it will just please her. I'll risk it, anyway."

Mrs. Kellogg accepted the green and red bag without suspicion of its origin. "It's pretty," she said. "I do love bright colors. But—you see, Mrs. Mooreehouse, Mr. Huffy is dreffal set against them. You know I suppose that —we're going to be married? Oh, yes, we are. The day's set and everything. You're the first person I've told, Mis' Moorehouse. I haven't even told Miss Dowd yet. She's acted sort of miffed toward me lately and I ain't seen anything of her. Mr. Huffy is a strong Free Methodist, you know, Mis' Moorehouse, and he eain't got no use for flying feathers and floating ribbons. I knew when I said I'd take him I'd have to give all them things up. In fact, he left me to take my choice, and, of course, I chose him. It ain't pleasant to be a widow Mis' Moorehouse, especially after you've had two companions. I've got so used to seeing a man at the table that food chokes me when I sit down to eat alone. Mr. Huffy ain't what I'd picked out if I had my way, but he's a nice man, with considerable property, and there's nothing like property when you're making your choice of a life partner. That's what I told Elsie Temple when she married Fred. Not that she did so poor after all."

"I should say not," cried Mrs. Moorehouse. "Why, Fred's earning twelve hundred a year now. It's good, healthy business being a mail carrier, too. Elsie's the happiest thing with her new baby I ever saw—unless it's her ma. They don't ask any odds of Minerva Dowd. I'll tell you that.

"Well," said Mrs. Kellogg, "Minerva is just as God made her, I suppose. I hear she's sort of ailing lately from rheumatism. I ain't got nothing against Minerva, only I said she's acted miffy lately- Likely that'll all pass off soon as I go in to see her. I guess I will go in this very afternoon and tell her about Mr. Huffy. I'm real curious to hear what she has to say."

So that afternoon Mrs. Kellog went in to see Minerva Dowd. Her hands were swollen from rheumatism, and for once were idle.

"I've come to tell you some news and bring you a present, Minerva," said Mrs. Kellogg, and she dropped into Minerva's lap the green and red bag.

Minerva looked at it and the color flooded her face. She recognized it as a mother will recognize her long lost child. "My sakes! How'd you come by that?" she demanded.

"Why, Mrs. Moorehouse gave it to me," answered Mrs. Kellogg limply. "And as I am going to marry Mr. Huffy, and he's a strong Free Methodist and I had no further use for it, I———"

"And how did Libby Moorehouse come by it?" demanded Minerva, ignoring all else.

"Land knows," sighed Mrs. Kellogg.

Minerva held it out at arm's length. "I made this bag myself," she said, "almost two years ago for Elsie Temple when she was married. And here it is come back to me. Talk about your boomerangs! That's a boomerang, Hannah Kellog!"

"Is that what you gave little Elsie for a wedding present,"—it was Mrs. Kellog's turn to demand now—"after I pleaded with you to give her something real nice and useful? I'm ashamed of you, Minerva Dowd, that I ma. Of all the stingy, mean, dirty little tricks——"

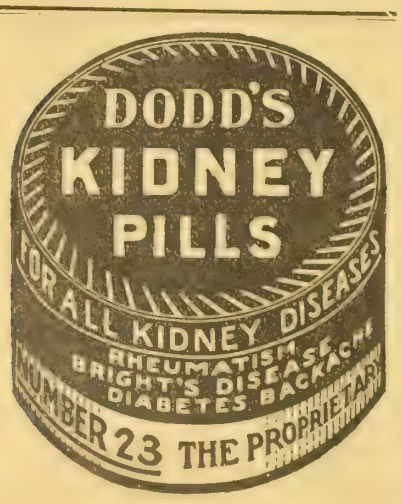
"Oh, I know it was," Minerva replied grimly. "I did it to be mean. And now I've got my meanness back just the way I sent it. I wonder if it isn't always that way with the meean things we do—that we get them back again when we've most forgotten them. My father used to say chickens come home to roost. I believe they do."

"I'm ashamed of you, Minerva Dowd," repeateed Mrs. Kellogg.

Minerva was ashamed of herself. Two days latere she sent Elsie Bailey's baby a cheque for $500. As for the bag, she keeps it pinned beside her bureau where she can see it every day.

FIRST AID

I have often thought how much better it would be for us to be better prepared for sickness in the house than many of us are. In the city it is



NO more reason for wash-day bringing back-aches, headaches and other troubles. No more need to bend over a hot, steamy wash-tub. Let the Maxwell "Home" Washer supplant old-time methods in your home as it has in others all over Canada. Maybe you don't know how good a washing-machine really *can* be? Then it's time you looked thoroughly into this one. It actually does *better* than hand-work in *half* the time! Washes anything.

Maxwell

"Home" Washer

—is made in Canada, of best cypress, and is superior to any imported washer. High-speed, noiseless, easy-running—enlosed gears. Can be operated by hand or water-motor. See it at your dealer's to-day.

HER LITTLE GIRL

COUGHED UNTIL

SHE FAIRLY CHOKED.

Mrs. John Reinhardt, Ridgetown, Ont., writes:—"My little girl at the age of a year and a half old had an awful cough. She would cough until she would fairly choke, and I was afraid it would go to her lungs. I thought I would use Dr. Wood's Norway Pine Syrup, as I knew of quite a few persons who had used it with good results. I am glad I did so, as I only used one bottle. It is a sure cure for coughs and colds."

There is no reason why Dr. Wood's Norway Pine Syrup should not be recognized as the very best cough and cold remedy on the market to-day, combining as it does the lung healing virtues of the Norway pine tree, to which are added wild cherry bark, squills, and other soothing and healing pectoral remedies.

It has stood the test for the past 30 years and is becoming more generally used every year on account of its great merits in curing coughs, colds, bronchitis, croup, whooping cough, asthma, sore throat, and preventing pneumonia and in many cases consumption.

So great has been its success that there have been a great many imitations put on the market to take its place. See that none of these so-called "pine syrups" are handed out to you when you ask for "Dr. Wood's." The genuine and original is put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

usually easy to obtain in very short time expert advice, also trained help and the many things designed for the comfort of the invalid.

In the country when one lives five or six miles, perhaps ten, from a doctor and a drug store, it is certainly more difficult. The patient may suffer a great deal before it is thought serious enough to call in the doctor, and often the amateur nurse has to send in haste to her neighbors to borrow the things needed, and perhaps have to do without them, for the simple reason it has never occurred to her to make any special readiness for sickness in the house, when every one was hale and hearty.

I have heard it said that they did not have the money to spare on things that were not an immediate necessity, but I think it is a matter of lack of forethought. When we are in good health, we are prone to forget that someone of the family might take sick any time. It is very wise to be prepared in our home to give first aid. It may save a greeat deal of suffering, and, who knows, it may save the life of some one very dear to us. Of course our first aid as mothers and head of the household is to put out an effort to prevent sickness and disease by seeing that the family is housed, clothed and nourished with due regard to the laws of health. No doubt many diseases are to be prevented by proper care on the part of the community and individuals. But, when all is said, there is no woman that even with the best of care, can ensure the health of her family and those dependent o nher, and at some time in their lives, most women are called upon to nurse the sick.

In serious cases it is a great aid to have a bedroom on the ground floor; it saves the tired mother many steps, and it is not using up wastefull the strength she needs for their services.

The sick room should be furnished very simply, so that it will be easy to wash and disinfect, as a sick room with elaborate dressing means much unnecessary work and care. There are a number of things that it is well to have on hand—the usual household remedies for slight burns, cuts, coughs colds, etc. These should be kept carefully and distinctly labelled, as very often a great mistake is made, when some one is in haste and the bottle is not labelled properly.

But there are a great many things besides drugs which it is well to have in readiness for an emergency, such as a hot water bag with all the attachments, thermos battle, feeding cup, which is of gerat use when a patient cannot sit up, some water-proof sheeting, a package of absorbent cotton and some clean (old linen, new linen is of no use.)

In sudden illness or accident it is of great value to know just where to lay your hands on these things, for very often everyone is so excited that there is a great deal of delay in obtaining what is needful. I remember being at a place once where a man was in most agonizing pain. I wanted some fiannel to put hot turpentine stupes over the abdomen, and there was such delay in getting anything and my patient was suffering so, that the doctor joined the hunt. He finally found what answered the purpose, on the line in the back yard. I think a very good plan is to have a box or bureau drawer which will be used for no other purpose and put into it all the old linen and cotton and flannel. Cut the buttons and ragged parts off, and then they are ready for use when needed, and if there is an emergency, you are ready to meet it, if not for yourself, perhaps for a friend or neighbor. In this way you will be lending first aid to those in trouble. Mothers should prepare for possible times of sickness, by training their little ones in habits of prompt obedience, for pain and illness only make a spoiled child more refractory, and if it struggles and fights against every remedy, the danger of its life is certainly increased. These are a few of the first needs in sickness.

It is my belief that we have a great many first aids in housekeeping, such as that those who are old enough to hang up their own clothes should put all their belongings just where they will know where to find them without having a general hunt; also in the morning when rising, turn back their bedding to air, and, if they do not sleep with their window open, (which they certainly should do), let them raise the window; in this way they are not leaving all the little things to be done by the one who has to do the work.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

CONVULSIONS IN CHILDREN

(By Dr. J. H. Riskmiller)

Convulsionns usually come without warning and are of grave future import, if the cause is not treated radically. Childhood, up to the completion of the first dentition, is the period of life at which convulsions most frequently occur. Older children, who at a nearlier age have suffered from convulsions, are frequently attacked again at the commencement of an acute infectious disease. Children who inherit from their parents a peculiarly nervous temperament are more liable to convulsions than others. This is often seen in several members of the same family. Females are more frequently affected than males. Teething and worms are among the least probable causes of convulsions. Rickets are a freuqent cause.

Acute and chronic indigestion are among the most frequent causes of convulsionns both in infants and older children. In either there may be but one attack, or attacks may recur at intervals of a few months with a repetition of the cause. The various infectious diseases, where they occur in a child over two years of age, may be ushered in by a convulsion. This kind of convulsion is seldom fatal and it always gives reason for the conjecture that the disease following will be strongly developed and run its course with violent symptoms. Under these circumstances the younger the child the more serious the outcome.

It may be well to detail the usual symptoms so that one may distinguish convulsions from epilepsy and the severer types of Saint Vitus' dance. There is little doubt that some cases of epilepsy have their origin in attacks of convulsions, which in the beginning were the result simply of digestive derangement; by a constant repitition of the exciting cause the convulsive habit finally becomes established. This possibility is, therefore, to be borne in mind in all cases where children have had several convulsions. In some children the initial symptoms are extreme restlessness with slight twitchings of the muscles of the face, hands, feet or eyelids. The muscles of the face are attacked by the most

A NERVOUS WRECK

FROM HEART AND NERVES.

There are many people at the present time whose nerves are unstrung, heart affected, and general health impaired.

To such we offer Milburn's Heart and Nerve Pills as the best remedy that science has produced for such troubles. These pills have a wonderful effect on the nerve cells of the body, giving them new life and energy; they strengthen and regulate the heart and make the blood rich and nourishing.

Mr. Joseph Daly, Wolfe Island, Ont., writes:—"I have used Milburn's Heart and Nerve Pills. I was a regular nervous wreck from my heart and nerves. I saw your advertisement in the paper and decided to try your pills. I took five boxes of them, and now I am as steady as a clock.

People said I could not be cured, but I fooled them with Milburn's Heart and Nerve Pills."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

varying twitchings; sometimes a smile plays over the face and sometimes an expression of anger. The jaws perform various acts, such as chewing, snapping, etc., accompanied by gnashing of the teeth. Fluids poured into the mouth excite imperfect acts of swallowing and the greater part flows out again. By this time the convulsionns have involved almost all the muscles of the body. The muscles of the back are in a state of contraction and the neck and head are thrown back. The extremities perform the acts of striking, thrusting or twisting. After a few whistling inspirations the breathing is suddenly suspended, and death may ensue in a few minutes if the spasm does not subside. There may be bleeding from the mouth and nose due to injuries of the tongue or lips which frequently occur during the snapping or biting movements of the jaws. Toward the end of the attack perspiration usually breaks out. The sensibility of the skin is so completely abolished that the child cannot be roused to consciousness by any means. One attack of convulsions is apt to be followed by others, for the occurrence of the first one usually reveals a peculiar susceptibility of the nervous system and each succeeding attack comes from a less powerful cause than the previous one. The longer the interval which has passed, the less likely is there to be a repitition, especially if the child has passed its third year.

The Treatment

In convulsions depending upon some disorder of the stomach or bowels the child is frequently troubled with constipation or it may be improperly fed. Convulsions are so frequently due to digestive derangements that the condition of these organs should be one of the first things to be looked into.

In the attack itself the physician seldom can render any material aid, for the reason that by the time he reaches the house the convulsions have almost invariably passed off, and his services are confined to imparting instructions for preventing a recurrence. The first thing to be done is always to undress the child as quickly as possible so that no constricting bands or skirts impede the respiration and circulation. Next the child, with the head slightly elevated, is laid upon a large bed when the convulsions are so violent that there is danger to the extremities against the sides of the bed or of its falling off. Cold should be applied to the head by means of an ice cap or cold cloths and dry hot cloths applied to the surface of the body and extremities. The feet be placed in mustard water while the child lies on the bed. The body may be placed in a mustard pack. The mustard pack and the foot bath should be continued unti lthe skin is well reddened. Frequently it is well to place the entire body in a hot bath of one hundred and five degress fahrenheit allowing only the head to remain out of the water. I have nothing to say regarding drugs, as the particular ones for convulsions are of a poisonous nature and should only be given under the personal direction of a physician. Secondary attacks are to be prevented by careful feeding, by improving the general nutrition, by means of fresh air and proper bathing, and by giving a general tonic, such as extract of malt with iron, quinine and strychnine.

MANAGING THE CHILD WHO TELLS FALSEHOODS

This fault of the child is one of the most trying that the mother has to contend with; perhaps because it is least understood by her, and is therefore more of a problem. She spends, perhaps, more anxious hours over this subject in the endeavor to find a means whereby the fault may be either checked or eradicated than over any development the child may show, and arrives at the same conclusion each time: "punish him and cure him."

But this method of dealing with the trouble is hardly just to the poor little offender. Faults are, after all, very like diseases; they must be treated from the cause and not the result, and to apply external lotions for an internal trouble is not the way to get rid of it. Lying is a fault that is to be deplored, not despaired over by the conscientious mtoher, for it is capable of being cured by a slow, patient treatment of sympathy, watchfulness and judicious kindness. It may startle mothers to be told that the watchfulness should begin with themselves, for they are constantly undoing the work they are trying to make a success by acting, speaking and living untruths before their children day after day.

In our associations with the greater things of life we forget that the life of a child is made up chiefly of little things that we would brush aside unnoticed. They are, n fact, the atoms thrown off from the greater bodies of our interests as they revolve about the experiences that make up all that seems worth while to us in duties, pleasures and ambitions. The child is taught variableness in truth by such seeming trifles as the following: "Mother will be right back and get the string for you in a second;" but mother is gone for an hour perhaps, and forgets the string. If the child has not wanted the string badly, he also has forgotten it; if he has wanted it, his impatience and reproach are manifested in the tearful: "But you said you would come right back and get it, and you didn't."

No, she didn't and the child has learned something of the elasticity of his mother's promises through this means. Perhaps she didn't even intend to "come right back" even while she made the promise; she said it to pacify the unconscious child who had trusted her. This, however, is not a noble thought, and, happily, there are mothers who deal honestly with their little children in the most trifling matters.

If young life is the bit of clay given into our hands to be molded by our touch into the perfection of its destiny, how can we fail to realize that every motion of a finger upon it is to make an impression for increasing its beauty or the reverse? Keeping faith with the child in the trifles—that, remember, are to him the great things of his life—is the slow, atomic method of building up the temple of truth in his mind.

Three definite causes induce lying in children—fear, imagination and undeveloped faculty. The first clearly indicates a lack of confidence between parent and child, for which the parent alone is responsible. Had the little one been trained to seek mother under all conditions, whether in pleasure, or pain, or misbehavior, fear of her under any of these conditions would not be possible. There is nothing a child craves more than sympathy, and we mean by that, sympathy that is hearty, honest, sincere, not the kind that says hurriedly to the one seeking it: "Yes, yes, I see; it's very nice, but run away now, like a good child, for mother's very busy."

The untruthfulness of an imaginative child is the most difficult to deal with because more intricate. In nine cases out of ten the child has not lied and has not had such an intention in his mind. Most children see things only as they are presented to their view in shape, size and dimensions, and can be relied upon to state facts with unswerving exactness. But occasionally we come upon a child who sees not only all of this, but the subject as it might be enlarged and embellished. He has, in fact, a wider if not a broader view, and makes state-

nents compatible with this suggestion, which to his horrified parent looks like a deliberate attempt to distort the truth. If we take lying to mean an intention to deceive, we must ge just to the child and see whether his has been his motive when making he statement.

Most children with this characteristic have a faulty memory, and should e held strictly accountable for facts, nd the difference between these facts nd what they would like to think to e pointed out to them, that they an see where truth ends and fancy egins. But to punish him is not to ure him, for after the punishment is ver he will still possess the lively magination and the ability to use it. magination in itself is a divine gift, nd should never be thwarted by ignorance. Guided into its rightful hannels by a wise, intelligent, comprehending mind, it cannot fail to be valuable adjunct to the higher development of the child as man or woman.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me to-day. Address:

Mrs. M. Summers, Box 309 Windsor, Ont.

A MESSAGE TO WOMEN!!

The child of slow moral nature can be quickened by teaching him the difference between courage and cowardice. Help him to understand that he is fighting the Giant Lie, that every time he deceives or tells an untruth he is the captive of the Giant, but when he boldly confesses his wrongdoing he has escaped from the prison of the Giant. This will arouse his interest in making an effort to conquer his weakness, and will aid in developing his imaginative faculty of which he probably has but little. Above all things, avoid correcting the fault of a child through the cultivation of its fear.

RURAL POSSIBILITIES

Were it possible for all those who claim the farm as their home to write large in their minds the thought of what can be done to induce the farm folks to live up to their opportunities there would be fewer young people discontented with rural life. There is not a place on earth where it is more possible to live up to the highest plane than on the farm. The farmer is absolute monarch of his time and his expenditures, and if he can but be brought to realize how true this is, he will be in a position to see his high opportunities, and make the most of them.

Higher living keeps the most productive and efficient workers on the farm, makes them contented and helps them to a great efficiency and productiveness. A cow which is well fed, warm and contented, gives a greater quantity of milk, other things being equal, than the cow, which is constantly half-hungry, always reaching for a wisp of something, or smelling the air for water and shelter. The folks of the farm, the ones who count most to the welfare of the farms, must be kept quiet and contented, well-fed, if you please, from a spiritual viewpoint, so that they can do their utmost in the way of production.

One of the serious problems of the farm is the keeping of the best youngsters on the farm, and making contented the women who have the homes in charge. If these have in reasonable measure the things they crave, they will not want to break away from the independence of the farm for the shut-in dependence of the city.

What, then, are the things which these important elements desire, to keep them at peace on the farms. Two things, principally: conveniences in the home for the busy mother, and social advantages for both mother and children. Are they worth it? It will cost very little in actual money, not as much as ones spend now for improved machinery on the farm, but the things which that money will buy are priceless for they include the highest of love and respect of those who should be dearest in the world to the father.

The home conveniences which women need, and which mean so much to them, cost less than the intricate machinery which is used on the farm outside, but yet are in such form that they can be transported from home to home.

Instead of being used for a few days or weeks each year, and then left to rust in desuetude, they will be used many times every day, and every time they are used, they will remind the wife and children of father's forethought concerning them. Water in the house, good lights, heat that really heats without making a litter all over he best rugs, bath tubs, a sink for the kitchen, none of these are prohibitive in cost, and all are in such shape that they can be moved, for even the water in the kitchen can be provided by a portable pump with a curved pipe, and a little digging any time will attach it to the house well.

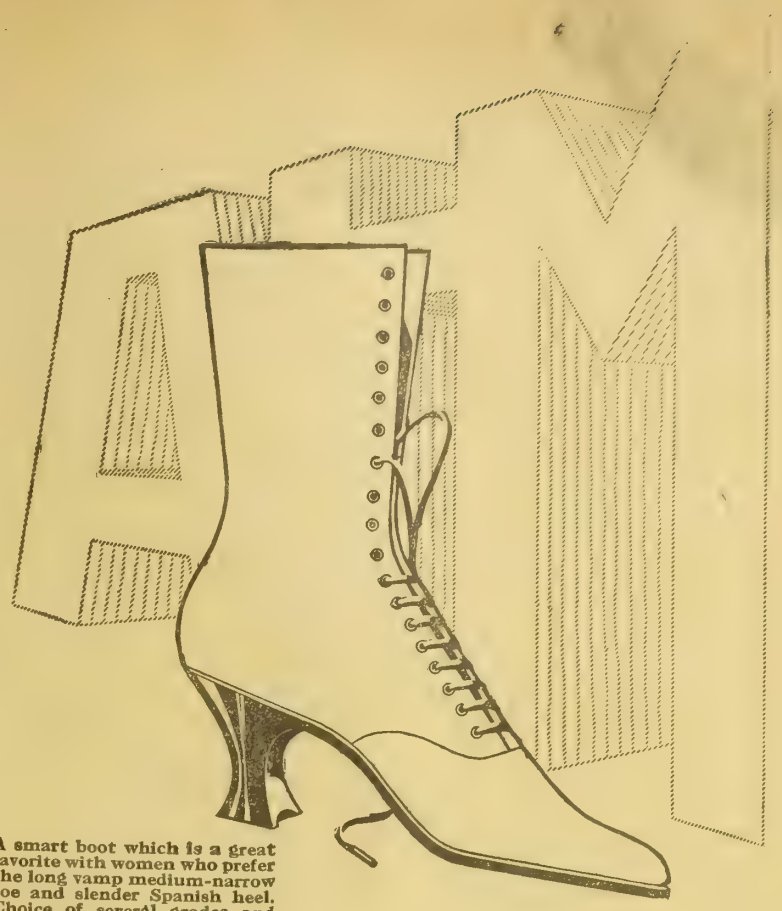
The social advantages craved by the dwellers on the farm are usually simple and can easily be provided for. Is the neighborhood musical? A weekly or fortnightly meeting of the community for concert singing, interspersed by special numbers from those better prepared, will be a source of perpetual joy.

To give this social circle a start, the mother or father should begin by inviting friends to the home for an evening of simple pleasure, and at the close ask them if it is worth while to make a regular thing out of such meetings. No formal organization is needed, although the work will go better wtih it. All that is needed is initiative and application.

The farm does not need to be uplifted, for it is already at the top of the world. All that it needs is to be shown that it is living below its possibilities, and taught how to live up to those possibilites. The farmer and farmer's wife wants a community spirit, working for the best for all in the community, and should their own theories stand in the way, they should be the first to push them from their pedestal.

KEEPING THE OIL STOVE IN GOOD SHAPE

As long as the burners of a flat wick oil stove are in working condition, even if when lighted there is a thin vapor-like smoke—not from the wick but from the metal chimney—



A smart boot which is a great favorite with women who prefer the long vamp medium-narrow toe and slender Spanish heel. Choice of several grades and varieties of leather.

How to Buy Shoes

THERE are many things which you need not buy unless you choose. But footwear is not one of them. You must have shoes. And the problem of buying shoes is one which comes home to every man and every woman in Canada.

In order to help you solve this problem, we have prepared a booklet with the title given above. We believe that you will find it helpful and interesting, whether you buy A.H.M. Shoes or not. And it is not necessary to buy A.H.M. Shoes in order to profit by the information which is contained in it.

We are glad to send a copy with our compliments to any address in Canada. Please send your request to our Head Office, at Montreal.

with an objectionable odor, such a stove can be made odorless and again give good service by boiling the chimney section in lye made by tying a quart of clean wood ashes in a cloth, in a crock, and covering with boiling soft water. Let stand over night, then in a deep kettle boil the chimney part, turning it about from time to time, that the hot lye may reach every particle of oil-permeated dusty smudge which has been beyond the reach and strength of ordinary cleaning with warm water and soap.

When it is not possible to separate the chimney section from the burners and the base, the whole stove must be subjected to the boiling process, after removing the oil and the wicks—an easy matter, as the one or the two flat-wick oil stoves are small, with a top frame-work nearly as large as the base, and such stoves can be turned upside down. And, then, the burners and the base of oil stoves always need a thoroughly good cleaning once a year, although the odor is located in the chimney section. After thus cleaning a stove it must be thoroughly rinsed and dried in a warm (not hot) oven or above the top of a stove. Too great dry heat is not safe for metal joints and fixtures. The present writer, after placing a tin ricer in a hot oven (for a safe length of time?) found it unsoldered and useless.

New isingless is always desirable, but not a pressing necessity. The tops of tin cans are flexible and can be cut and fitted over the openings in the metal chimneys of oil stoves—if not entirely, at least across the top and the lower section, with a little isinglass between. Before adjusting new wicks, always trim the raw edge with sharp shears and round the corners, then insert the wick at the top and turn downward, and trim the upper edge and take a little clip from the corners. Baste four or five inches of knit goods on the lower end of the wick, and thus be able to use every inch of your new wick; and never have wick material that does not touch the bottom of the stove base, and thereby be assured of a continuous fire until the last drop of oil has been absorbed by the regular wick.

The only way to keep an oil stove free from an odor is to keep it clean from day to day, and while it is lighted, by gripping a wad of soft, wet cloth with the points of an old pair of shears and removing smoke smudges as soon as observed. To keep an oil stove filled, and never allow it to burn out, is to conserve both wick and your oil stove—your new, or your old one made new by the lye cleaning process.

ECONOMIES IN COOKING MEATS

It is impossible to make a chuck steak taste like the porterhouse, or a slice of rump like a sirloin, but both these pieces of cheap meats may be broiled or stewed to make satisfactory meals.

The cheaper parts of the beef are found n the rump, from which one may secure moderately-priced roasts, braising and tsewing pieces, and what are known as hip or flat-bone steaks. The hind shin contains the best marrow, and supplies cheap stews and soup pieces. The chuck ribs may be converted into small steaks and stews, and from the neck pieces one may get splendid Hamburg steaks, pieces for stewing and mincemeat for pies. The rattleran is the cheapest part of the brisket and is only fit for corning, and then is only cheap for the family who likes fat.

It is not so much the low-priced meats as the wise selection and preparation of the meats that marks the thrfty housekeeper, and this wisdom can only be gained by experience.

Where the coal stove is part of the kitchen furnishing, the cheaper cuts are economcal.i These cuts are tougher than the loins and other sections of the animal, as they contain more muscle.

Slow cooking means that the water is kept simmering and never boiling. The meat should be farily cooked to shreds or the meat will be tough. The cheaper steaks should be pounded thoroughly to break the fibres; then broiled over a clear bed of coals. If liked best panned they will be found palatable if the fryer is smoking hot before the meat is laid in.

The liver of beef is much cheaper than that of veal or lamb, as are also the kidneys. Beef tongue has risen so high in price, since the demand has been created for it, that this portion of beef cannot come under the head of cheap meats.

The cheaper portions of veal are found in the breast, which may be used for stews, and when stuffed for rolled roasts. The ribs, shoulder and neck pieces are also used for stews. The knuckle, which is that portion left from the leg after the cutlets have been cut, is used in connection with the beef bone for delicious soup or for a potpie.

The cheaper portions of mutton—lamb is never cheap in the majority of sections—comes from the shoulder, which may be braised, steamed and boiled. The scrag end of the neck provides stews and broth. The leg is the only part of the cheaper portion fit for roasting, and it is more often substituted for "spring lamb" by first boiling until tender, then browning in a hot oven. For a large family a leg of mutton will be more economical than any other part, as it may be either roasted or boiled and served with a rich sauce flavored with either mint, capers or sour pickles. For the second meal, it may be eaten cold, and appear in a stew the third time. It may also furnish sufficient stock for a vegetable broth. The scraggy ends can also be worked up into croquettes or hash. The meat need not be used on consecutive days, but may rest a day or two in cold weather.

A porton of beel little known among housekeepers is the upper part of the shank. This is a heavy lean piece with one round bone, and is that portion of the leg joining the round. It makes a splendid stewing piece and is delicious when corned, while it is far better for soups than the bony, gristly piece known as the shin, as after the juices have been extracted for the soup the meat may be sliced cold, hashed or made into pressed meats. A little of the soup stock should be added to replace the nutriment drawn out in the slow cooking necessary for the soup. In stewing this porton a piece of fat should be added, as it is exceedingly lean.

When one gets chop hungry do not buy the loin rather than a rib portion, which gives more bone than meat. Trim off the surplus fat, shape the loin into rounds and secure with small wooden skewers; then broil. A delicious piece of meat will result, with scarcely any waste. But chops of any description cannot be placed in the economical list of meats, because of the demand for this portion.

The meats that may be converted into made dishes are the most economical, but they require care in preparation to make them fit to eat. So simple a dish as hash is often spoiled by the introduction of large pieces of gristle and fat, which are not necessary to a tasty dish of this kind. A little fat introduced into such a dish gives it flavor, but it should be chopped as small as the lean meat.

POTATO ROLLS (3 DOZEN

3 cupfuls of mashed potatoes.
4½ cupfuls of flour.
3 teaspoonfuls of salt.
2 tablespoonfuls of corn sirup.
1 cake of compressed yeast softened in ¼ cupful of water.
¾ cupful of milk, scalded.
2 tablespoonfuls of butter.

Add the hot milk to the potato and, when the mixture has cooled until it is luke-warm, add the softened yeast and other ingredients. Allow the dough to rise to double its bulk. Work it down, and let it rise until it has increased in size by about one-half. Then shape the rolls, let them rise until they are double in size, and bake them in a hot oven.

When using a recipe which must be referred to often, copy it and fasten to the wrist with an elastic band. If it is a recipe clipped from a magazine or paper do the same, and it is very easily consulted without wasting time walking across the room or searching for it.

Weak Emaciated, Nervous and Pale

MRS. FRANK BERRY SAYS SHE FOUND A CURE IN DODD'S KIDNEY PILLS

New Brunswick Woman Tells How She Got Quick Relief From Ills That Sprung From Sick Kidneys.

New Jersey, Northumberland Co., N. B., March 16th. (Special.)—Mrs. Frank Berry, a well-known resident of this place, is just one more added to the host of New Brunswick women who are singing the praises of Dodd's Kidney Pills.

"Dodd's Kidney Pills have cured me," Mrs. Berry says. "I was weak, emaciated and nervous. I would start in my sleep, and had bad dreams and nightmare. I was unable to do my work, my eyes were dull and heavy, and I was troubled with biliousness, headaches and constipation. My hands and feet were always cold, my skin was dry and harsh, and my face was marked with pimples.

"I was always tired and weak, and I knew I had bad kidneys. I took just three boxes of Dodd's Kidney Pills, and they have done me a world of good. They have cured me."

Mrs. Berry went right to the root of her troubles and treated her kidneys by using Dodd's Kidney Pills. She got results. If you have any of Mrs. Berry's symptoms, and have not tried Dodd's Kidney Pills, ask your neighbors about them.

GRACIOUSNESS IN SPEECH AND MANNER

There are, among young people especially, a number who do the right thing, but do it in the wrong way; who will perform a kind action, yet in such a manner as to give pain instead of pleasure—will grant a request or confer a favor in a manner so ungracious that the recipient almost wishes the request or favor withheld. Such a one is often unaware of her own ungraciousness; she knows she has done a kindness and blames the recipient for not showing more pleasure and experssing more gratitude. If she were told that the fault lay with herself, or rather with her manner, she would no doubt be very much astonished and probably reply that it was her natural manner. There are faults natural to almost every individual, that ought to be, and can be, overcome, and natural defects that require to be softened and improved. Of course training has a great deal to do with good manners, but even training cannot always supply the lack of graciousness, for this springs from kindness of heart and a desire to give pleasure to others. It is a great drawback for a woman to lack graciousness than it for a man, as far as society is concerned, for it is in the daily little matters of social life that it is most felt and the most missed. Has not everyone noticed the difference there is in a house presided over by a gracious mistress and the one wherein that pleasant quality is lacking? It is not, however, only in her own house and in her place as hostess that lack of graciousness in speech and manner is a drawback to a woman. Wherever her lot may be cast, and among whatsoever people, whether she is placed in a subordinate position or well at the head of affairs, at the beginning of life's journey or well on the uproad road, it is the same. If she lacks this gift she has missed a useful friend and a powerful benefactor. Without it she certainly may get on but with it she is almost sure to do so, and at the same time will gain friends and win affection, the latter so rich a gift to every woman, for without it none is ever really content or quite happy.

LAUNDERING THAT PREVENTS THE "FLU"

Every housewife will agree with me that the laundering of handkerchiefs is one of the most repulsive parts of the washing.

At this time when the "flu" is so distressing, I thought my way of laundistressing, I thought my way of laundering them might be of some value to others. Having used this method for ten years, I find it very satisfactory.

Put the handkerchiefs into a laundry pail; cover with cold water; add two tablespoonfuls of some good washing powder, also cut in a few pieces of soap. Place pail on gas or stove. Boil for 20 minutes, stirring quite often. After boiling handkerchiefs set pail under cold water faucet and rinse thoroughly, then blue and they are ready to dry. By this method you do not touch with your hands until they are ready to blue. But the greatest of all is the infected handkerchiefs do not come in contact with the rest of the laundry.

RICE COOKED THE CHINESE WAY

Wash one cupful of rice thoroughly and place it in a kettle which can be closely covered. Add one teaspoonful of salt and two cupfuls of cold water, cover, and cook for ten minutes after the water begins to boil. Set the dish where it will have heat enough to cook, but not sufficient to keep the liquid boiling. In twenty minutes the rice will be soft and dry, and each kernel will be quite distinct.

Candy not a Luxury

IT would be folly indeed if a belief detrimental to the public welfare—and proven false—was allowed to last any longer. That false belief is that candy is a luxury.

Candy is food in one of its most useful and attractive forms.

All elements used in the composition of Candy are recognized useful foods.

Candy contains large quantities of sugar, some fats such as butter; also nuts, fruits, corn syrup, chocolate and flavoring.

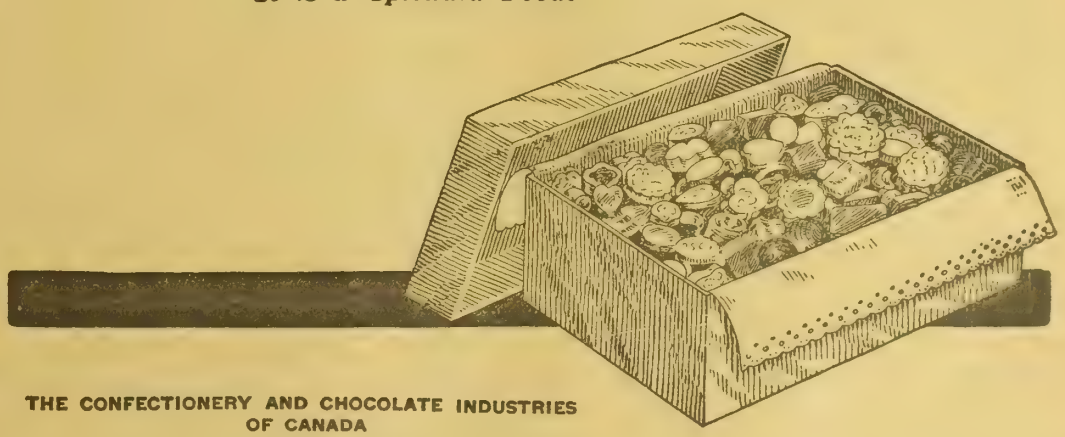
Combine these ingredients in proper proportions and you have a balanced ration—the high food value of which is recognized by all leading food and medical authorities.

Sugar supplies the bodily demand for fuel. Fruits and nuts produce essential nutriment; chocolate is a most nourishing fat food and delightful stimulant. The flavorings stimulate the digestive organs and increase the flow of saliva and gastric fluid.

Eat more candy!

Medical science has established its value as an energy-producing food.

Serve Candy as a Dessert.
It is a Splendid Food.



THE CONFECTIONERY AND CHOCOLATE INDUSTRIES OF CANADA

11

THE NOVA SCOTIA FARMERS' ASSOCIATION

(Continued from page 661)

year. Total membership 10,833, a gain of 425. Receipts for year, $23,904.81, a gain of $2900.

Eleven County Exhibitions held during the year. Richmond County called off and Inverness Exhibition a failure, both the result of prevailing epidemic raging at the time.

Mr. Fuller reported that in spite of all obstacles, County Exhibitions were improving and the prospects were good. Mr. Fuller expressed an earnest desire that the first prize winners at the County Exhibitions should in some way be made to show at Provincial Exhibition for educational purposes, the only way to raise the standard of the Exhibitor.

Mr. O'Brien spoke of the great need of taking up the question of lower rates for transporting these cattle to exhibitions with the Transportation Company.

Mr. Fuller then giving the Report of County Associations, said that although perhaps not so many meetings were held, there was still strong interest and things were progressing favorably. He referred to the Resolution passed at the last session that the Government be asked to increase their grant to Agricultural Societies from $15,000 to $20,000, an increase of $5,000.

This Resolutoin was sent to the Government and shelved. The need for this grant is greater this year than last and the only way to do is to go after it and keep at it, write letters to your local members for this increase and see to it that it is put through.

Mr. Fuller then read the Scrub Sire Act (another Act which did not pass last year) reading it for the purpose of seeing if Associations wished it again to go through. Also the Act regarding line fences, which was defeated last year. Both Acts were strongly favored by the delegation, many whom have suffered through not having Legislation on these Acts.

Mr. Fuller's report was received and accepted, and it was moved and seconded that a committee be appointed to carry out in detail the spirit of the report. Said Committee appointed by the Chair being Mr. Banks, Kings; Mr. Corning, Yarmouth; Mr. Moffatt, Cape Breton.

The report of delegates followed.

The Degelation was invited to a Tractor Demonstration at the Provincial Farm at 4 o'clock.

Meeting adjourned.

Thursday, 2 p. m.

Resolution re Daylight Saving System brought in by Committee. Mr. Ells spoke on resolution urging that just so long as these resolutions are not pushed by the farmers, just so long will these resolutions be shelved. If the local members of the different communities understand they will not receive the support of the farmer at election, then and then only will the farmers' interests be secured. Resolution received and adopted.

Mr. Fuller then addressed the meeting on "Marketing Facilities for Agricultural Products" showing the crying need for better facilities of this kind, the Stock Breeders case in the Maritime Provinces being almost hopeless, unless something is done and done soon.

He protested strongly against the proposed cold storage plant in Montreal. Montreal's port is closed for some months of the year, the preference should certainly be given to Halifax. He urged that an effort be made by the Nova Scotia Farmers' Association to compel the Government to spend the purposed million dollars for the same purpose in the Maritime Provinces. The Maritime Breeders' Association had already taken action in this line, sending a strong delegation to Ottawa some weeks ago to interview the different ministers. They were well received and the request given due consideration.

Mr. Logan, commenting on the address said Montreal does not need this cold storage. There is ample cold storage there now. Parties interested, with perhaps a good pull, were pushing this as it meant money in their pockets and will do so if they can get away with it. If a cold storage is started here we have the verbal promise that an Abbatoir will be started, which would eventually lead to a central stock yard for the Maritime Provinces. A number of members spoke strongly on the subject. With the Premier and Leader of the Opposition both from Nova Scotia, surely they should look to the interests of their own Province, if not, then throw politics to the winds and put in some one that will. The farmers have suffered too long in mind and pocket over this matter of better marketing facilities.

The cold storage plant in Halifax would be a great impetus to the Live Stock Industry.

A committee was appointed to draw up a strong resolution dealing with this most important matter.

Several resolutions of minor importance were then passed.

A resolution to increase the allowance for delegates expenses to Association was then discussed. but was not put through, owing to the Secretary declaring that financial conditions did not permit of it at the present time.

Mr. Ells spoke on the purposed increase in transportation charges to be made by the Express Companies, an average increase of 78% throughout Canada, special commodity rates especially to be attacked, which was going to hit the farmer hard, and purposed a representative be sent to the meeting, which is to be held in the near future in Moncton by the Express Company and Railway Commission, to show facts and figures why this should not be. The Fruit Growers' Association had already taken action along this line. This met with the approval of the meeting, and Mr. W. A. McKay of Truro was appointed as delegate to that conference, with power to appoint a substitute should he be unable to attend.

Resolution re Scrub Sire nuisance brought in by Rev. Father McPherson, the quality of live stock being low in some sections, one of the causes being the scrub sire a constant menace to the pure bred breeders.

A committee to draw up a law to control this and present it to the Government, was appointed. Resolution moved and adopted.

Mr. Cutten then gave an address on "Standardizing Farm Machinery". A progressive idea started first as a war measure. Everything to day is standardized, why not our farm machinery? No reason why the idea should not be developed, the present system is poor, causing much loss of time in consequence. Standardize all wearable and breakable parts, eliminate a great number of types of farm machinery and have only a few standard makes, whose parts are interchangeable. The farmer would be able to

"The Best Investment I Ever Made"

When a farmer recommends our fence to his neighbor, it means much more than anything we can say about it.

We therefore ask you, before you buy another roll of fencing, to inquire what other farmers have found out about

INVINCIBLE FENCING

If it happens that no farmer in your neighborhood has had Invincible Fencing on his farm a sufficient length of time to be regarded as a real test, write us and we will tell you of farms on which it has stood the test of many years' real service.

The experience of one farmer with regard to Invincible Fencing will be exactly like that of every farmer who has tried it—because every bit of fence that leaves our factory is tested so rigidly that we are able to assure you it will all measure up to the same high standard. Unlike most wire fence manufacturers, we are able to guarantee, not only the weaving of our fence, but also the quality of the steel from which the wire is made—for Invincible Fencing is made entirely by ourselves, from ore to finished product.

We fully guarantee the material in Invincible Fencing to be of the best, heavily galvanized open-hearth steel. Then, on top of that, we guarantee its workmanship—equal strands, straight stays, solid and secure locks—these are the features of Invincible Fencing that ensure its holding under the most severe strains.

When to these features of Quality, you add the important fact that Invincible Fencing is made in Canada by Canadian workmen, you must see that it is to your interest to insist on this Brand, in the purchase of which you keep your money in circulation in your own country. Our advice is backed up by the advice of the better dealers—for in almost every locality it is the leading merchant who sells our Fencing. Catalogue will be sent you on request.

THE STEEL COMPANY OF CANADA, LIMITED,
MONTREAL

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. Furrow opens and seed drops in plain sight—an equal distance apart at uniform depth, with absolutely no injury to seed. Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and low draft.

Write for free catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. In Stock Near You. A success for over 20 years. Whether you are a large or small grower—write today.

Send for Catalog

EUREKA MOWER CO., Box 745 Utica, N.Y.

FROST & WOOD CO., LTD - - - - - ST. JOHN, N. B.

get repair parts easier and at less cost. Standardizing pays as proved by the standardizing of Wool.

This Standardization of Machinery has already been taken up in the Western Provinces.

A Resolution was passed urging the Government to undertake this step. Mr. Cutten's address will appear in a future issue.

Resolution re Soldier's Land Settlement Act was then brought in. Rev. Father McDonald as mover of this resolution, said that after hearing Lieut. Robertson's address of the previous evening, he had given this matter due consideration, and felt the Act might not fully benefit the soldier as hoped for. Does the soldier realize what he is up against? Is the soldier getting the best deal possible in starting him out with such a debt on his hands? Machinery is at the highest now and it seemed a poor time for the soldier to jump into this thing as many might do without due consideration.

After a general discussion in which many viewpoints on this subject were put forth, the resolution passed as read.

Meeting adjourned.

Thursday, 7.30 p. m.

Meeting opened with President in the chair.

Resolution brought in re the Deer Menace to the farmer

Mr. Bacon of Digby spoke on the resolution telling of the destruction to the crops by the deer in Digby county. It was a very serious menace in some sections.

Resolutions adopted and left with the Legislative Committee.

Resolution re compelling first prize animals to compete at Provincial Exhibitions was next brought in and discussed. Prof. Trueman spoke in high commendation of the educational value which would be derived by the passing of this resolution. The county exhibitor can learn much by measuring up his stock against that shown in the larger exhibitions.

Resolution adopted.

Another Resolution was that embodying a plea for larger representation in Parliament, and for farmers to elect their own members in counties where farming was the chief industry.

Mr. Fuller spoke briefly on the resolution which was carried unanimously.

Prof. Trueman then addressed the meeting on "Feeding Problems." He said that there was more rapid improvement in Live Stock Breeding in Nova Scotia than n Live Stock Feeding.

Some farmers complain that the stock they receive does not measure up to that which they have seen at the Agriculture Farm, and he went on to show that all the offspring cannot be expected to measure up to the ancestry of the bull.

Another reason for failure of heifers to produce what is desired, is because they are not fed properly from the time they are born. The younger you begin to feed the better results, the growth force and the vitality is in youth. If you don't feed the young animal you can't regain it. Put the frame work and size into the animal the first year.

Farmers complain they cannot afford to feed their cattle as they do on the Government Farms. When we get down to realizing that we are a live stock country and put forth our efforts to feed our land, produce more per acre as they do in Europe, we will be able to feed our cattle better.

Prof. Trueman emphasized the value of barn yard manure. A great deal of it is wasted in this country; it should be conserved, it would save much in the way of buying fertilizer. The time to get it out is odd days in winter, if the labor problem is what is holding you back. He also spoke on the value of silage for feeding, as proved by the College. Feed the cattle and feed the land wherever you have a sod—it will pay you to feed it with slag or ashes. 400 lbs. slag used per acre in the fall at N.S.A.C. The cattle cannot gain on poor pasturage. With more attention to our summer pastures our live stock would be materially improved. Follow up the good breeding by good feeding.

After a brief discussion, brought out by this interesting address, Dr. Sinclair spoke on the horse, using as his text, "Shows and Judges of the Shows."

He spoke of the trivial points in relation to judging, how the manners of a horse had a great deal to do with the judging. Teach a colt to stand and walk properly—few horses know how—especially the draught horse. Show taste in fitting them for the show and show your own animal.

Shows are for educational not show purposes, the one man judge was personally favored by Dr. Sinclair. An expert in every class rather than the popular citizen judge. A judge should have the privilege to tell why he makes his decision, an expert can do so. Neglect of the feet is a common defect in animals. Attend to these defects early.

A judge should be able to withhold a prize if none are worthy. Why should an inferior animal get a prize because it is the only one of its class. A judge should educate; why discourage the very object you are working for and mislead the onlooker. Tell him why he does not get a prize, probably next time he will come back with a better animal. There is no getting rid of unsound animals by the method now employed. After this interesting address the report of the Legislative Committee by Mr. Wm. O'Brien was received.

(Continued on page 668)

This Engine Has Proved Its Value

—it has demonstrated itself as an indispensable part of the equipment of the up-to-date farm. It has proved that its low first cost, its more-than-rated-power record, its economy of upkeep, its simplicity and its low fuel cost make it the logical farm engine.

The 6, 3 or 1½ H. P. "Z" Engine

were designed and have been built to meet every requirement of the farmer. Over 200,000 have proved this to their satisfaction.

This is the engine you need on your farm—the engine that has been proved up, that will save you money, worry and labor.

The "Z" Engine burns either coal oil, (kerosene) or gasoline.

Investigate this engine today. Ask your nearest dealer; he is the man who stands behind this engine as a direct representative of the manufacturer. He is always at your service to see that you are satisfied.

HINTS FOR MOTORISTS

by ALBERT L. CLOUGH

Editor Motor Service Bureau Review of Reviews...

Copyright, 1919, by The International Syndicate.

Questons of general interest to motorists will be answered in this column, space permitting. Address Albert L. Clough, care Maritime Farmer, Sussex, N.B.

KNOCKING DUE TO TOO HIGH COMPRESSION

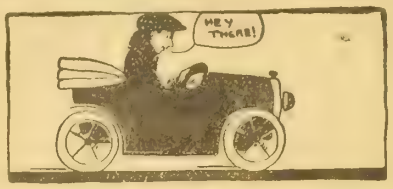
Maximum Allowable Compression Depends Upon The Fuel

There are a great many instances of engines—not of the latest models, but still built within the last four or five years—that now give trouble by knocking, especially when they have been continuously operated, very heavily loaded, for some time. Such engines may be in perfect mechanical condition and free from carbon, the mixture may be correct and the ignition perfectly timed and still they are prone to knock, under trying conditions. This fault makes the operation of such engines unsatisfactory and its probable cause is obscure to many motorists who are troubled by it. The sound that is properly called a "knock" is generally caused by premature ignition, which produces a downward or reverse pressure upon the piston, while it is still moving upward on compression and heating the fresh charge. The "near kerosene" fuel, now being used will not withstand, without exploding, the same elevation of temperature that the real gasoline formerly used would stand and, when the cylinders are very hot, it ignites prematurely at the high compression attained in engines of older design, and knocking and loss of power results. The remedy for knocking in engines, which have too high compression to burn present-day gasoline successfully, is to increase the clearance space above their pistons and thus reduce the compression ratio. This can be accomplished in two days. The cylinders can be raised slightly from the crank case, so that the pistons do not travel quite so far toward the cylinder heads. A metal gaset or liner, placed between the cylinder flange and the crank case surface, will accomplish this and no other adjustment is usually required than the lengthening of the valve push-rods. Most manufacturers, whose engines need them, can furnish such cylinder gaskets, which are usually from one-eighth to one-quarter inch in thickness. The other remedy is the use of low compression valve caps. Ordinary valve caps close the clearance space about flush with the interior surface of the head, but these special valve caps are hollowed out to form chambers and thus add to the clearance space and diminish the compression. Such valve caps are obtainable from manufacturers, whose engines have developed preignition troubles of this kind, or they can be made specially. Naturally this preignition tendency, due to the change in fuel, is most often found in engines which were designed on high compression lines, but those having defective water jacket provisions or weak circulation are also subject to it. Many an old engine which now fails to "stand for" long, hard pulls, without knocking, can be made to do so by lowering its compression.

FORD CAR "CREEPS" WHEN IN NEUTRAL

K. T. writes: With the pedal and hand lever both in neutral position and the engine running, my Ford moves slowly forward. Please explain how this action can be stopped?

Answer: Probably the clutch lever screw, which bears upon the clutch cam, requires an extra turn to make

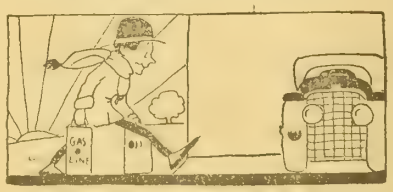


up for wear and to cause the clutch to be held in neutral. It may also be that the lever brakes need a little taking up as, if they were in good adjustment, the car could hardly move, even though the clutch did drag. Be sure that the low speed is not unnecessarily tight. If you are using a grade of oil, which becomes extremely thick when cold, it will cause the clutch to drag, even though its plates come out of actual metallic contact. In Ford transmissions, which have seen extensive service, the clutch plate driving lugs, upon the inside of the transmission case, sometimes wear out of fit with the slots in the discs, with the results that the discs tend to wedge and do not release as they should.

LIMBERING UP COLD ENGINE

D. W. P. writes: After my car has stood in my unheated garage for several days, I sometimes find that it is almost impossible to turn the engine over. Is there anything I can do to loosen it up, upo nsuch occasions?

Answer: You might try this procedure: Remove the spark-plugs and



inject quite a little gasolnie on top of each piston, which should loosen up their oil films. Follow this up with an injection of light machine oil in each cylinder, which will not thicken at the temperature of the engine. If most of the resistance is in the pistons you ought then to be able to turn the engine over but, if the main bearings are very stiff, cranking may still be difficult. With an engine fitted with crank case hand holes, the removal of which exposes the main bearings, these can be loosened up by squirting them with machine oil.

PREIGNITION FROM UNSUITABLE SPARK-PLUGS

The Engine Builder Usually Recommends The Best Adapted Type of Plug

A not uncommon cause of knocking from preignition of the charges is the use of spark-plugs ill adapted to the particular engine. Some plugs are made with very long shells, which are required in certain engines to bring the spark points properly into the combustion space. However, when such plugs are used in other engines, the shell may protrude so far into the combustion space that it becomes hot enough to fire the charges prematurely, under continuous, full throttle operation. Some plugs have thin porcelain cores of the petticoat type, designed to give a soot-proof effect. These cores do not always cool effectively and the porcelain may become hot enough to cause premature firing or to cause missing by failure of its insulating properties when heated. Other plugs are made with quite massive spark points of considerable length and it sometimes happens that the heat retained by these, under high speed open throttle conditions, is sufficient to raise them to a preigniting temperature. These troubles, naturally, are met with especially in engines which are running close to the safe limit as to compression pressure. While it is by no means necessary for a motorist to stick to the same make of spark-plug that is supplied with his engine, it is generally a safe practice to adhere to the use of plugs of the same general type and proportions. Nearly every large manufacturer of plugs makes a number of types, one of which will be found to conform closely to that found best by the manufacturers of each particular engine.

DANGER FROM TIRES BLOWING OFF

A. L. G. asks: Is there any danger that a tire may blow off the rim and hurt someone, while air is being put into it?

Answer: There have been a few bad accidents and numerous narrow escapes caused by the outer ring blowing off the rim during inflation, the ring being projected with very dangerous force. Such an accident is caused

CANADIAN EXPLOSIVES TRADE CXL MARK LIMITED

Stumping

—means bigger farm profits

It is the modern way to farm—the way to develop the new farm or improve the old. C. X. L. Stumping Powder is your means of speeding up labor and of increasing acreage or crops.

C. X. L. will clear away stumps and boulders, drain or irrigate your land, and is an invaluable aid to the fruit grower. C. X. L. Stumping Powder will do the work of a man, two horses and a stump puller in removing stumps, and do it twice as fast at less cost. It will ditch bog land in half the time it can be done any other way.

C. X. L. will make the holes and break up the hard pan for tree planting—insuring earlier maturing, healthier trees than those that are spade-planted.

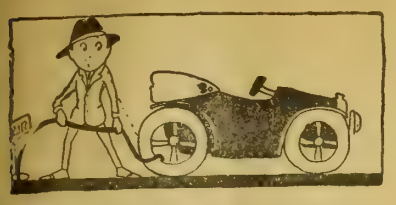
y the failure of the locking device to hold the outer rim securely and can be avoided by seeing that the ring is securely in place and the locking device acting properly before air is put in.

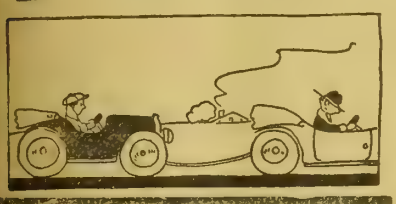


After very slight inflation, the locking arrangement can again be inspected to make sure that it is going to hold. Standing out of the way of the ring, should it blow off, is always a safe precaution.

STIFF ENGINE RESISTS CRANKING

J. R. writes: After taking up on the main bearings of my engine, I find that I cannot crank it. I am almost certain that none of the bearings are dangerously tight, as I took great care in the adjustment. I can exert enough force to spring the starting crank, but the engine does not budge. How can I turn it over?

Answer: By hitching your car behind another and allowing the latter

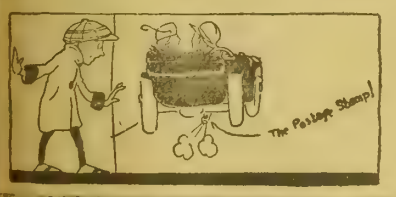


to tow it, putting your car into high gear and then gradually letting in your clutch, your engine can probably be turned over, but this must be done cautiously or your engine bearings may suffer. If you jack up one rear wheel of your car, throw in the low gear and clutch and turn the free rear wheel in the forward direction, by hand, you will exert great cranking power on the engine and start it, unless the bearings are altogether too tight for safety.

PREVENTING UNAUTHORIZED USE OF CAR

C. B. L. writes: I have a very strong suspicion that my car, which I keep in a public garage, has several times been used by someone, without my knowledge or consent, but I have no absolute proof of this. Is there any way I can get a check upon this sort of thing?

Answer: The most natural thing to do is privately to read the odometer and the gasoline gauge every time the car is left and screw on the gasoline filler cap to a secret mark. If any change is noted upon your return, the car has presumably been used. You can write your initials on a postage



stamp and stick it upon some inconspicuous part of the exhaust pipe when it is cold. If the stamp has been removed or is found charred, it is a pretty sure sign that the car has been upon the road. It is possible to leave the brake set and the lever sealed with a private seal, but if this is found broken, the excuse probably will be made that the car had to be moved to make room for others. The unauthorized use of cars has sometimes been discovered by the owners finding the engine warm, when he has not used it for days.

Unity–Stability–Prosperity

are the aims of the

Canadian Reconstruction Association

Industrial Stability
is essential to
Agricultural Prosperity

Farm and factory are linked in a national economic chain. Without the agricultural West there would be diminished markets for manufactured products, unemployment, and national depression. Without the industrial East prices for farm produce would decline, agriculture could not flourish, and "hard-times" would follow. During the war, agriculture and industry have prospered. During the reconstruction period, it is imperative that there should be no rash change in economic policy. Tariff uncertainty is already retarding the readaption of industry to peace conditions. Any revolutionary change in fiscal policy will produce industrial depression. With industrial depression, there will be diminished markets for agricultural produce, low prices for foodstuffs, and hard times for the farmer.

The Canadian Reconstruction Association urges
A NATIONAL POLICY IN THE NATIONAL INTEREST

THE NOVA SCOTIA FARMERS' ASSOCIATION

(Continued from page 685)

Friday 9 a. m.

Meeting opened with President in the chair. Report of credentials Committee received and accepted, after which the following officers were elected for the ensuing year:

President, D. R. Nicholson, Coxheath.

Vice-President, J. Howe Cox, Cambridge Sta.

2nd Vice-President, Johnson Cameron, Stellarton.

Directors: W. A. Bacon, Digby; Rev. R. L. McDonald, P. P., St Peters; A. N. Griffin, New Minas; A. G. McKay, Stellarton; Capt. Hugh Dickson, Onslow.

Exhibition Commissioners: H. S. Kennedy, Stellarton; Wm. O'Brien, Windsor Forks.

Auditors: J. P. Landry, J. M. Trueman.

Resolution re exhibition buildings, Halifax, read and accepted.

Report of committee in regard to the purposed cold storage plant.

Mr. Griffin speaking to the resolution said he considered it one of the best if not the best ever put before the Association. It should be boosted.

Mr. Corning then spoke on resolution, emphasizing the benefit to the consumer as well as to the producer. All should join hands to get the erection of this plant.

After several others had endorsed this resolution which found favor with all, it was received and accepted.

Resolution re inspection of wool passed.

J. D. McKenna, Manager of the Maritime Farmer, Sussex, N. B., then addressed the meeting on Co-operation. Mr. McKenna is thoroughly conversant with his subject and brought it before his audience in a very clear and concise manner. He spoke of the antagonism met with when the Maritime Farmer took up co-operative buying for the farmer, but things have progressed along this line until $150,000 worth of feeds alone were brought in to the farmers of New Brunswick this year at cost price. Mr. McKenna said it was no wish of his to advocate any particular line of co-operation. He did not wish to interfere in any way but to those who would care to take up this project that is so benefiting the farmers of New Brunswick he would be glad indeed to render any assistance along that line if they would just write him to that effect.

The benefits that would accrue in uniting the buying capacity of Nova Scotia, New Brunswick and Prince Edward Island could not be overestimated. Mr. McKenna cited the great benefits in the West derived from co-operative buying. Consider the asset of combined buying; the farmers should capitalize this asset for themselves and thereby save. Buy in car lots, pay cash and save huundreds of thousands of dollars in the Maritime Provinces. Orders amounting to $350,000 had passed through the Maritime Farmer to the Agriucltural Societies in the past year. He explained fully the workings of this co-operative buying through the Agricultural Societies. Through the Agricultural Societies the farmers also gets satisfactory banking accommodation.

In the Province of New Brunswick and through the pages of the Maritime Farmer, Banks now appeal to the farmer to come for credit, knowing this safe channel in lending to the farmer. The Banks being thus anxious to do busines with the farmer makes buying now easier. Make up your estimates for the year, buying unmixed goocs. Your society takes the orders, sends them to your Secretary-Treasurer, and he makes the Banking arrangements. New Brunswick has found this an excellent system. Mr. McKenna stated that next year they would be prepared to supply fertilizer to Nova Scotia at the same price as in New Brunswick.

In New Brunswick in the past year good seed, not fancy, but good, was purchased in this way. Some trouble has been had with regard to feed, the retailer making things rather unpleasant. Ground special at $34.90 a ton gave very satisfactory results in the County of Kings, very little bran and sorts being sold. Feed prices, Mr. McKenna stated, have certainly been brought down through the medium of the Agricultural Societies being in the business. In concluding Mr. McKenna said that although co-operation is not all sunshine, we have learned in the last four years what co-operation really means. It meant everything to the British Empire and now we are facing the bigest co-operative movement of all, "The League of Nations." Everything is organizing now and the man who is last organized seems to be the farmer. "Too much politics, and too little farmer," as Premier Foster remarked during his address to the New Brunswick Farmers Association this past week. At Fredericton there is a labor representative there during the whole session. At Ottawa the manufacturers and labor union have a permanent man there looking out for their interests, but did you ever hear of a Lobbyist from the farmers at Ottawa or Halifax? Why not? My suggestion to the farmers of the Maritime Province would be to get together and organize effectively and get down to business and don't stop at the Lobby. Send your men right into Parliament to represent your interests. In the Maritime Provinces we have farmers with quite as many brains as some others sitting around Legislative bodies. The time is here when the farmers should assert themselves.

Mr. McKenna closed his remarks by renewing his offer of all possible assitance should they wish to organize for co-operatinve buying.

Prof. Cumming in commenting on the address said he approved in general of the idea. Ontario and the West have done this and what they have done we can do also.

Lieut. Robertson wished to ask if Nova Scotia had a representative in the Canadian Council of Agriculture. On being told that they had not Lieut. Robertson said he thought they should have one. This Council is supposed to represent the farmers of Canada and if the Provinces of the West have a voice in that body, why not Nova Scotia? If they have, as some think, too advanced ideas, it is up to the farmers of Nova Scotia to have a representative to bring forth their views. Mr. Ells said their platform was a non-partisan one and worthy of being studied.

Mr. O'Brien moved a hearty vote of thanks to Mr. McKenna for the highly instructive and interesting address which he had given. He heartily agreed with Mr. McKenna's views on co-operation. This was seconded by Mr. Frank Foster, who said he knew something of co-operation and had benefited by it. Motion was unanimously carried.

The Legislative Committee was then appointed for the ensuing year: R. J. Mesenger, Lawrencetown; S. A. Logan, Amherst.

Mr. Nicholson, the newly elected President, was then called to the chair. Mr. . Freeman in vacating spoke of the pleasant relations during his term of office with the farmers of Nova Scotia and congratulated the Association on the appointment of their President for the ensuing year.

Mr. Messenger called for three cheers for the retiring president which were given with a right good will, followed by the singing of "For he's a jolly good fellow."

Lieut. Robertson referred to the passing of the Resolution re the Soldiers Settlement Act, on the previous day, and wished to know if it was a criticism of the Settlement Board. Mr. Corning, as seconder of that resolution, the mover being absent, assured Lieut. Robertson that no criticism or reflection was intended on the pe

PAROID
A NEPONSET ROOF

THE economy of roofing with Paroid is apparent when you consider:—

It can be laid quickly, and at half the cost of new shingles.

When put on, Neponset Paroid forms the ideal roofing—fire, weather and wear-resisting.

Neponset Paroid Roofing lives long, stands up, and pays for itself yearly by giving absolute protection and satisfaction.

Neponset Paroid Roofs have proven their durability and economy for twenty years.

Neponset Paroid Roofing can be applied over old shingles without the added expense of tearing them off.

A full set of the tools required for laying Paroid is shown below.

Roof with Neponset Paroid—it Pays.

Neponset Paroid Roofing is made in three colors: red, green and slate grey.

Sold by Hardware and Lumber Dealers.

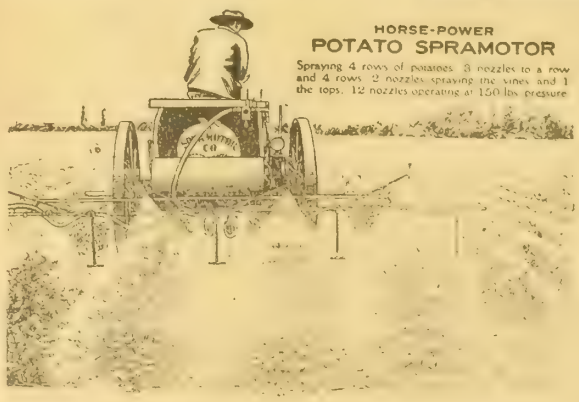
Getting Double and Triple the Crop with a Spramotor

It isn't a SPRAMOTOR unless we made it



HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes 3 nozzles to a row and 4 rows 2 nozzles spraying the vines and 1 the tops. 12 nozzles operating at 150 lbs pressure

TO GET twice and three times the yield from row crops, fruit trees and plants is the common experience with Spramotor users. We hesitate to mention the increases some farmers have secured—they are so great as almost to be incredible.

Buy a spray outfit—morover, buy a Spramotor; because it is the world's best, made right here in Canada, no duty to pay, has met and beaten the pick of all makes in Government contests and at the World's Fairs and Expositions. Every machine guaranteed.

FREE:—We have a valuable illustrated work on "Crop Diseases" to send you, postpaid, for the asking. Also catalogue showing our complete line of hand, horse, knapsack and power machines. Write to-day for your copy.

THE LONDON SPRAMOTOR, 6035 King Street, London, Canada

sonnel of the gentlemen on these boards. The idea was rather that the farmers felt the handicap too great, as presented by Mr. Robertson. Mr. Messenger said in interviewing different returned men, that he found that the intelligent soldier sees it differently than he did at first glance, and feels it is better to keep off.

Lieut. Robertson pointed out the fact that the Board has to consider the facts that a too easy proposition would mean a great rush of men, who perhaps had no particular aptitude for this line, and would throw up the sponge in a few years. He had neglected to state in his previous address that the Government has secured all erturned soldiers wholesale rates on purchases.

Mr. Bacon suggested that exemption from interest for a period of years would lessen the burden ocnsiderably. Lieut. Robertson considered this an excellent idea.

Prof. Cumming considered the general idea of Resolution passed was not far astray. Don't make the whole view of the farm proposition too rosy, give them the right idea. He was glad to know the general form of the resolution went through.

Prof. Trueman thought there was no need to worry if some were discouraged. As a member of the Qualification Board, he knew many had to be turned down.

The criticism of the Association he fully understood was of the Act, not of what is being done in Nova Scotia under the Act.

Mr. Corning felt that in justice to Lieut. Robertson, that a rider should be attached to former resolution, correcting any wrong impression made, and a committee was appointed to draw this up.

Mr. Burchill, Windsor, thought the Association could render invaluable help in guiding the choice of the soldier and looking out for his interests.

There being no further business the meeting adjourned to inspect the N. S. A. C., it's live stock and surroundings, a feature which the delegates found both pleasant and profitable.

Following are the resolutions passed during the session.

Resolved that this Nova Scotia Farmers' Association approves of any policy rendering practical assistance to the settlement of returned soldiers on the land.

We record our conviction, however, that the present Soldiers' Settlement Act while well intended, fails to the extent hoped for and may even result in injury to him.

We would strongly recommend that the soldier take no advantage of the Act as it stands at present, until such time as the price of building material, machinery, etc., becomes more nearly normal than such now are, and we recommend as a body that a sum not less than the value of the free grants of land given the veterans of the Boer war be first alowed each soldier land settler, either in cash or as a credit against any sums borrowed by him under the Soldiers Settlement Act.

And further resolved that copies of this resolution be sent to the Rt. Hon. Sir Robert L. Borden, to the Minister of the Soldiers Settlement Department and the Chairman of the Soldiers Settlement Board. Mover, R. L. McDonald, P.P.; seconder, H. W. Corn-

---

Whereas the Exhibition Buildings in Halifax were destroyed by the explosion and therefore it is impossible to hold an Exhibition this year, which is a great loss not only to the Live Stock Breeders but also to the farmers of the Province of Nova Scotia

Therefore resolved that the N. S. Farmers' Association urge the Halifax Exhibition Commission to make every effort to re-estalish the Exhibition in Halifax, by the erection of permanent buildings for that purpose. Mover, Wm. O'Brien; seconder, N. Caldwell.

Whereas deer were some years ago imported into this Province and for a long period killing of said deer was prohibited by Game Laws for the Province,

And whereas the said deer have increase in number until they have become quite plentiful,

And whereas the said deer have been a great menace to the farmers, frquently entering their crops of vegetables and grain and destroying them wholly or in part and they are also gurdling and browsing and destroying young orchards,

And whereas there is a fine, running from fifty to two hundred dollars, on the Statute Books of this Province for killing deer out of season.

Therefore be it resolved that this Nova Scotia Farmers' Association now in annual session respectfully petition the Government of this Province to pass legislation whereby the Farmers of the Province be fully and substantially protected against the great amount of destruction done their crops and young fruit trees by the said deer. Mover, W. A. Becon; seconder, H. S. Kennedy.

"Would you step on a cockroach---or would you refrain from staining the floor ?"—*Roosevelt*

THE "ethics" of business call for courtesy between competitors—and the "ethics" of advertising also demand "truth in advertising." After observing the former, we find it absolutely necessary to "step on" some of the false claims and untrue propaganda of several separator manufacturers in an attempt to preserve a semblance of "truth" in their advertising.

We owe it to the dairy people of this country to present the real facts regarding cream separators. Propaganda based on the falsest of claims has been spread in an attempt to mislead American farmers. In presenting these facts, we stand ready to prove every assertion; they are based on actual records of dairy history.

Official records show that the first cream separator was invented by the French, and that patent No. 105,716 was granted to the company of Fives-Lille, of France, November 19, 1874, for a "system of continuous centrifugal separation." A little later the Danes developed the cream separator and were the first to introduce cream separators into America. Four years later, in 1878, a Swedish concern took advantage of the French invention and built a cream separator.

Looking for American business, this concern contracted with Mr. P. M. Sharples, an inventive genius of West Chester, Pa., to manufacture, install, and repair their machines in America. The first machines were decidedly impractical and unfitted for efficient use in American dairies and creameries.

Mr. Sharples attempted for a few years to make of this foreign machine a satisfactory separator, and during this time invented all the great improvements that have since been used by this type of machine. Among his invented improvements were the discs in the bowl, the splash oiling system, the detached spindle, the lowering of the supply can, and the concave bottom bowl, which permitted a part of the weight of the bowl to be suspended below the bearing. The complication of the machine, however, soon caused him to give up this manufacturing contract entirely, and, with true American ingenuity, he built a real American separator, adapted to American dairy needs and entirely different in that it was a most simple and efficient machine.

The Sharples factories are the oldest and largest separator factories in America. They have always been entirely American-owned. During the thirty-eight years of its existence, The Sharpels Separator Company has manufactured more separators than any other factory in America, and the output of the Sharples factory today exceeds that of any other separator factory in the world. More Sharples machines are being sold than any other, and a much larger percentage of those sold are today in actual use.

Every American dairyman should know these facts, and has the right to, and should, on buying a machine, ask the following questions of any separator manufacturer:

"Will your separator skim clean and deliver a cream of even density at any speed at which it may be turned ? Is the bowl free from troublesome discs or blades ? Has the separator an entirely automatic oiling system and do you guarantee your separator for durability to the extent that you guarantee a repair expense not to exceed $2.00 per year ?

"Is your separator built in American factories, by American manufacturers, by American labor, of American material, and entirely owned by Americans ? Is it truly an American separator, encumbered by no suspicion of taint of Hun propaganda ?

It is due to Mr. Sharples' untiring efforts during the thirty-eight years of his separator manufacturing experience—not to any foreign makers or inventors—that the American farmer owes the modern efficient cream separator. The Sharples Suction-feed Separator is the perfected machine; all other separators are today where Sharples left off years ago—old style, bucket bowl, fixed feed machines.

We say, without fear of contradiction, that the modern Sharples Suction-feed Separator

—is the *only* separator in the world that skims clean and delivers a cream of even density at widely varying speeds;

—is the *only* separator in the world with a controlled varying capacity;

—is the *only* separator in the world with a knee-low supply can, easy to fill;

—is the *only* separator in the world with a perfect automatic splash oiling system, not a single oil cup;

—is the *only* separator in the world with a hollow tubular bowl—no discs to wash.

Write today for the complete Sharples catalog on cream separators.—Address Dept. 79.

"OVER 2,425,000 SHARPLES SEPARATORS IN DAILY USE"

CO-OPERATIVE BULL ASSOCIATIONS

(Continued from page 659)

"I am more interested, and I am going home to see what can be done to organize an association; but tell me, how do you arrange for the keep of the bulls?"

"That is arranged by the members of each block. They find one man who will take care of the bull and then agree to pay him a stipulated amount for furnishing all or part of what is necessary to properly care for the bull. The members of each individual block can arrange this to suit themselves with only this condition to observe, that the bulls are the property of the whole associaion and must be kept according to the requirements of the association. It is in the hands of all the directors to see that the bulls are properly kept and the director in each individual block is held responsible for the proper care of the bull in his block."

"We will have to figure that out for ourselves, I suppose. I have been waiting for you to say something about contagious abortion. Is it not going to spread this disease, having the bulls used in so many herds?"

"That is what so many think when they first hear of this plan; but in reality the bull association makes better conditions. The objection is in the same class with the objection that you undoubedly have heard put up against the use of ensilage, that feeding ensilage to the cows will rot their teeth and burn out their stomachs. Observations with bull associations show that there is less trouble, if anythng, with this disease in bull associations than outside of them. The members in a bull association are working together under the best regulations in their by-laws for avoiding this disease, and it is very apparent that the organized condition of the farmers helps to control not only abortion but also other infectious diseases."

"I feel that this information has shown me a way out of one of my farm problems, and I am glad I came. May we come back with some more questions about how to organize a bull association if we find that there is enough interest in our district to organize one?"

"To be sure, but you may find this information nearer home by going to your state agricultural college. Remember this, however, such an organization does not organize itself. It takes some time to gather up your material and perfect the association; it does not build itself. You may find that your neighbors do not take hold of this matter at once. Some may feel that such an organization may not be practical, but there are 1,000 men in the United States who have proved the bull association to be very practical and successful. They are found in 18 states, and are members of 44 associations, and each association has, on an average, five blocks; nd I hope that also you and your neighbors, Mr. Dewitt, will be the beneficiaries of such an association.

"The state or federal extension worers, or both, will give you assistance, if you ask for it; and here are several copies of a sample constitution and by-laws that may be useful in drawing up a constitution for your association. Call again."

DESIRABLE CHARACTERS IN GRAIN VARIETIES

(Experimental Farms Note.)

The desirable characters of any variety are those that enable it to thrive in the environment in which it is placed, or give it commercial popularity. The undesirable ones are those that prevent it from achieving its best whether on the farm or in the market. According to conditions a desirable character in one locality may be an undesirable one in another.

In any kind of grain, yield is, and always will be, a desirable character, but in many localities the variety must primarily depend on other characters, such as drought resistance, early maturity and tightness of chaff, to give it value. In localities where conditions are less severe, these again may be of actual harm, as a larger yield could be obtained with a variety that was later in maturing, having a loose chaff and being more adapted to a humid climate.

Earliness exceeds yield in importance in all of the northern districts of Canada, and wherever it is a question of maturing grain before the time of frost.

Tightness of chaff in wheat is necessary wherever high winds prevail at the time of ripening as on our prairies. In eastern Canada, however, where no loss is experienced from winds, and the threshers are not used to threshing tight chaffed wheat, considerable grain may be lost over the rear of the mill.

Varieties that have the ability to resist drought do not, as a rule, succeed where there is an abundance of moisture.

High baking strength is absolutely essential wherever wheat is grown for export, but for domestic use a variety may be grown to advantage that has only moderate baking strength, if it gives a high yield.

Thinness of hull in oats is a desirable character under all conditions. Hullessness in oats is only desirable for a few special purposes. The husk facilitates the commercial handling of the grain and protects the kernel from injury.

Beards on wheat and barley are most undesirable, but in the case of barley it has not as yet been possible to produce a beardless variety giving a yield that will equal the best of the bearded sorts.

Awns in oats are unnecessary and are not in any way connected with yield.

The colour of grain is most important, not that it has any intrinsic value, but because the market demands a certain colour of kernel in wheat, oats and barley. This demand has arisen from the association of a certain colour with an outstanding variety such as the red colour of the Red Fife and Marquis wheats, etc.

Enough has been said to show the fallacy of the idea that any variety of wheat or oats or barley is superior under all conditions, to all other varieties. The truth is that every variety has its limitations, and it is up to the grower to procure a variety which possesses the characters that will enable it to thrive under his conditions. If in doubt, consult the superintendent of your nearest Experimental Station, or write directly to the Dominion Cerealist, Central Experimental Farm, Ottawa, describing your climatic conditions and requesting his advice as to the variety that will succeed best in your locality.

DUST "SPRAY" FOR FRUIT TREES

While a number of Canadian orchards have been treated with a dry dust instead of a wet spray, the operation is not general practised or understood. In a recent issue of Rural New Yorker reference is made to the work done along this line by the editor. "Our use of the dust," he says, "is confined to one season's work. We used it in fighting the codling worm and scab and similar diseases. We made no scientific experiment or exact measurement or weighing, but it was evident to all that the dust was fully as effective in killing the worms as the liquid poisons. As for apple tree diseases, the dust held them in check, but not quite so effectively as the liquid. The experience was so satisfactory that we shall continue to use the dust for the worms. When it comse to fighting the scale, plant lice and some other pests we shall depend on the liquid. We think there is little sense in claiming that this dust will destroy the scale. From the very nature of that insect and its manner of protecting itself it is evident that some penetrating and slow-spreading liquid must be used to coat the entire tree. We shall continue to use soluble oil or lime-sulphur put on with the liquid sprayer to keep the scale in check. If you have scale in your orchard, or if you need to spray for plant lice, you cannot reasonably expect to keep the trees clean and uninjured by using dust alone. If your object merely is to kill the codling worms and keep ordinary tree diseases in check the dust alone will do it.

"The dust is more expensive than the liquid. The power machinery will cost nearly as much as a power sprayer. We can put the dust on almost three times as fast as the liquid can be wel laplied. That was our chief reason for using the dust. The orchard is on a hilside, with a long haul for water. We can run down into the orchard with a half day's supply of dust and stay there until the job is done. This is the chief argrument in favor of dusting. In all large orchards there are times when the weather and the wind conspire to delay spraying. The buds mature rapidly, and in order to do effective work the poison must go on at once. In such cases the dust is invaluable, for it can be used rapidly so that the poison is put just where it is needed. Thus the dust will not entirely displace the liquid. It will take care of the worms and save labor and time, but in any section where the scale is found some liquid spraying will be needed.

GROWING CLOVER FOR SOIL IMPROVEMENT

One of the most interesting experiences on record, which had for its purpose the determination of the value of clover as a soil-improving crop, is that reported by Frank Shutt of the Canadian Experimental Farms at Ottawa. In the spring of 1897 an area of land, divided into plots of one-twentieth of an acre each. was sown

O-K CANADIAN 2-ROW SPRAYER

partly to wheat, partly to barley and partly to oats. The osil was a sandy loam in a fair state of productivity. It had received an application of 15 tons of fresh manure in 1896 which had been followed by the growing of a crop of roots.

On May 5, 1897, the plots were sown to the grains above mentioned. One half of the number of plots devoted to each of the cereals was seeded to mammoth clover. The yields of crops in 1897 were as shown in the following table:

Yield Per Acre of Crops, 1987

Crop	Without Clover Bushels	With Clover Bushels	Gain for Clover Bushels
Wheat	19	16½	— 2½
Barley	36½	39½	X 3
Oats	61	57½	— 3½

The plots seeded to clover produced a rapid growth and had formed a heavy mat of foliage by October, at which time the area was plowed to a depth of 8 inches. On April 27, of the spring following, the plots were seeded to oats. The difference in the growth of grain was very noticeable and the resulting yields gave evidence of the effect of the clover.

Yield Per Acre of Oats, 1898.

Crop followed	Without Clover Bushels	With Clover Bushels	Gain for Clover Bushels
Wheat	37	56	19
Barley	37	44	7
Oats	44	55	10

In 1899 these plots were sown to barley. The effects of the clover were still evident both in the apparence of the crop and in the yield.

Yield Per Acre of Barley, 1899

Crop followed	Without Clover Bushels	With Clover Bushels	Gain for Clover Bushels
Wheat and Oats	25	40	15
Barley and Oats	28½	33	4½
Oats & oats	33½	44½	11

These increases in yield are considerable. Yet the experiences of many farmers would seem to indicate that they are not excptional. This does not necessarily mean that the effect was due entirely to the nitrogen secured from the air by the clover, but it does mean that ti was due to the clover having been grown.

Nitrogen organisms aid in increasing yields. The nitrogen collected by the nodule organsms and their associates, especially Azotobacter, must certainly be credited as being responsible for a part of the increased yield. That the nitrogen so fixed may be considerable is indicated by another experiment conducted on the Ottawa Experimental Farm to determine this point. A plot of ground was set aside for this purpose on which clover was grown for 10 consecutive years, each year's crop being cut and allowed to decay on the plot. The clover was reseeded every 2 years to insure a good stand. The soil, at the beginning of the experiment showed a nitrogen content of 533 pounds per acre to plow depth. At the end of 5 years the soil contained 841 pounds and after 10 years, 1,044 pounds of nitrogen per acre. This represents a gain of 51 pounds per acre each year in addition to that lost in the drainage water.

Where did the nitrogen come from? Some very important circumstantial evidence of the value of the clover crop is contained in the 35-year test which has been conducted at the Pennsylvania Experiment Station. In this test the rotation has been corn, oats, wheat and hay, the hay being a mixture of clover and timothy with clover predominating in favorable years with good treatment. In this experiment, by the use of what would correspond to 300 pounds of 16 per cent acid phosphate and 200 pounds of muriate of potash, the yield of crops has been maintained during the entire period at an average of 52 bushels of corn, 42 bushels of oats, 19 bushels of wheat and 2 tons of hay per acre.

A study of the yields by periods does not indicate that they are decreasing. The question arises, "Where did the nitrogen for these crops come from?" No manure was applied and all the crops were harvested and removed from the field. We can only say that apparently the nitrogen content of these soils has been maintained at the expense of the nitrogen in the air in which the clover nodule organisms played an important part.

Similar evidence is available at Wooster in the experimental work with fertilizers on the 5-year rotation of corn, oats, wheat, clover and timothy. The records on Plot 8, which has received 320 pounds of acid phosphate and 260 pounds of muriate of potash in every rotation during the 25-year period, covered by the test, indicate that the yields on this plot are being maintained. The nitrogen content of the crops removed in 25 years is estimated to be 1100 pounds per acre. It would appear that this amount of nitrogen, together with that lost in the drainage, must be accounted for largely, if not entirely, in the nitrogen-fixation process going on in the soil.

Canadian Ad. No. 1—131 lines x 6⅛ in.

No. 306 Hill or Drill Seeder, furrowing, planting, covering, rolling and marking next row in one operation.
HILL DROPPING DEVICE

Save Seed

Whenever practicable, *plant in hills*—save the seed that would otherwise be wasted in crops which are widely thinned

—avoid useless buying of high-priced seed, and conserve the world's supply by using the hill-dropping feature on the Iron Age Hill and Drill Seeder. This saves from a half to three-quarters of the seed used by drilling and very greatly reduces cost and the labor of thinning.

Last year we all gardened as a matter of patriotism. We learned what a fine thing it is to have *our own* fresh, succulent vegetables, and also that it pays! Now—the boys are coming home! New nations are in the making—new nations to be lead and fed! More urgent than ever is the need for

Otherwse, the yields would certainly be on the decline.

The value of clover as a protein feed alone should insure the growing of an extensive acreage of this legume on every farm in Maritime Canada. When, in addition, we consider its effect on the soil, both direct and because of the greater plant food content of the manure produced from feeding the clover crop, we are led to believe that clover should find a most prominent place among Maritime Province farms. If there is a failure to grow clover owing to the difficulty of getting a stand, try to locate the reason why.

When the soil fails to grow good crops of clover it is under suspicion. Drainage, limestone and a light application of barnyard manure or fertilizing chemicals are the remedies. A close observation of the conditions and the clover plant's answer to your questions will give you a clue as to which remedy you should apply.

MARKETS.

CHARLOTTETOWN

Beef market easy. Carcass 14c to 16c; ;retail 20c to 24c.

Straw, loose, 45c to 60c per 100 lbs. Pressed, $12.50 to $14.50 per ton.

THE LOCAL GRAIN MARKET

Montreal, March 15.—The feature of the grain trade today was the pronounced strength which prevailed in the option market for corn at Chicago and prices scored a further advance of 3 ⅞c to 5c per bushel, which makes a net gain so far this week of 8¼c to 9c. The market today was excited on the advance in prices for hogs, which forced shorts in corn to cover. The Winnipeg market was also stronger in sympathy with the above and oats closed ½c higher and barley ¼c. A much stronger feeling also developed in the domestic market for cash grain and prices for Canadian western oats were advanced 1c per bushel, Ontario grains 2c, and barley 1c to 2c. This strength was entirely due to the conditions of the above markets, as there was no improvement in the local or outside market to warrant any change in prices, and business generally was dull with car lots of No. 3 Canadian western barley quoted at $1.10, No. 4 C. W. at $1.04, extra No. 3 Ontario at $1.11, No. 3 at $1.10 and sample grades at $1.04, No. 2 Canadian western oats at 86c, No. 3 C. W. at 81c, extra No. 1 feed at 78c, No. 2 feed at 74c, Ontario No. 2 white at 76c and No. 3 white at 74c per bushel ex-store.

DAIRY PRODUCE TRADE

The receipts of butter today were 12 packages as compared with 37 for the same day last week, and 57 for the corresponding date a year ago. The feature of the trade today was an advance of 1c per lb. in prices for job-

FARMERS FRIEND FENCING
FROM FACTORY TO FARM
PLOW TO THE FENCE LINE
Because of the present high price of living and farming, every farm owner should utilize every available foot of ground to the best possible advantage. You cannot do this with the old rail fence. You are bound to have a lot of waste land in the fence corners, growing obnoxious weeds, infesting the whole farm and making an unnecessary expense and a waste that should be obviated. You are interested in making money—not wasting it. A farm to bring a return for the money invested and the labor expended must be farmed thoroughly —all of it farmed thoroughly. There must be no waste fence corners and no weeds to contaminate the land. A farm to be profitable must be clean.
When you plow to the fence line, as is shown in this illustration, you reach a maximum efficiency. A full hundred per cent fence satisfaction is realized. These are all important considerations. A good fence must be well made. Not only must the material—the wire that is used—be of the best, but the knot that ties the stays and lateral wires together must be of the best. Then you have a fence that stays where you put it. Same even tension winter or summer—strong—durable.
There is great satisfaction in constructing a good fence like the
SARNIA
Fence for these reasons. The strong line wires have a wave or crimp which gives elasticity and spring to the fence and also provides for expansion and contraction caused by heat and cold. Great care is given to a uniform tension on each wire, so that there will be no long wires to make the fence sag, nor any short wires to take up all the strain and break. The strain is evenly distributed on each wire. The Sarnia Knot fastens the stay wires to the line wires in such a manner that they cannot be slipped in any direction. At the same time permits easy erection over rough or uneven ground without kinking or bending either the lines or the upright wires.
We sell direct; prepay freight on all shipments in Old Ontario. New Ontario, Quebec and Maritime Provinces, 4 cents per rod extra. Our office at Winnipeg takes care of all Western Canada business, quoting F. O. B. Winnipeg, thus effecting a splendid saving in that part of the Dominion. Sarnia Fence is made in Canada for Canadian farmers. Sold direct on our "save-you-money" plan. Order now. Have your fencing on hand when you need it and at our exceedingly low prices. Send for descriptive literature, price list and order blank.

The Big Value Package that is Guaranteed.
Perfectly packed in bright lead foil, and price marked on every package.

bing lots, which was attributed to the recent strength in the wholesale market, and sales of finest Eastern Townships creamery were made at 54c per lb. in solid packages, and at 55c in 1 lb. blocks. There was a very firm feeling in the wholesale market with a stedy trade passing in finest New Zealand creamery at 55c per lb., finest Eastern Townships at 53½c, and finest western at 53c, while undergrades sold at 51½c to 52½c.

We quote wholesale jobbing prices as follows:

Finest creamery solids....00c to 54c
Finest creamery blocks...00c to 55c
Fine creamery, solids....52½c to 53c
Finest dairy .....45c to 46c
Fine dairy .....44c to 44½c

The receipts of cheese today were 20 boxes as against 84 for the same day last week, and 16 for the corresponding date a yera ago. There was nothing new to note in the market today business being quiet and prices unchanged.

THE FLOUR MARKET

Montreal, March 15.—The flour market was without any new feature to note, busines in all directions being quiet, and the prospects anything but encouraging for any improvement in the near future. The tone of the market remains steady and prices unchanged with car lots of Government standard spring wheat flour quoted at $11 per barrel in jute bags, ex-track, Montreal freights, and to city bakers at $11, ex-track, or at $11.10 delivered, while smaller quantities are selling to city bakers at $$11.10 ex-track, and to grocers and other dealers at $11.20 ex-track, all less 10c per barrel for spot cash. The condition of the market for winter wheat flour is unchanged with only a small trade passing at $10.20 to $10.30 per barrel in new cotton bags, and at $10 in second-hand jute bags, ex-store. The demand for white corn flour is dull at $8.50 to $8.70, and rye flour at $8.50 to $9 per barrel in bags, delivered to $8.50 to $8.70, and rye flour at $8.50 the trade.

MILLFEED AND ROLLED OATS

Montreal, March 15.—The condition of the market for millfeed was unchanged, the demand for all lines being still somewhat limited and business was slow for the season of the year. Car lots of bran were quoted at $40.25, and shorts at $42.25 per ton, including bags, ex-track, and small quantities of the former sold at $43.75, and of the latter at $45 to $46, pure grain moullie at $64, pure oat moullie at $60 to $62, pure barley feed at $52 to $54, mixed grain moullie at $47, and dairy feed at $43 per ton, including bags, delivered to the trade. There was no improvement in the demand for rolled oats and prices for broken lots of standard grades were steady at $3.90 to $4 per bag of 90 lbs., and Golden cornmeal sold at $4.50 to $4.75 per bag.

THE BALED HAY MARKET

Montreal, March 15.—A fair trade continues to be done in baled hay and the tone of the market is firm with supplies coming forward ample to meet all requirements, and sales of car lots of No. 1 timothy hay were made at $25, No. 1 light clover mixed hay at $24, No. 2 timothy hay at $24, No. 2 clover mixed hay at $23, and No. 3 timothy hay at $22 per ton, ex-track.

THE PROVISION MARKET

Montreal, March 15.—The feature of the live hog situation was the decided feeling which prevailed in the Toronto market yesterday, and prices scored an advance as compared with last Thursday of 75c to $1.15 per 100 lbs. which was attributed to the keener demand between packers for supplies owing to the prospects of further evxport orders for hog products, and sales were made at $19 per 100 lbs. weighed off cars, and at $18.75 fed and watered. The Winipeg market was firm and unchanged with sales of selected lots at $17.25 per 100 lbs. weighed off cars. The local market today was stronger in sympathy with the above and prices made a further advance of 25c per 100 lbs. under a good steady demand for all offerings, and selected lots sold at $18.50 to $18.75 per 100 lbs. weighed off cars. The market for dresed hogs was firm with a fair trade passing in a jobbing way in abattoir fresh-killed stock at $25 to $25.50 per 100 lbs.

There were no new developments in the condition of the market for smoked or cured meats, but the feeling is very firm, and the prospects are that that if prices for hogs advance much further there will be a readjustment of values for all the above lines in the near future. The demand continues steady for small lots for domestic account and fair trade was done in a jobbing way in 8 to 10 lb. hams at 35c per lb., 12 to 15 lbs. at 33c. to 34c., and heavier weights at 31c to 32c, while breakfast bacon sold at 40c, Windsor selected bacon at 42c to 43c and Windsor boneless bacon at 44c to 45c. The market for barreled pork was quiet but firm with sales of small lots of Canadian short-cut at $54, short-cut fat back pork at $52, mess pork at $45, and bean pork at $43 per barrel.

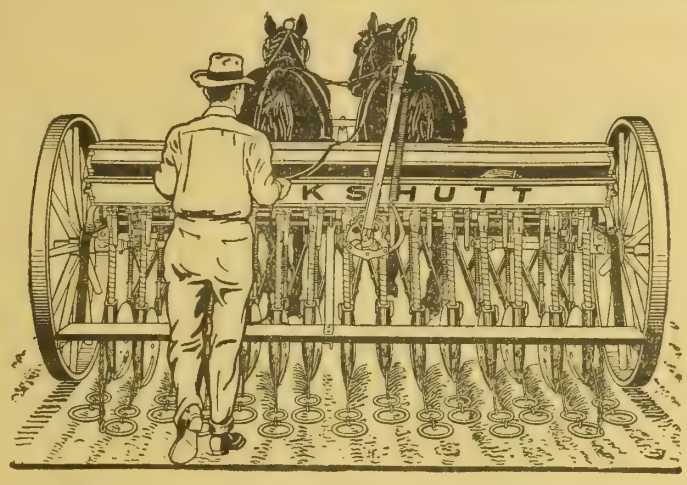
The tone of the market for lard was also firm with a fair trade passing in a jobbing way in Canadian pure leaf grades at 28c per lb. in 20 lb. wood pails, and at 29c to 29½c per lb. in 1 lb. blocks. hTe receipts today were 58 packages lard, and 234 tinned mets.

Pep is the thing which causes us to think clearly and act quickly.

COCKSHUTT SEED DRILLS

To buy good, vigorous seed—to faithfully put the land in good tilth and then fail to see that the most important operation, Seeding, is correctly done would seem to be inexcusable yet many a poor crop is traceable to that very thing. The Drill you use may be hopelessly out of repair and out of date. Better scrap it and go in for a Cockshutt and you get

Accurate, uniform, reliable Seeding absolutely assured



Here's a light draft Drill built with superior Canadian workmanship and materials and many years of practical field experience behind it.

It has the rugged strength that makes for hard, steady, repair-free servicee over a long life time. Its immensely strong I beam and frame mean absolute rigidness, with lightness. Wide, strong wheels with self-aligning axles, give splendid traction—no sliding on rolling ground. The feed is absolutely positive, harmless to seed, and can be quickly regulated to sow any desired quantity. Discs, in two seections, cultivate ground as well as giving an even channel for seed. Each disc is independent and will rise at an obstruction; when disc sections are raised feed is cut off.

The Cockshutt Drill doesn't need ideal soil conditions—it's built to do good work in any field, clean or trashy, wet or stone hard.

We have a special Drill Folder you ought to read. It's a very important subject. Write our nearest Branch for a copy today.

1279 SPECIAL TRAINS ON C. G. RAILWAYS

Up to March 1st 767,400 Troops Have Travelled Over Government Railways.

Thousands Arrive Each Week at Halifax and are Sent Forward to Dispersal Areas.

Since the war began in 1914 up to March 1st, when S. S. Belgic disembarked her returned soldier passengers at Halifax 767,000 troops have been carried on special trains over the Canadian Government Railways.

The first train which carried troops over the Government Railways the year the war was declared was numbered one and all special troop trains to and from Halifax since that time have been numbered consecutively. The last train from the "Belgic" on Saturday was No. 1279. Each train averages about twelve cars with an average of 50 men to a car, which figures up to a total of 767,400 men carried. Of course in addition to this thousands of soldiers have journeyed between Montreal and Halifax by regular trains during the past four years.

The movement of troops back to Canada is now approaching its greatest activity. Last Saturday nearly 6,000 arrived at Halifax by the transports "Lapland" and "Belgic" and fifteen special trains were dispatched westward inside of fourteen hours.

S. S. Megantic with soldiers and dependents arrived Wednesday and S. S. Adriatic is due Sunday. The movement of returning men is to be kept up actively all summer.

The process of disembarkation at Halifax is being carried on without a hitch and there is a fine system of co-operation between the Military and Railway officials.

87 YEARS OF PROGRESS

It is typical of the solid progress of the Maritime Provinces and of their sterling integrity in financial matters, that their most representative bank, the Bank of Nova Scotia, should be today one of the foremost financial institutions, not only in the Maritime Provinces but in the whole of Canada. The splendid growth in assets and resuorces of this Bank are, however, merely a measure of their ability to serve the farmers, the merchants, and the public generally, for the growth of such assets is only possible as a result of public confidence in the Bank. With a paid up capital of $6,500,000, a reserve fund of $12,000,000 and total assets over $150,000,000 it will be seen what a powerful aid to Canadian trade the Bank of Nova Scotia is. Its assets have practically doubled since the end of 1913.

The Bank of Nova Scotia has shown steady progress since it was founded in 1832 and now has 33 branches in New Brunswick, 30 in Nova Scotia, 7 in Prince Edward Island and 85 in the fest of Canada. It has also 20 branches in Newfoundland, also many branches in the West Indies and correspondents in the Uited States, Greot Britain and France.

The Head Office of the Bank of Novo Scotia is at Halifax and a deep interest in the welfare of the Moritime Provinces is and olways has been one of its first considerations.

There is probably a branch of the the Bank of Nova Scotia near you ond your occount would be much appreciated. Your sales cheques, personal cheques will be cashed, your drafts collected and the proceeds sent to you by mail if ncessary—in fact all your banking with us can be done by mail if convenient to you. Our Branch Managers also stand willing to give you friendly disinterested advice at all times on any financial or business matter.

ANNUAL REPORT OF CANADIAN SEED GROWERS' ASSOCIATION

The Fourteenth Annual Report of the Canadian Seed Growers' Association covering the work of that organization for the year ending March 31st, 1918, has just been published and is now available for distribution to those who apply for same to the Publications Branch, Department of Agriculture, Ottwa. The Report opens with a brief statment regarding the origin, constitution, aims and methods of the Association. This is followed by a list of officers and active members.

The Director's Report reviews the conditions of the preceding season and their effects upon the production of seed. It exprsses the Director's appreciation of the continued co-operation of Departmental officials in the different Provinces. The methods of the Co-operative Society at Ste. Rosalie Jct., P. Q. are pointed to as a model worthy of emulation by the other Provinces.

The Report of the Secretary, L. H. Newman, Ottawa, indicates that 285 farmers have aplied for membership during the previous Association year. Of this number 65 have qualified for full membership. Work aiming at the improvement of various crops is dealt with briefly special reference being made to the good work being accomplished by various competitions.

Important amendments made in the Regulations on the occasion of the last annual meeting are published. These amendments make it possible for any farmer to secure seed known as first or second generation Registered Seed and have the imediate progeny of this registered providing the growing crop is inspected and the harvested crop is up to standard. The hope is expressed that this amendment may result in increasing the quantity of good seed in Canada very largely.

SETTLING RETURNED SOLDIERS ON THE LAND

The Soldier Settlement Board has recently increased its activities to a marked extent in the Maritime Provinces. Three new offices have been opened at St. John, Charlottetown and Halifax. The work in the Maritime Provinces is under the direction of Lieut. J. C. Robertson, who has a local representative stationed at each office. Under the new regulation, soldiers who have been discharged from the army, and who make application will receive assistance from the Soldier Settlement Board in the purchasing and equipping of farms, providing that they are adequately qualified. An Agriclutural Qualification Committee has been appointed for each province. This Committee consists of practical men who are qualified to determine the experience necessry in order for the men to make a success of farming in their respective provinces. Wherever possible a returned soldier farmer is a member of this committee. For the province of Nova Scotia, a very strong committee has been appointed, which consists of Prof. J. M. Trueman, of the Nova Scotia Agricultural College, Truro; Mr. F. H. Johnson, Ex-President of the Nova Scotia Fruit Growers' Association, and a prominent farmer, and Capt. Hugh Dickson, who has seen service overseas, and is a well-known stock-breeder and a large farmer. This committee has held one meeting at the Nova Scotia office of the Soldier Settlement Board, and they dealt with all applications that have been received to date. Their next meeting will be held on March 18th, and apparently they will have a very busy time of it, for enquiries and applications are pouring in at a rapid rate. It should be clearly understood by a returned soldier who wishes to take up land, that it will be necessary for him to have at least 10% of the purcahse price of the farm he has in mind, and if he has considerable more than this, it will increase materially his chances of becoming a successful farmer.

The Qualification Committee in the province of New Brunswick consists of Mr. T. W. Caldwell, of Florenceville, Carleton Co., a prominent farmer who is actively interested in the United Farmers' movement, Major Guy Kinnear, of Sussex, and Major J. J. Bull, of Woodstock, both of whom were practical farmers before serving their country on the battlefields of France. At the last meeting of this committee, seventy-two applications were dealt with, showing that much interest is being taken in this movement. The second meeting is being held in Fredericton on March 18th.

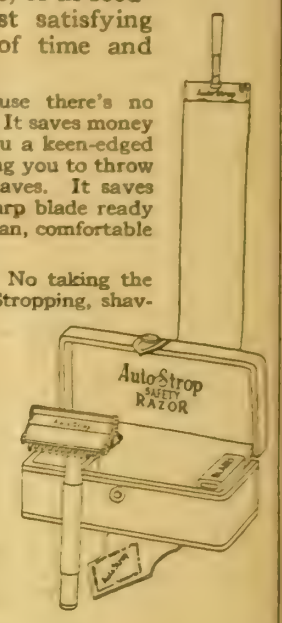
The work of the Board in the province of Prince Edward Island has, up to the present, been looked after by

The progressive farmer naturally prefers an AutoStrop Razor

He prefers it for the same reason he chooses the latest idea in tractors, in separators, or in seeding, because it gives him the most satisfying results with a distinct economy of time and money and effort.

The AutoStrop Razor saves time because there's no fumbling with parts; it's all in one piece. It saves money because its self-stropping feature gives you a keen-edged blade for every shave, instead of compelling you to throw away a blade after only three or four shaves. It saves effort because since there is always a sharp blade ready for use—it enables you to get a close, clean, comfortable shave with the least number of strokes.

To clean, simply dip the razor in water. No taking the razor to pieces and assembling it again Stropping, shaving and cleaning are all done without removing the blade from the razor.



An AutoStrop Razor complete with strop and 12 blades sells at $5; but the dealer will hand you back your money without argument; if the AutoStrop Razor doesn't give you the coolest and cleanest shave you ever had from any razor.

Put a Champion in your grove as early as possible. We can give you the right size at the right price. Write

GRIMM CHAMPION OUTFIT

THE GRIMM MANUFACTURING CO.,
LIMITED
45 Wellington Street, Montreal, Que.

the Minister of Agriculture, Hon. Murdoch MacKinnon, and the legal representative has been J. D. Stewart, Esq., K. C., who will continue to assist. A very efficient Qualification Committee has been appointed consisting of Mr. A. E. Dewar, Charlottetown, Queens Co., Mr. E. B. McLaren, Georgetown, Kings Co., and Mr. Jeremiah Noonan, Prince Co. These gentlemen are practical, every day farmers, who represent every county in th Island and understand thoroughly the factors governing success in farming. A meeting of of this committee will be held in the new officcs, Relief Building, Charlottetown, on March 20th or 21st.

The Maritime Supervisor, Mr. J. G. Robertson, son of R. S. Robertson, Esq., native of Pictou County, being born on a farm in Churchville, Pictou Co., educated in New Glasgow High School, MacDonald Agricultural College and McGill University, from which he received the degree of B.S.A. After graduation he went west and when war broke out, he was General Manager of the Detchon Farms, consisting of 14,000 of land in Saskatchewan, on which they raised over one hundred and thirty thousand bushels of wheat per year, besides large quantities of other grains. His service in France has been with the 44th Battalion and he was severely wounded on the famous Vimy Ridge.

Lieut. Robertson is working in close co-operation with the Provincial Goverments, with the Experimental Farms and with the Great War Veterans' Associations. His assistant in the Halifax office is Sergt. H. H. Congdon, who is a graduate of the Nova Scotia Agricultural College and has seen considerable service in France. In St. John an able assistant has been found in the person of Mr. William Kerr, who was formerly Secretary of the Provincial Farms Settlement Board, and who is well qualified for the position, being thoroughyl acquainted with the farming situation in the province. In Charlottetown, he has associated with him Sergt. N. W. Lother, a native of the Island, who was severely wounded, losing a leg in the service of his country.

It is highly advisable that all returned men who are interested in this work, should make application to any of these offices as soon as possible. Certain procedure has to be followed, preliminary informbtion given, copies of their discharge taken and then farms will have to be inspected by the Board's farm inspector. All officials are anxious to place as many men as possible on the farms this spring providing they are genuine farmers, qualified to farm successfully and have at least ten per cent. in cash of the value of the farm they are settling on.

BROOD MARE BEFORE FOALING

Prior to the birth of the foal, mares should have enough of good wholesome food and water; plenty of exercise; clean, light and altogether sanitary quarters, along with regular attention directed or given by a man who likees the horses and who looks after this matter, not from a sense of profit and loss alone, but because of human interest and duty. On the average farm the problem of exercise is not troublesome. The great difficulty is to find help that will handle brood mares carefully. Brood mares may work up to within two or three days of the date of foaling, and be benefited by it. They should be given moderate but steady work. Such mares should not be given work which requires backing heavy loads, or where there is a chance of slipping. But they can and should be worked. As a ageneral rule, mares doing light work should eat approximately one pound of hay and one pound of grain per day per 1,000 pounds live weight. This matter should be governed, however, by the condition of the mares and they should be gaining in condition with digestion in best of condition as the critical time appraches.

The habit of halter pulling is frequently brought about by the animal becoming frightened in the stall.

Tell the advertiser, when you write, that you saw it in The Maritime Farmer.

Th practical way in which to take care of the plant food fund and to see that there is al ays a balance in favor of the soil, is to feed the greater part of the crops to live stock that will permit the return of the greater proportion of the fertility to the soil from which it was removed.

APPLE SPRAYING IN 1919

An Address by G. E. Sanders at the N. S. Fruit Growers' Association, Dominion Entomological Laboratory, Annapolis, N. S.

Mr. President and Gentlemen:

It is a pleasure to again be called upon to address your annual meeting, and to know that in spite of the greatest handicaps for the past four years, you have so cared for your orchards that they are to-day in practically as good condition as before the Great War broke out in 1914. Every grower, dealer and handler of apples in Nova Scotia to-day realizes the immense opportunity now open to the Nova Scotian apple grower. Even the loud lunged pessimists, who, during the war, have advised you to neglect orchards, and to allow your big permanent asset to deteriorate, perhaps beyond repair, now believe that the Nova Scotian apple grower is on the eve of a great period of prosperity, and they are now preaching care of the orchard as loudly as they preached neglect during the past four years.

I have to deal to-day with the most profitable, as well as the most important, of all orchard practices in Nova Scotia, viz., spraying. We have for the past five years had much uncertainty and unrest in Nova Scotia in regard to the proper material to use in spraying apples, and even yet some are not quite decided as to where lime and sulphur fits as a spraying material. As far as I can see, we will not know all about spraying for some time to come. There are many changes and improvements to be made in the spraying program. Some changes we are sure will come, others will come if we can find new materials that do not possess the defects of those now in use. For instance, we have in prospect a safe insecticide for use in Bordeaux that will cost just half as much as arsenate of lime, and arsenate of lime costs only one half as much as arsenate of lead. We are not sure of it yet, but if it proves up in large tests as we hope, that will be another change that we will recommend you to make. You, as growers, have us at the Dominion Entomological Laboratory at Annapolis, employed to work at sprays and spraying material for you. You want us to help you in cutting costs, increasing efficiency, increasing safety or saving labour in handling spraying material. So long as you have me empolyed, and our tests show us where you can save in cost, time or material or can in any way change your present practices, so as to get greater net returns, I am going to recommend those changes to you. Every change that we have recommended in the past has proved profitable to you, and we do not propose to recommend any new methods or materials to you in the future, until we have satisfied ourselves that the change is to your advantage. Many have criticized us in the past for advising you to change your program of spraying, and have been horrified when the next season we recommended more drastic changes, and the next year even more drastic changes still.

The use of arsenic, in the killing of nsects, began about fifty years ago. The use Bordeaux dates back only thirty five years; while lime sulphur, as we know it as a summer spray, was first used only ten years ago. Knowing this and also knowing that the horticulturists who have experimented with spraying material have known very little chemistry, entomology, plant pathology, and that chemists, entomologists, and plant pathologists who have attacked the problem have for the most part been similarly handicapped. We can account for the survival even to-day of such formulae as equal part lime and copper sulphate Bordeaux with Paris green, lime sulphur and lead arsenate for a summer spray for the apple, and the addition of lime to Paris green to make the latter more safe on foliage, etc.

For the reason given and also for the reason that the science of combining and applying spraying material is more recent than the applying of electricity, and almost as recent as the discovery of the automobile, we do not think that the limit has been reached in the combining and applying of material for the control of insects and plant diseases any more than it has been reached in the applying of electricity or the building of automobiles.

In 1913 when we started the study of spraying material, lime sulphur and lead arsenate were almost universally used for apple spraying in Nova Scotia. The years 1910-11-12-13 when lime sulphur was being introduced, were on the whole bright, warm and sunny and in only a few cases did the combination give the least injury. Nova Scotia is, on account of its maritime location, somewhat deficient in sunlight. On account of temporary climatic changes which we best realize by the cold winters, that we have experienced since 1913, the summers of 1914-15-16-17 were colder and more deficient in sunlight than normal. Last year we showed you that injury from lime and sulphur was greatest in seasons that were deficient in sunlight. This explains the small amount of trouble from lime and sulphur for the first few years after its introduction as a summer spray and the great amount of damage that it inflicted in Nova Scotia during the four years of 1914-15-16-17.

In 1915 when we first became convinced as to the damage caused by lime-sulphur, we knew of no other widely used spray for the apple than 4-4-40 formula lime and copper sulphate Bordeaux. During the past four years we have done a great deal of experimenting and as the matter was urgent in that some men were removing the major portion of their crops by the use of the old formula of lime sulphur and paste lead arsenate, we have recommended changes with a view to safety. First we recommended the weakening of lime sulphur, then the changing from arsenate of lead to arsenate of lime, then the substituting of 7-7-100 Bordeaux for the lime sulphur formula on the fourth spray and finally—for the season of 1918 we recommended that you test a new program in a small way. This program as recommended was as follows, 1st spray, 3-10-40 Bordeaux, 2nd spray, 2-10-40 Bordeaux, 3rd spray, either soluble sulphur or sulfocide, 4th spray, 3-10-40 Bordeaux. We have yet to hear of any damage, other than occasional traces of slight russetting, following the application of this formula. Personally I was convinced as to its value last winter, but did not want to recommend it above all others without at least one seasons trial in a very large way. My own orchard was sprayed according to this formula, as were those of my assistants who have orchards. We also persuaded many of our friends to use it. As a result Prof. Brittain and I are recommending as our 1919 calendar.

1st spray 3-10-40 Bordeaux, Arsenate of Lime 1 lb. to 40 gals.

2nd spray 2-10-40 Bordeaux, Arsenate of Lime, 1 lb. to 40 gals.

3rd spray, Soluble Sulphur, 1 lb. or Sulfocide, 1 quart to 40 gals. Lime, 5 lbs. to 40 gals.; Arsenate Lime, ½ lb. to 40 gals.

4th spray, 2-10-40 Bordeaux, Arsenate of Lime, 1 lb. to 40 gals.

For the-after blossom spray we have reduced the quantity of lime with Soluble Sulphur from 10 lbs. to 5 lbs. to every 40 gallons. The 5 lbs. we find sufficient and more desirable. For the 4th spray, we have reduced the amount of blue stone down to 2 lbs. to 40 gals., as that is sufficient in most seasons for the last spray. There is, however, no objection to making the lats spray 3-10-40 Bordeaux should one have an exceptionally bad orchard in which to control fungous diseases. We have found that at least 3 parts of lime must be used to one part copper sulfate in a Bordeaux intended for apple foliage. If less than 3 parts of lime is used to 1 part of copper sulfate, leaf yellowing and leaf dropping is likely to follow. We do no find any advantage in using more than 5 parts of lime to one of copper sulfate. The use of the Thomson Bordeaux, the eliminating of Bordeaux for the after blossom spray and the making of the pre-blossom spray 2-10-40 Bordeaux practically eliminates rusting in most varieties. After numerous tests we have found arsenate of lime more desirable than arsenate of lead for use in Bordeaux; the most important consideration is cost, Arsenic in Nova Scotia now costing just twice as much in the form of arsenate of lead as in the form of arsenate of lime.

We believe that the spray calendar for 1919 that we are now recommending will remain unchanged for some time, so far as its essential points are concerned. Our previous spray calendars have been put out as emergencies to cut down loss which was following the use of the old formulas; but we did not regard them as final in liquid spraying by any means. There may be some improvements possible in our present system of liquid spraying both in material and cost in the arsenicals for use in Bordeaux. It may be more desirable to have the 4th spray a 3-10-40 instead of a 2-10-40 Bordeaux; it may be also that we can find a third spray that is better than soluble sulphur; but we are satisfied that this calendar will stand in its essential points as a liquid spray calendar in Nova Scotia for several years at least.

We must give to Mr. G. L. Thomson of Berwick, N. S., the credit of first having used in Nova Scotia the excess lime-Bordeaux which is now generally known as Thomson Bordeaux. To Mr. John Buchanan we are all indebted for having demonstrated the value of the formula in a large orchard way. For the past three years the men who have used Thomson Bordeaux have with few exceptions had large crops of apples, while those who used lime-sulphur have generally suffered. With the substituting soluble sulphur for the after blossom spray, the russeting of the fruit is practically eliminated, and where our 1919 spray calendar was used in 1918 the foliage to all appearances was perfect.

I am not gonig to weary you with an exhortation to spray your trees; that to this audience, in fact to any representative Annapolis Valley audience would be superfluous. You have had it demonstrated to you in every section that sprayed orchards give larger and more even crops, and cleaner crops; that spraying even in the old way, would on an average about double the value of the crop of apples. What has been troubling you is the thin and in some cases very light crops that you get on some varieties when you spray with lime-sulphur and the inefficient control of fungous that you get in some seasons and on some varieties. You do not need nor want to be told to spray; you even found spraying with lime-uslphur a profitable opeartion on most varieties and in most seasons. You were all satisfied that you could not afford to drop spraying even if nothing better ever developed than lime-sulphur, but knowing from experience and observation that lime-sulphur would often appreciably reduce your crops of Wagner, Blenheim, King, Ben Davis, Bald-

(Continued on page 714)

N. B. Potato Growers Convention

The New Brunswick Potato Growers Association held its fourth annual convention in the Fisher Memorial School, Woodstock, on March 19th and 20th. Despite the fact that the cost of production in all its phases was abnormally high during the past year so that many of the growers who have already sold their crops will have only a very small margin of profit and while it is doubtful if present holders will barely realize the amount of their fertlizer bills, there was no whining but a seeming determination to go forward, building solidly on the sure and safe foundation of producing quality products.

A. A. H. Margeson, one of Carleton County's progressive potato growers, was president of the Association during the past year. His re-election to office by acclamation, for the ensuing years met with hearty approbation.

James Bremner, one of the live wires in the agricultural life of the Province, is secretary, having been appointed to office on the resignation of Mr. A. C. Taylor last fall. Mr. Bremner, as agricultural representative for the counties of Northumberland, Gloucester and Restigouche, has been doing good work in encouraging the production of a better class of seed potatoes by the organization of seed centres in the district.

The convention opened with a few appropriate remarks by the President followed by a resume of the year's work and the Treasurer's report, submitted by the Secretary.

The Treasurer's Report

Balance from last year and receipts	$891.71
Expenditures	707.20
Balance on hand	$184.51

Committees

Resolution.—W. W. Hubbard, J. C. Cook and Alex Brewen.

Nominating.—T. H. Manzer, T. J. Hart and Murray Hajerman.

Membership. — Jas. Bremner, E. Palmer and John Inch.

Fungicides and Insecticides

The last word on fungicides and insecticides was given to the convention by Geo. E. Sanders, officer in charge Dominion Entomological Laboratory, Annapolis Royal, N. S., in a carefully prepared paper. Mr. Sanders is considered by all who know the good work he is doing and the results he is accomplishing in research work on insecticides and fungicides, to be one of th ebest authorities on the subject in America. He is a born investigator of the type that is always looking for something better. He has saved the fruit growers of the Maritime Provinces thousands of dollars by some of his discoveries. The potato growers of New Brunswick will be well advised to make the utmost use of Mr. Sanders and his fund of practical experience. He purposes carrying on a number of investigations and demonstrations in New Brunswick this year. The potato grower, like the fruit grower ,must spray in order to produce quality products. There must be a constant warfare against fungus and insect pests. To successfully combat these pests with maximum efficiency and minimum cost is Mr. Sanders' life work. The success he has already attained and the reputation he established by dint of thorough, practical work, evokes the hearty congratulations of myriads of his friends in the Martime Provinces and every other part of the North American continent. Extracts from Mr. Sanders' address will appear in a future issue.

Potato Diseases

"Potato Diseases and the Policy of the Pathological Laboratory in Regard to Better Seed Potatoes," was the subject of an interesting talk, illustrated by lantern slides, by P. A. Murphy, officer in charge of Dominion Field Laboratory, Charlottetown.

Condition vary in different sections of Canada in the degree of success in potato growing that necessitated the importation of clean, vigorous seed potatoes into districts where the potato does not grow so vigorously. To locate, certify and tag for shipment the best grades of disease free, vigorous tubers, is one of the aims of his department. Many of the troubles evidenced in the growing crops in the fields cannot be recognized by the average farmer in the stored tubers. In order to be sure of getting only the best it is necessary to have a system of field inspection. The vigorous quality of Nw Brunswick grown tubers is repsonsible for the comparatively larger yield procured from their use in other parts of Canada than that procured when these sections use home grown seed.

Mr. Murphy's department also aims to put grower in touch with grower. Northern Ontario is destined to be a strong competitor in the production of good seed and it behooves New Brunswick to look well to their laurels. A carload of potatoes does not bring a price in advance of the current price for the poorer quality of its contens. Mr. Murphy and his assistants are striving to have the tubers in each car uniform so that the producer or shipper who grows quality products may not have to take lower prices because some careless grower may have shipped in a quantity of inferior potatoes. During the coming season the progressive grower of potatoes who may wish to get inspection for his crop, is advised to ask for inspection, particularly if one or more carloads of good seed stock is procurable in his district.

Mr. Murphy advised the growers to always keep the purchaser in view. Quality goods bring repeat orders. New Brunswick growers must strive to maintain the very best reputation possible for seed stock if they are to compete successfully in the Ontario and Southern markets. The various illustrations thrown upon the screen forcibly emphasized many of Mr. Murphy's suggestions.

Mr. Margeson outlined several observations re some of the spraying experiments which he had conducted on his own farm, all of which went to show that the increased production and the subsequent keeping quality of tubers from sprayed plots paid the farmer handsomely for any trouble and expense incurred through spraying.

J. C. Cook, of River Charlo, Restigouche County, also paid a tribute to the results he had procured by spraying, by selection and the elimination of diseased plants. Mr. Cook is a firm believer in hill selection as a means of propagating a high producing strain. He looks forward with considerable optimism to the seed centres organized in his county by Mr. Bremner, their Agricultural Representative. Although they have only started in a small way he believes several car loads of quality stock will be procurable in his vicinity next fal.

Community Potato Work

Dan Dean of Nichols, New York, one of the Empire States most prominent potato growers, gave a very practical address on "Community Potao work and its Results." His remarks were direct and to the point. He said the man who is a planter of potatoes should look well to every link in the chain of production. This chain is no stronger than its weakest link. It makes no matter how much care a man gives to the majority of the links, if he neglects to put forth his best efforts to make the other links effective, his margin of profit will be lowered. Every link should be attended to in its own season no matter what other lines of work had to be delayed. Mr. Dean is a strong advocate of the hill selection system and rigidly pracitices it in his own potato growing plan. This is one of the links in the chain that will materially help to reduce the production of seconds and culls to a minimum. The true test of the potato growers' chain is the difference between the price received and the cost of production and marketing. The extra potatoes that strict attention to every detail will produce in many cases the margin of profit. It is a waste of energy to strengthen some of the links and neglect the others. The producer must cater to the consumer's needs. The consuming public know their own requirements and will pay a premium for the clas of goods that satisfy their needs, but the quality must be delivered in order to get the price.

The grower must also realize that every load of potatoes shipped from the farm means just a slice off the farm and unless its equivalent in soil fertility is returned to the fields on which the crop was produced the stock of plant food will soon become depleted, to the detriment of both city and country.

He outlined how he had been able to build up the fertility of a badly run down farm to a yield of upwards of three hundred bushels of potatoes per acre by a systematic system of crop rotation consisting of potatoes, oats and clover hay. On the lighter soils in order to get a sod and subsequent catch of clover he seeded down with red top, then with timothy and finally with clover.

The successful grower must pay strict attention to the varieties grown. Some strains of the same variety are more productive than others, consequently it is a good plan to test seed procured from various sources and grow only the most productive strain. The seed should be disinfected prior to planting as a safeguard against several diseases. Misses in a field are expensive. Plant the kind of seed that will give the least percentage of misss. Spray the tops early and continue spraying thoroughly throughout the season so that each plant may be armored against infection by late blight which so often causes dry rot. Use a hfgh pressure spray outfit.

Mr. Dean also showed several slides depicting various types of spray rigs. One feature of his spray machine is an attachment consisting of raking machine teeth set on both sides of the wheels in such a way that they may be raised when not in action and lowered when in action to lift up the potato vines out of the wheels. The speaker said he could never see any

Exclusive Seed-Dropping Device

Times have changed. It is the farmers with up-to-date machines that are catching the big prices of the early markets. The O-K Canadian Potato Planter gets your seeding finished earlier and better, with saving of seed and valuable time in busy season.

This is the only machine that can give you the endless cup system, the most accurate seed dropping device ever invented. It demonstrates close to 100 per cent. efficiency, and leaves absolutely but one seed per hill. That means seed economy, worth any man's while to have on large acreages and it means fewest dead hills:

O-K Canadian Potato Planter

The endless cup system picks up and deposits seed on revolving plate with a compartment for each seed in full sight of operator on rear seat. It does not pick or bruise the seed.

This machine has extra large fertilizer equipment. Two shoes open up the furrow. One makes trench for the fertilizer; the other mixes up the fertilizer with earth so that it cannot touch the seed. Yet the seed gets the full benefit of the necessary plant food. It also makes the trench deeper for reception of the seed. Fourteen-inch discs are easily operated, working the covering earth into any desired shape.

A Sandford, Fla., user writes: "There is no question in my mind that from the standpoint of light draft, durability, accuracy in planting, proper distribution of fertilizer and general manipulation, adjustment, etc., it is the best potato planter on the market."

Our free catalogue gives full particulars of Potato Planters and Diggers, also testimonials. Write to-day.

CANADIAN POTATO MACHINERY CO., Limited

Makers of the Famous O-K Potato Sprayers

28 STONE ROAD, GALT, ONTARIO

O-K CANADIAN Potato Cutter

Simple, accurate, convenient, strong and durable; cuts 6 to 7 bushels per hour compared to one bushel by hand.

sense in spraying to protect the tops from injury if the farmer while spraying cut off a lot of branches with the wheels of his spray rig. In reply to a question as to the best time to cut potato sets he advised cutting on the day of planting.

Seed Centres

Jas. Bremner outlined the work of the seed centres on the North shore.

Potato Problems

"Potato Problems Solved and Unsolved" were discussed by W.W. Hubbard, Supt. of the Experimental Farm, Fredericton. We will publish Mr. Hubbard's address in a future issue. Several of the points brought out in the address aroused some very intertesing discussions.

E. P. Bradt, Deputy Minister of Agriculture, expressed Hon. J. F. Tweeddale's regrets at being unable to attend the convention, owing to press of partliamentary duties. Mr. Bradt also paid his tribute to the value of good seed and instanced some of the favorable results that had been achieved by the use of New Brunswick grown seed potatoes in his native province. There is a demnaad in Ontario for New Brunswick seed stock because the yields therefrom are satisfactory. Northern Ontario, however, is a keen competitor for the trade and New Brunswick growers will be well advised to produce and sell only quality goods.

Potato Work at Ottawa

W. T. Maconn, Dominion Horticulturist, who has the opportunity of keeping in close touch with potato growing in all part of Canada said in the course of his address on "Potato Cultivation and Work at Ottawa Experimental Farms" said it is interesting to note the variations in yield produced by the same strains in different sections. He said that at the Experimental Farm, Ottawa, New Brunswick grown seed had on many occasions given four times as much yield per acre as Ontario grown seed. He ventured to say that were Ontario farmers to use New Brunswick seed exclusively they could annually double the yield they are procuring from seed of their own growing. To keep in favor, however, New Brunswick must not lag in the work of seed imrpovement. Wonderful results may be achieved by breeding up strains of high producing quality. Aim for the kind that will produce 100 per cent. strong, healthy plants. On one-twentieth of an acre he had succeeded in growing at the rate of 1,024 bushels per acre with a strain of Rural New Yorker. He had found that seed somewhat immature gave better results than over-ripe seed. Immature seeed the result of early harvesting gave better results than seed of a similar nature from late planted stock.

He also gave the results of experiments conducted to ascertain the times when tops and roots and tubers make the most growth. He strongly emphasized the necessity for thorough cultivation as a safeguard against a droughty spell during the growing season.

Potato Grading

Quite in line with the best sugestions as to the strengthening of every link in the potato business, G. G. Porter, one of New Brunswick's most prominent potato shippers, drove home some practical arguments re the necessity for a system of potato grading for market. We will publish Mr. Porter's addres in full.

W. W. Fawcett, of Sackville, expressed his appreciation of Mr. Porter's suggestions.

A resolution endorsing Mr. Porter's suggestions was carried without a dissenting voice.

Soil Fertility

The question fo soil fertility was interestingly dealt with by Mr. E. M. Taylor, of the N. B. Department of Agriculture staff. He outlined his investigations into soil conditions throughout the province to ascertain quantities of lime necessary to correct acidity in the respective counties. He favored a great range of variations and abundant evidence to show the necessity for the sweetning the soil by the use of limestone. The time at his disposal did not permit of a lengthy discussion of the various features which he would like to outline.

Mr. Taylor is a born investigator and one who has without doubt the best grasp of soils and fertilizers in the province. His services are at the disposal of the farmers of the province and it is always a pleasure for him to render assistance in investigating soil problems.

H. B. Durost expressed the view that the Fertilizer Control Law shoufd be made more stringent, particularly in the matter of the declaration by the manufacturers re the availability of the nitrogen, phosphoric acid and potash content, rather than the very broad statements which are now printed on the tags but which are frequently misleading.

Resolutions

The following resolutions were carried unanimously favoring compulsory potato grading and the establishing of the same standards as are now in effect in the United States.

Opposition to the Daylight Saving Scheme.

Endorsation of Thrift Campaiagn as is now conducted by the purchase of War Savings StaSmps.

Concurrence in the idea of stock yards, abbatoir and cold storage plant for the Maritime Provinces.

Officers for Ensuing Year

The election of officers for the ensuing year resulted as follows:

President, A. H. Margeson, Centreville.

Vice-President, John Inch, Burtts Corner.

Secretary, James Bremner, Chatham.

Treasurer, W. H. Moore, Scotch Lake.

Auditor, C. O. McDonald, Woodstock.

Advisory Board

A. C. Taylor, Salisbury; W. W. Fawcett, Sackville; B. J. Hart, Woodstock; J. C. Cook, River Charlo; F. E. Henderson, Andover.

The Potato Show

The potato display although not extensive was bristling with quality. If New Brunswick growers would see to it that they attended properly to every link in the chain of production the ideal set by the exhibits at the show would be attained by the greater percentage of the crop.

S. J. Moore, of the Seed Division, and W. T. Macoon, Dominon Horticulturist, placed the awards.

Prize Winners at the New Brunswick Potato Growers' Show

Green Mountain Group, 15 entries.—1, Ernest Inch, Burtts Corner; 2, W. E. Palmer, Scotch Lake; 3, Clifford Rideout, Hartland; 4, G. M. Hajerman, Jacksonville; 5, A.D. McMillan, Grand Falls; 6, J. Walter Inch, Burtts Corner; 7, Henry Gordon, Chatham; 8, B. J Hartt, Jacksonville.

Irish Cobbler Group, 16 entries.—1, B. L. Shaw, Upper Woodstock; 2, W. E. Palmer; 3, H. B. Parlee, Sussex; 4, Henry Gordon; 5, Chas. Palmer, Woodstock; 6, P. R. Semple, East Florenceville; 7, Richard Barker; 8, Edwin Estey, Woodstock.

Any other White Variety, 4 entries.—1, W. E. Palmer; 2, A. A. Margeson; 3, J. Walter Inch; 4,Ernest Inch.

Any Rose Variety, 3 entries.—1, W. E. Palmer; 2, J. Walter Inch; 3, Ernest Inch.

Any Red Variety, 4 4entries.—1, W. E. Palmer; 2, Ernest Inch; 3, Walter Inch; 4, A. A. H. Margeson.

Potatoes Exhibited for Final Scoring from fields entered in Summer Potato Growing Contests

Seed plot of 500 hills (exhibit of 10 individual hills)—1, A. A. H. Margeson; 2, Clifford Rideout.. 3, Ernest Inch;4, B. J. Hart, Jacksonville; 5, E. L. Hume, Florenceville; 6, W. E. Palmer; 7, P. P. Semple.

Two acres of Irish Cobblers (1 bus.) 14 entries.—1, W. W. Fawcett; 2, E. Lorne Hume; 3, Basil C. Palmer, Woodstock; 4, P. R. Semper; 5, T. M. Hajerman, Florenceville; 6, Ed. A. Estey, Woodstock; 7, R. A. Snowball, Chatham; 8, B. L. Shaw; 9, Spafford Manzer; 10, B. J. Hart.

Five acres of any variety of Green Mountain Group (1 bus.), 4 entries.—1, W. W. Fawcett; 2, Ernest Inch; 3, Spafford Manzer; 4, A. A. H. Margeson.

TWO MILLION DOLLARS FOR N. S. FARMERS

A conservative estimate of the loss to the grain growers of Nova Scotia through smut is 16% of the total crop. The value of this year's crop is placed at $7,000,000, and the loss on this score alone would figure out at over $1,000,000. Smut on grain can be very easily controlled by treating the seed with formalin solution. One pint of formalin is mixed with 30 gallons of water, and the seed then dipped in bags into this mixture. It is then allowed to dry out.

This year's potato crop is estimated at $8,000,000, and the losses through rot at 25%, or $2,000,000. Of this total loss at least one half could be prevented by thorough spraying. Many farmers, of course, are already taking this precaution, but among these there is a good deal of haphazard and slipshod work, while the great bulk do not spray at all. Any potato grower who is not satisfied with the results obtained or with the information at hand would do well to write the Agricultural College, Truro, N. S., or Dominion Experimental Farms. With a greater supply of labour available, every farmer will be anxious to stop these vast leaks.

CHARLOTTE COUNTY EXHIBITION WILL BE OPEN TO THE PROVINCE THIS YEAR

The Charlotte County Exhibition to be held at St. SteSphen, September 9th to 12th inclusive, instead of being the usual County affair, will this year be open to exhibits from all parts of the Province of New Brunswick. In other words, instead of being a County Exhibitiin it will this year be Provincial.

The Charlotte County Exhibition has always been a strong drawing card bnut this year's show will eclispse any yet held.

Look for the Rennie Seed Display

15,000 dealers throughout Canada are ready to supply you with these tested seeds.
It's time to think about planting your back-yard garden. Make your selections now.

Sow RENNIE'S Seeds

The wide variety of the Rennie line assures you of obtaining just what you want in either flowers or vegetables.

All Rennie's Seeds are tested for germination and their quality proven. Should your dealer be unable to supply all the seeds you require, write us direct.

RENNIE'S SEEDS

The N. B. Farmer's and Dairymen's Convention

(Contiuned from last issue.)

Mr. A. J. Doucett thought there seemed to be altogether too much fault finding and too much bickering. It is fully time tha an armistice be consumated between the producers and the consumers. He outlined various aspects of the co-operative movement that has come to his attention from time to time that are working to the mutual advantage of the two classes.

Mr. J. E. McAuley, of Kings county, put forth a plea for the re-establishment of many of the grist mills that have gone into disuse in various sections of the province that in the past years were a great convenience to wide sections of the county whose farmers, under present conditions, must go long distances in order to get their grain ground. He produced samples of flour, whole wheat and cream of wheat produced by his French-burr mill that gave evidence of good workmanship. A resolution favoring Mr. McAuley's suggestions was subsequently introduced but was defeated by an overwhelming majority.

The very live subject of co-operation was the theme for the afternoon discussion. Mr. J. D. McKenna, manager of the Maritime Farmer and Secretary of the N. B. Agricultural Societies United, delivered a rousing address dealing with many phases of this great movement. He outlined many of the obstacles that the "interests" that derive their living as middlemen have from time to time placed in the paths of farmers who would co-operate. They try to thwart the movement from many unsuspected angles but their ear marks are soon revealed. Manufacturing concerns and some banks, that would not do business with organized bodies of farmers working co-operatively a few years ago, have changed their tune and now they are anxious for this desirable class of trade. They see the handwriting on the wall and are beginning to govern themselves accordingly. It was a case of get in the swim or lose a lot of good business that was sure to go by their doors unless they got in while the getting was good. The speaker had been confronted with many problems of this kind but he was glad to assure the audience that the future would see the evils referred to receding into the back ground of the dim and distant past.

He outlined the system under which he has been purchasing feeds and distributing them at cost to the farmers of the Maritime provinces who had taken the opoprtunity of the offers he had made from time to time in these columns. Fertilizers were purchased through the agency of the N. B. Agricultural Societies United, the workings of which organization he outlined in detail. He concluded his address with a plea that afrmers might stand together regardless of party affiliation and send to our legislative halls broad minded, practical farmers who are fully cognizant of the needs of their fellow craftsmen.

Mr. A. E. McMahon, manager of the United Fruit Companies, Ltd., of Nova Scotia, delivered an interesting address in the course of which he outlined the co-operative movement, as it applied to the organization, development and subsequent success of his company. Mr. McMahon's address was highly appreciated and will be published in these columns, in a future issue.

The sessions from four to six o'clock of each afternoon was handed over to the French speaking delegates to give them a chance to hear practical talks in the language they best understand. Rev. Fr. Lagasse, Rev. Fr. Sormany, Rev. Fr. Landry, Rev. Fr. Doucett, Rev. Fr. Richard, A. J. Gaudet, J. E. DeGrasse and A. J. Doucett held their audiences in an interesting attitude during the periods at their disposal. We have been promised a synopsis of some of these addresses, which we are told contained many ideas of value to every member of the Association. The final session of the Acadian portion of the Convention was terminated by the singing of the Acadian National Anthem in the Acadian tongue and God Save the King in well rendered English, with a vim that bespoke every evidence of enthusiasm.

The Wednesday morning session was devoted to fifteen minute talks by various members of the staff of the Department of Agriculture.

Mr. Bradt, the Deputy Minister, led the way and in the course of his introductory remarks said that when coming to the province as a stranger, he had been wondering what kind of men he would find at the head of the various divisions of the department. After two months of close observation of the various men and their work, he was satisfied that for devotion to their duties and untiring efforts to make their respective departments be of the utmost service to the farmers of the province, and in capability they need not take off their hats to the officials at the head of similar divisions in any of the provinces of Canada.

Messrs. Bremner, Taylor, Hicks, Sharp, Turney and McCullough and MacLeod outlined the work of their respective departments and urged the delegates to convey to their respective Agricultural Societies on their return home, any expressed ideas that would tend to promote the welfare of the farmers of their home districts.

Mr. Bremner dealt with live stock; Taylor, fertilizers and lime; Hicks, seeds; Sharp, immigration; Turney, horticulture; McCullough, poultry. M. A. MacLeod addressed the audience in regard to Agricultural Society work during the Thursday sessions.

The various committees reported on Thursday morning, and the resolutions found elsewhere in this issue were carried.

The Treasurers' report showed:

Balance from 1917	$124.96
Receipts during 1918	207.00
Expenditures during 1918	256.68
Balance on hand	75.28

Premier Foster, who had found it impossible to be present in his scheduled place on the Wednesday evening programme, was in the hall on Thursday morning by request, and was pleased to address the delegates for a few minutes. He had listened to some of the discussions on several of the resolutions, and he congratulated the farmers for the business like progress of their deliberation. Some thing which he said could not be said at times about the deliberations of the Assembly over which he presided. He liked the idea of promptness in all lines of business. He too advised the farmers to get themselves into line so that their industry might be independently represented on the floors of the legislative halls.

The election of officers resulted as follows:—

President—C. F. Alward, Havelock.

Vice-President—J. E. DeGrace, Shippigan.

Recording Secretary—Kenneth Fiske, Florenceville.

Corresponding Secretary—A. J. Doucett, Notre Dame.

Treasurer—H. H. Smith, Hoyt Station.

County Vice-Presidents:—

Albert Co—T. A. Goggin, Elgin.

Carleton Co.—Scott A. Shaw, Hartland.

Charlotte Co.—Wm. McGibbon, Moores Mills.

Gloucester Co.—R. W. Melanson, Bathurst.

Kent—F. O. Richard, Bretagneville.

Kings—O. W. Wetmore, Clifton.

Madawaska—Denis Z. Daigle, Lake Baker.

Northumberland—A. G. Dickson, Chatham.

Queens—John McNamara, Youngs Cove.

Restigouche—L. R. Somers, Anderson.

Sunbury—H. D. Mersereau, Hoyt.

St. John—A. F. Johnson, Loch Lomond.

Victoria—F. C. M. Peoples, Perth.

Westmorland—Frank C. Fawcett, Sackville.

York—Wm. Illingworth, Kingsclear.

Wm. Kerr of the Soldiers' Settlement Board addressed the convention on the work of the Board, and advised farmers to help them get in touch with vacant and for sale farms in their home districts, and in getting in touch with farmers who desire some extra farm laborers.

Feeding the Dairy Cow

was the subject of an interesting address by Prof. E. S. Archibald, Acting Director of Experimental Farms, Ottawa, and Dominion Animal Husbandman, which will be published in an early issue of the Maritime Farmer. The various points emphasized by Prof. Archibald were such as any farmer may well practice. Every portion of the address bristled with practical ideas of how a maximum milk production may be secured and maintained with a minimum outlay for feed.

Prof. Archibald is one of the Maritime Province young men who has made his mark in his chosen profession, and of which his acquaintances are justly proud

Mr. Hubbard announced the train arrangements for the visit to the Experimental Farm for Friday's programme.

The customary votes of thanks to retiring officers, city fathers and speakers that had helped to make the convention a success were tendered. The French delegates expressed satisfaction at the fair and square deal that had been accorded them, and put themselves on record as being determined to put forth their best efforts to advance the work of the Association during the ensuing year.

The Friday session at the Experimental Farm was enjoyed by all concerned. Over two hundred delegates sat down to the bounteous mid-day repast served under the auspices of the genial Supt., W. W. Hubbard.

After lunch, W. W. Hubbard, Prof. E. S. Archibald, Prof. W. S. Blair, Supt. Wiley Baird of Nappan, Geo. E. Sanders and Mr. Williams delivered interesting talks on various phases of Experimental Farm, Live Stock, Horticulture and other Agricultural work.

At five o'clock the delegates returned to Fredericton, loud in their praises of the treatment accorded them at the farm and of practical ideas that the various speakers had advanced—ideas that will help the farmers over some of the problems that confront them throughout the year.

A. C. Fawcett Address

Now that the war is over, and our soldiers are fast returning to the land of their birth, to again take upon themselves the duties of citizenship, in providing a living for their loved ones. Perhaps there is no other problem so agitating the public mind today, as the continued high cost of living.

The prevailing idea of most all our people, who are not farmers "seems to be" that those who till the soil. will not do their dtuy to other classes. That they do not work as they should; that they are not scientific, and modern in their methods of farming, and consequently do not produce a sufficient supply of food, to lower the prices to those who are not producers. And we find many of the leaders of those classes "who do not produce food," violently proclaiming that all farmers are narrow, and selfish, and that they are organizing for the purpose of raising the price of food unnecessarily.

Various means have been taken by the Governing classes of Canada, to remedy this supposed evil. We have had for years a perfect deluge of writing, and speech-making from those who do not themselves provide food. Some with the hope of changing the moral standard of those supposed stiffnecked, and perverse agriculturists; call them bad names such as Slackers, Grafters and profiteers.

Still Mr. President the problem is not solved. Food grows steadily higher, and the breach between the food producing, and non-producing classes rapidly grows wider; as evidenced by the changed methods of our would be teachers, from an attitude of moral suasion a few years ago, to one now of bitterness, and in many cases vindictiviness.

Ladies and Gentlemen of N. B., if the conditions are as I have stated, "why are they so". Are they the natural outcome of an evolutionary process, or are they the legitimate result of the handling of agricultural affairs, by the governing classes of Canada; who as a rule have had no knowledge whatever of the farmers difficulties, nor of his aspirations.

I feel that much of the trouble of to-day may be directly attributable to that school of thought, of which Dr. Roberson, has been the noted leader. When the Dr. was called upon to prescribe for the enfeebled industry, of agriculture nearly forty years ago; he advised that Canada's greatest need was, more skill mong her farmers, and forth-with proceeded to apply the remedies, which in his opinion were necessary. And we have the whole elaborate system of Experimental Farms, illustration trains, bulletins by the ton, and ever growing legions of District Representatives, Inspectors, Lecturers, and other helpers too numerous to mention.

This system still prevails, and is serving the purpose of a complete camouflage, to deceive the honest consumers, and a few farmers who take their marching orders from politicans, who are interested in forcing down the price of products of the farm, and look complacently on while nearly every article, which the farmer has to buy, goes steadily higher.

In the meantime a few well trained, special-privilege Artists, are manipulating legislation in every part of Canada, and receiving their reward, in excessive profits obtained through the system of bonuses, freight rebates, high protection, and many other similar, get-rich-quick schemes.

I believe that those who originated this system of dealing with agriculture, were not altogether sincere; and that the purpose was not to actually improve the financial position of the farmer, but to persuade him to raise more food, which would naturally drop the price to the consumer.

We do not hear of Canadian farmers being stupid, or slothful, when they leave the farms for more lucrative jobs in the City; or on the railways, neither did we hear of the Boys from Canadian farms failing to do their duty, when they met the armed warriors of a modern Attila, on the fields of France and Flanders.

If Canadian farmers can leave the from, and compete with other classes in any and every department of life's affairs, over all this earth. If they can go among the fighting Nations of the world, and win the reputation of being the most brilliant of them all, and if these same men can not make an ordinary success on the farm, where they were born, and reared. "What do you think is the cause" I say to all

those who are non producers; do you need further proof, that the whole system is wrong, and the fault does not lie with the farmer. If so, the fact of a steady decrease in rural population, in all Eastern Canada, should prove to thinking people that something is radically wrong.

Farmers cannot get sufficient capital to carry on the business of agriculture profitably, though money is available for every other business ni Canada. "Actions speak louder than words." Big financiers talk smoothly of the successes to be obtained at farming, but all their money goes into some business favoured by the Government, and not a dollar for Food production.

Mr. Black, chairman of the land settlement board, tells the soldiers whom he is advising to go back to the land, that the price of farm machinery today, is about on a par with two dollar wheat. He warns these prospective farmers however, that the wheat will fall to one dollar per bushel, and promises that the price of farm machinery will fall in the same proportion.

The Hon. Minister of public works, also fore-casts the lowering of wheat to $1.00 per bushel, but he has been too long in the political game to make any such prophecy regarding the products of our Canadian manufacturers. Mr. Crearer can raise a little breeze, in his Western home about the farmers having the same rights as the manufacturers of the East; but on his arrival at Ottawa, just one look from Hon. Mr. White's well trained eye, knocks all such nonsense out of the brain of the Minister of Agriculture, and he forthwith hastens to take a back seat.

All farmers of Canada, did struggle manfully through the war to produce an abundance of food, that the world might be made safe, for all Nations, and classes of people.

And contrary to the prevailing opinion of practically all City and Town people, this excess supply of food was mostly produced at a loss except in the case of wheat when our Government was forced by the organized farmers of the West, to fix and guarantee a price which would be profitable to them.

Millions of bushels of Potatoes have been grown in Canada in the last two years, at a loss and this after Government officials had promised the farmers that the surplus would be shipped to Europe. This has not been done, and the authorities have neglected another real opportunity to strengthen the position of the farmer.

But instead food control boards were established all over the Dominion to force down the price of the farmers products, while no action was taken to lower the price of Coal Oil, Gasoline, Boots and Shoes, and all other commodities the farmer has to buy.

We do not wish to critize unduly the labor organizations for seeking, and securing much higher pay and shorter hours, but would respectfully suggest that if they are to have a six hour day, and still higher pay; that farm produce will raise in like proportion. If tradesmen should only work six hours each day, the same rule must apply to farmers, and under present conditions the only way open to the farmer is to protect himself financially by curtailing the production, which course alone, will raise the price to a paying basis.

I deny absolutely the charge that the farmers are incompetent or unduly selfish, and assert that if the non-productive classes want more food, and cheaper food, "It is up to them, Being in a majority" to call together a parliament of practical farmers to devise means to restore the equilibrium of trade in Canada.

In the meantime they must get in a state of mind, "Which can only be produced by prayer and fasting;" that will make them willing to give up their protection, bonuses, and all other special methods of getting something for nothing out of the public treasury.

The Convention endorsed the following resolution recently passed by the Maritime Stock Breeders' Association.

WHEREAS, owing to the limited local markets and lack of access to export markets except by shipping livestock long distances with consequent heavy losses an depreciation in value, the prices received by the farmers of the three Maritime Provinces for their live stock are very unstable and at best considerably lower than corresponding prices received at such export markets as Toronto and Montreal.

AND WHEREAS the condition has had a very depressing effect upon the raising of cattle, hogs and sheep which are very essential to sound agricultural practice,

AND WHEREAS it appears that this problem can only be solved by a policy that will give the live stock men of the three Provinces convenient access to a stock yards and abbatoir and cold storage of sufficient capacity to meet the immediate needs and provide for future growth.

AND WHEREAS the working out of such a policy involves inter-provincial and export trade,

THEREFORE resolved that the Maritime Stock Breeders' Association do petition the Honorable, the Minister of Agriculture at Ottawa to secure the services of an expert in live stock marketing immediately to investigate through, and with the assistance of the executive of the Maritime Stock Breeders' Association, the condition in the three Maritime Provinces and to make abbatoirs and stock yards, which when executed will bring about the much needed improvement in market facilities and stimulate breeding of all kinds of live stock in the Maritime Provnces.

Presented by W. W. Hubbard, I. W. Baird.

Resolved that the New Brunswck Farmers' and Dairymen's Association in convention assembled, place itself on record as being opposed to the introduction of the Daylight Saving scheme in the Province of New Brunswick for the season 1919.

Further resolved that our Provincial Legislators be asked to oppose any attempt having for its object the introduction of such a measure.—L. M. Anderson, H. H. Tingley.

Whereas scrub bulls running at large are a menace to public safety and a detriment to farmers who are striving to grade up their herds by the use of pure bred sires, and,

Whereas the present law is not strictly speaking, enforced by the municipalities of the province,

Therefore resolved that the New Brunswick Farmers' and Dairymen's Association in convention assembled, hereby request the Government of the Province to enact a law that will legislate scrub bulls off the public roads and commons of the province.—Maynard Smith, F. W. Buttimer.

Resolved that this Convention heartily endorse the following resolution, recently pased by the New Brunswick Dairymen United:

"Whereas the world war is about to be terminated successfully to the Dominion of Canada and whereas that from now on will come a period of readjustment of the Agircultural industries in Canada and whereas it is generally agreed that large portions of New Brunswick are well adapted to dairying and whereas to bring about the necessary changes to make the citizens of New Brunswick realize the opportunities that lie before them in dairy work a very progressive and effective means of education will have to be effected, and whereas a beginning has been made along this line through the medium of the Maritime Dairy Sihool carried on in connection with the College of Agriculture at Truro, N. S., supported financially and otherwise by the three Maritime Provinces and whereas the present buildings, plant and equipment are not large enough for the development of the school, be it resolved that the New Dairymen United in convention assembled place such appreciation on record for the good work that has been done in the past in getting the dairy interests of the Maritime Provinces centred together in the Maritime Dairy School. That it is convinced that better and more efficient work can be done through the medium of one school of sufficient size and capacity than more. That a school of this class should be purely Maritime, that is, owned and operated co-operatively by the three Maritime Provinces. That just as soon as possible a school of sufficient size and with proper equipment to best accomplish these purposes to bes established. That a committee of three be appointed from the New Brunswick Dairymen United to present the sesolution to other interstd associations and also to the proper Government officials in the different Provinces."—A. J. Gaudet, M A. MacLeod.

Whereas the greatest draw-back to Agriculture in ths Province is the continuous exodus from our farms of our young men and young women, and

Whereas to retain this much needed class of our population on the farm so that they may become intelligent and useful members of the Agricultural fraternity it is necessary to improve the social conditions and whereas thei rimprovement can best be brought about by fostering primary education in our rural scools, and,

Whereas this phase of education can best be brought to a high standard by retaining our already duly qualified teachers, and,

Whereas the teachers are leaving their profession and embracing more remunerative walks of life,

Therefore resolved that this Convention of the Farmers' and Dairymen's Association humbly ask the Board of Education to consider the advisability of increasing the educational grants to teachers.—A. J. Doucett, J. E. DeGrasse.

Whereas the Department of Agriculture of this Province publishes for free distribution various pamphlets and leaflets on the different phases of this Agricultural industry, and

Whereas about one-third of the populaton of this Province are French speaking, practically all belonging to the Agricultural classes, and

Whereas the majority of the people are not sufficiently acquainted with the English language to derive the full benefit of the information contained in these publications,

Therefore be it resolved that this Convention of the Farmers and Dairymen of New Brunswick humbly submit for the serious consideration of the Honorable Minister of Agriculture the advisability of and the practical benefits to be derived by printing the the Annual Report and other publications of this Department in the French Language.

Presented by A J. Doucette and J. E. DeGrasse.

Whereas the greatest need of the dairy industry in Canada at the present time is the economic production of milk, and as the greatest factor in the economic production of milk is the cow that can produce large quantities of milk and fat, it naturally follows that the greatest problem confronting the dairymen of Canada today is how to eliminate the unprofitable or low producing cows from the dairy herds.

It is generally admitted that the sire is the most important factor in building up a dairy herd, and also that better results can be obtained by using a properly bred purebred sire than

(Continued on page 738)

W. H. HUBBARD, Supt.

Co-Operative Dairying a Success

Editor Farmer:

Co-operative dairying has been the greatest boon to farming in Eastern Canada, particulary in far Eastern Prince Edward Island, and its inception dates back some 25 years. We were started right in one respect at least, in that all cheese and butter factories paid for milk on the fat basis as shown by the Babcock test. And while this test has proven to be accurate beyond question, from the varied nature of the measurments of samples necessary in its operation, it is worse than useless in the hands of a careless or lazy factory manger, and is often the cause of great suspicion and dissatisfaction among the patrons of such an organization. I will not attempt to deny that patrons of cheese factories have not often grave reason to be suspicious that they may not be receiving justice in their "test" but if so the fault is in the careless operation not in the accuracy of the Babcock test, as is often claimed and if you are certain as you should be of the honesty and integrity of your maker and your test goes down when you erpected it would go up, don't think there is no other reason for it, as the variation fat in milk is one of the perplexing problems to many dairymen and not that we are continually learning something new about.

I have kept individual records of my herd for fourteen years and made several R. O. P. records as well and tried to learn what condition caused the variation in the fat from month to month, and while I believe that the percentage of fat produced by any individual cannot long be affected by feed while the cow is in milk, the condition of flesh has a great deal to do with how a cow will test and whether the animal is gaining or losing weight. And we can to a considerable extent control the test of a cow by the amount of bodily fat we put on her when dry, during the first few months of the following lactation period; we all know that a healthy, pregnant cow will fatten most readily during the last six weeks or so of her pregnancy. Nature is storing fat and feed for the coming offspring. Anyone who has seen an old dairy cow dressed for beef will note the excessive amount of kidney and intestine fat to that found in the young steer or heifer and after a fleshy cow freshens she will for the time the surplus flesh is being reduced (or milked out in the bucket) test much higher than at any other period of her lactation, excepting perhaps the last few weeks before again going dry. And it is during the "flush" of her milk that the expert feeder can get in his fine work, and while I do not profess to be one, I have done considerable experimenting to learn how to handle my herd the entire year that they may yield the greatest net profit.

Feeding for the greatest possible production will seldom give us the most economical returns and we must endeavor to reach the happy medium in this respect. I have been often disappointed in the yearly returns from the different members of the herd, particularly in the percentage of fat in their milk from year to year, and I often think a buyer should be careful before either recommending or condemning a cow that is either decidedly fleshy or very thin when she freshens, as either condition will be pretty certain to produce milk of an abnormal percentage in fat.

I purchased a cow once nearly dry, put her in good condiition (quite fat) and her milk tested 4.3 and 4.2 fat for the two first months, gradually falling to 3.0 per cent. fat as she milked off. The next season she was milked up to near calving, had a very large calf, was thin at calving and her first months test was 3.0, then 2.9 fat. Had I not followed her through two years I would have had a poor idea of her real worth as a producer.

And this has always been my experience—unless we gave the cows two months rest and put them in good fleshy condition, they tested low for that year, or lower than what we might call their normal range, and when they were unusually fleshy their test would average higher for the first three or four months. I am convinced that the only way I at least, could regulate their test was in so far as I could increase or decrease their bodily fat.

I had three heifers running one season in R. O. P. test as ell as the cow testing association, in the latter samples are taken morning and night every ten days and a test made of this sample, the other from the milk of at least two consecutive days every six weeks. Two different men were doing the work and neither had any way of learning the other's results, and I was pleased to dnd that they came very near the same amount in the year, only one pound of fat difference in one heifer and 20 pounds in another. The third was a little more, I cannot recollect the exact amount, but they were close enough to show that the once in ten day average will be sufficinet for a man to know his own herd.

During the year's work of these three heifers I was interested in the way their fat varied from month to month and also how they seemed to always hold together. They were all in good condition starting in in November and during the early winter months tested a little higher than their yearly average. Until the months of June and July the grass was abundant and with the grain ration I kept giving them they started to increase in weight and gave us the lowest test of fat in the year. I was rather surprised to learn this, but during August when the grass was short and they noticably failed some in flesh, their test went up to a considerable extent and later in the year when they again, through better feeding, began to increase in weight, their test fell. Two of these were two years old with first calf and made 413 and 414 lbs. fat, or over 500 lbs. butter each in the year.

I have since that experience noticed tthat whenever a cow was losing hesh she tested high for her particulra range and lower when she was putting it on her back. This is only natural and we can use our best judgment in feeding to counteract as far as possible this characteristic in our dairy cows, and I think explains why some men cannot believe their cows are testing lower late in the season when they are being well fed and gaining in flesh. The trouble is they have been let go off their milk during mid summer and will not respond to better feeding excepting to put it on their backs. And in handling a dairy herd over the entire year to make the most net profit don't start with a greater number than you can feed properly. This is often the first mistake. The cows will not be in the best condition starting their year's work. Then be watchful and observant that no loss or acicdent happens at the time of calving. Our practice is to have the cows dry two months and in a condition of good flesh (fair beef) and feed only roots and bran 10 days before freshening and allow the cow to calve in her stall, as we have no other place as warm as their stable, and we must of all things prevent chills. At this time we endeavor to be with the cow and when the calf is born, remove it as quietly and quickly as possible, blanket the cow immediately (or generally before calving) and let her lie quietly, as I think that excitement as well as cold will cause the retention of afterbirth. Give only warm water to drink and if warm water is before them then cover it, as I take no chances of them getting a chill from any cause. Retention of afterbirth is both dangerous and costly and it is generally through poor management that it is brought about. If for any reason you suspect a cow may not clean, put hot salt on her back imediately and keep her quite warm. After it comes away feed lightly for the first few days, but if she comes to her appetite and her milk quickly don't starve her and lose too much flesh, as a good cow will draw on herself rather heavily at this time; and increase her feed slowly and gradually from day to day. A cow will consume more meal at six than three weeks after calving if handled right and don't be anxious if she is doing good work and increase too fast. Try to learn just how much meal she can handle to give you the most profit. It does not take long to weigh and it pays well. If she is fat at calving you can produce some cheap milk for the first two months after calving, as she will not require as much meal to do her best as a thin cow, and no two cows can just be handled like to get the most profit from feed consumed. Generally speaking farm feeds are light in protein and for this reason oil meal is almost the only feed I buy in any quantity and from my experience with the best milk feeds we can produce it is by far the cheapest milk food to buy. We aim to grow the crops that will give us the most milk per acre, and all of them that I have ever yet been able to produce can be more profitably fed with an addition of oil meal, but "milk" crops is another end of the work and cannot be treated in an article such as this. However, in summing up, I have found to my own satisfaction at least, that it always pays to keep cows pretty nearly up to their limit, milking ten months of the year. If we had the help and time to milk three times a day it would pay to do so with large producers, as I have always found that any cow giving up to 55 or 60 lbs. of milk at two milkings a day will increase about ten lbs. if milked three times without increasing their feed and

PEERLESS
PERFECTION
Canadian Farmers
are loyal to the colors; loyal to their citizenship; loyal to business enterprises of the Provinces; every patriotic appeal finds a ready response in a Canadian's heart.
We are Canadian manufacturers; we have been doing business in Canada for many years, making Canada's fence, and we are grateful for the patronage accorded us during these years from our Canadian friends.
Now is the time to stand by Canada's interests. We are doing our part to maintain a business regularity, and are manufacturing such a good line of fencing that it is worthy of special mention in connection with Canada's future relations to the nations of the world. Observe the illustration, and then ask yourself this question: "Is not a fence made of material good enough for such an important purpose—up hill and down hill work—the kind that should be used by every Canadian?" There is but one answer—Peerless.
Made of heavy Open Hearth steel galvanized wire with all the impurities taken out and all the strength and toughness left in. Every wire is crimped making the fence into one continuous spring. Top and bottom wires are extra heavy. Will not sag. Requires less posts than ordinary fence. That means a saving in real money. Absolutely guaranteed.
Don't buy a rod of fencing until you get our illustrated Catalog—describes our big line of farm, poultry and ornamental fencing—also Peerless farm gates.
Agencies almost everywhere. Agents wanted in all unassigned territory. Write tonight—save a day.

Against Express Rate Increases

Mr. W. A. McKay on Behalf of Nova Scotia Farmers Association Presents Cogent Reasons For Refusing Advance in Rates

Gentlemen:—

I was appointed at the Annual Convention of the Nova Scotia Farmers Association, held in Truro, March 12-14 and by the Dairymen's Association of Nova Scotia, to present their claims to you relative to the Proposed Increased Express Rates.

Relative to Farmers Association

1. No definite data can be prepared without extensive investigation as to what effect the proposed increased rates will have on the farming community.

The Consensus of Opinion Seems to be

2. That if the Express Companies cannot do a reasonabel profitable business on the present basis, then they are entitled to an increase to make it reasonably profitable.

The Objections are

3. That the reports that are submitted by the Express Companies are apparently not giving a correct statement of their business and the opinion is that some items are withheld that if given would show the Companies to be on a paying basis.

4. That if an increase was required that it should have been done while prices of farm commodities were on the increase and not now when there is an apparent lowering of market.

5. That a greatly increased rate will be detrimental to the production of Pork, Veal, Lamb, Eggs, Poultry, Small fruits and Vegetables and other perishable farm products that have a limited market value and in Nova Scotia have to be shipped a long way to market.

6. That the Express service is overtaxed and if the rates are raised that the Companies be compelled to give a quicker and more efficient service.

The Dairymen's Association of Nova Scotia submit:

1. A sanction of paragraphs 2 to 6 above submitted.

2. The Creameries of Nova Scotia paid to the Express Companies as per statement attached $12,262.24 (Illus-No. 1).

3. The present rates in existence are detrimental to the development of Dairy work and no effort was made to use the Express Companies on that account.

4. The proposed increased rates will completely bar the shipping of Buttermilk and other By Products. This will practically result in the cutting off of the supply of Buttermilk to Sydney and adjacent towns and cities. (Illus. No. 2)

5. The proposed increased rates on cream shipments is 109%. The cream received in Nova Scotia is mostly received in 2½ and 4 gallon cans. The lowest rating is for 5 gallon cans, 2½ gallon cans would thus be increased another 100%. This is prohibitive, we petition for a rating for 2½ and 4 gallon cans.

6. The present rate has made it prohibitive to ship cream to the Government Creamery at Baddeck by Express and consequently no effort at increased production could be made on the main line of Railway and compete successfully with the more favourably situated creameries. This is also true in many other sections of the Province.

7. The proposed increased rates will put creameries having to receive their cream by Express in a very detrimental position (if not put them out of business) as compared to creameries that can receive their cream by Freight. Illustration No. 3.

8. The average Creamery in Nova Scotia manufactures butter for about 3 cents per pound (Cream delivered at the Creamery). This includes labour, plant, interest and all working expenses. Illustration No. 3 shows that the Express Companies will demand 4.18 cents per pound for carrying the cream between the different railway stations. We believe this to be too wide a division of payment for the respective services performed.

Final—As representing

The Farmers Association and The Dairymen's Association. The above is what I believe to be a clear presentation of the case from their standpoint and on their behalf I trust will receive due consideration.

Respectfully submitted,
W. A. MacKAY.

Illustration No. 2

The Intercolonial Creamery Co., South River Station, operate a store in Sydney for the sale of Buttermilk, Cream, etc. This is a distance between 100 and 150 miles. Buttermilk is shipped in 8 gallon cans at 41 cents returning emptys—46 cents for 32 quarts or 1.43 cents per quart. Proposed rate 85 cents returning empty, 26 lbs. at 42½ cents—11 cents—Total 96 cents or 3 cents per quart.

This will more than offset any profits that the store made and the Manager advises that they will be compelled to close up.

Illustration No. 2 A

Buttermilk has a food value as compared with other foods equal to about 60 cents per cwt.

The farmer usually receives for his buttermilk one cent per quart and is satisfied.

The Exphess Company is asking 3 cents per quart to transport this 100 miles or three times what the farmer received for his efforts.

We maintain this to be unfair.

Illustration No. 3

Comparison between A. Creamery Co. and B. Creamery Co. in 1918. A. receiving cream by Express and B. Creamery Co. receiving cream by Freight.

A. Creamery Co.

Made.....214.012 lbs. butter
75% received by Express..160,509 lbs.
Express paid on cream.....$3602.13
Cost per pound Butter.....2.18 cents

B. Creamery Co.

Made.....388,621 lbs. butter
60% by Freight.....233.167
Freight paid on cream.....$1888.81
Cost per pound butter.....81 cents

Difference 1.31 cents per pound.

Difference under proposed rates:

A.....4.18 cents
B..... .81 cents

Difference.....3.37 cents

The A Creamery Company Ltd

Manufactured in 1918 214,012 lbs butter
Received for mfg. at 4c.....$8560.48
Paid for Express..... 3911.25

Left for other expenses..... 4649.23
Increase of 109% would mean. 4263.26

Left for other expenses..... 385.97

Profits for Company in 1918 were $1200 from all sources and not allowing for interest on Capital Account of $8000. This increase would wipe out all profits and $3063.26 besides, or would represent an increased cost of manufacturing the butter of practically two cents per pound, which would be prohibitive in this case.

Results B.

Farms in the radius covered by the A Creamery have increased in value on an average of over 100% in 6 years. One farm sold in 1909 for $1200, was sold in 1916 for $4000. Improved in meantime $600.

A confidence in farming exists among the people. Contentment on the farm prevails. A greater interest in farm life. A desire to improve the cows and individual herds show increase of over 100% per cow in 8 years.

The Deering Manure Spreader Light Draft — Wide Spread

A LOAD of stable manure is no light weight. Matted with bedding and litter, it is no easy job to tear it into small pieces for the kind of spreading that good farmers demand. Yet two horses can handle easily the 49-bushel load of a **Deering** No. 8 in all ordinary going, and will get the load off in a good even coat in three to four minutes. With its light weight, roller bearings, and beater parts kept in line by a strong steel frame, the **Deering** is a very light draft machine.

The work of tearing up the manure is divided between two beaters, one of which is a spiral that makes this **Deering** spreader a wonderfully efficient fertilizing machine. It spreads beyond the wheel tracks. It covers the ground evenly clear across the width of the spread.

Three sizes of **Deering** spreaders give each farmer a machine suitable for his farm — No. 8, 49 bushels; No. 5, 55 bushels; No. 6, 63 bushels capacity. See the local dealer or write the nearest branch house for illustrated catalogue showing all the good features of this **Deering** light draft, wide-spread manure spreader.

APPLE SPRAYING IN 1919

(Contnued from page 707)

win and many other tsandard varieties, you wanted to know that there was a spray that would not do this and at same time be more efficient as a fungicide than lime sulphur. You did not want a spray with the defects of the old 4-4-40 Bordeaux which would russet your fruit and in most seasons give you serious leaf yellowing and defoliation. You wanted a spraying programme that would enable you to **control insect pests and fungous diseases, that would not reduce the crop, that would not russet the fruit and would not injure the foliage.** I think that our 1919 spray calendar will meet your requirements as a liquid spraying program. There may be some improvements possible in the details, but in the main I think it is about right. I must remind you here that in our work in these important problems we have based our conclusions on repeated experiments and have not allowed preconceived and often erroneous ideas to influence our deductions.

There are two insect pests that are this year epidemic in the Valley and which are worth reminding you of. One of these is the canker worm—where canker worms are present it is advisable to use 6 lbs. paste arsenate lead or 3 lbs. dry arsenate lead to 40 gals. of water immediately before the bolssoms open in place of the regular formula. To this one should add 5 lbs. hydrated lime to 40 gals. in order to eliminate yellowing. During the season of 1918 we again tested the value of 6 lbs. paste arsenate lead to 40 gals. of water as a fungicide and found, as we found the previous year, that it wa ssuperior to both lime sulphur and soluble sulphur in standard strengths, as a fungicide.

Many orchards in the Valley are now seriously infested with Tussock Moth, which did a great deal of damage in 1918 by nobbling the fruit, causing rregular and unsightly scars on the picked apples. Where ttey are present the above formula of 6 lbs. paste lead arsenate and 5 lbs. hydrated lime to 40 gals. water, should be used in place of the regular formula for the third or calyx spray. If the insect has passed unnoticed until after the third spray has been applied, apply this formula as soon as you notice the insect. We have tried various combinations of arsenicals and fungicides for these two insects with varying degrees of success and at last have decided that it is more economical and safest to use the over strength arsenate of lead formula with lime and to use no fungicide.

Last year, through the United Fruit Companies, we were instrumental in having a ton of finely pulverized copper sulphate purchased for your use in trying out the new method of making Bordeaux rapidly. On account of the excessive cost of this material in America, they have been unable to secure a supply for 1919. In normal times we can secure bluestone from England more cheaply than from American points. We have recently succeeded in locating firms in England who make a particularly fine grade of finely pulverized bluestone for Holland and France in thousands of tons annually, and at an average cost of less than one cent per pound over the crystal, so as soon as condtiions become normal we will be able to secure finely pulverized copper sulphate at a price that will make it profitable for all to use it.

A most urgent matter in the Valley at the present time is the scarcity of domestic bees as well as wild flower visiting insects. As some of you realise the past two winters have almost exterminated the domestic bee in many sections of the Annapolis Valley. Wtih an average bloom in ordinary weather, we have in the past not suffered greatly for want of bees, for we have had some domestic bees and some wild insects pollinating our fruit. With the prospect of a large bloom this year and most of our domestic bees killed and wild flower visiting insects apparently less numerous than in former years, the prospect now is that we will have a great deal of imperfect pollination and a consequent poor set of apples in 1919, if the situation is not remedied. It has been observed and demonstrated many times that No. 1 apples contain more seeds than No. 2's, and No. 2's more than No. 3's, etc. The size of the apple depends more on the number of carpels containing seeds or on the number of pistils pollinated than on any other single factor. Further, we know that in order for our fruit to set, it is necessary for an insect to carry pollen from one blossom to another at the right time and for some of the seed cells to be fertilized. If only one cell is fertilized, the apple will remain on the tree for upwards of a month, and will be shed from the tree in what is known as the "June" drop which normally occurs in Nova Scotia in the early part of July. If 2 cells are fertilized or contain seeds, the apple has a small chance of remaining on the the tree, but will seldom grow larger than a No. 3. With 3 or more cells fertilized, the apple has a good chance to remain on the tree; the size or grade it will attain depending largely on the number of cells fertilized.

It has lately been demonstrated by Mr. A. J. Heinicks in Bulletin 393 of the Cornell Experiment Station that the vigour of the fruit spur is the determining factor in the number of fertilized cells necessary to cause an apple to remain on the trees and also on the size of the fruit resulting. This is a most reasonable deduction which is amply demonstrated by Mr. Heinicks.

If bees are scarce in the locality therefore, a man has two alternatives if he wishes to insure a set of apples. The first and infinitely the best is to get bees and place them so that they can cover his orchard at blossoming time. The second alternative, a makeshift, if one cannot by any means secure bees, is to make your trees so vigorous at blossoming time that the apples which are imperfectly fertilized, will set better and grow larger than they otherwise would. In other words, by invigorating the tree, make a blossom with only 3 cells fertilized set as surely and grow as large an apple as would otherwise result from a blossom with 4 cells fertilized. How best to stimulate the trees is only partially a question for me to answer. Spraying, as we have recommended before the blossoms will prevent insect and fungous injury and so, in a manner, stimulate the trees. The avoiding of lime sulphur, which as explained in detail to you last year, is apt to cause dropping of the fruit through its action in injuring the chlorophyll and with faulty pollination its action in causing dropping would naturally be more severe, is another means of offsetting our lack of bees.

A second means of avoiding the results of faulty pollination, lies in the avoiding of lime sulphur as a spray, partcularly as a last or fourth spray. As I explained to you last year in detail, the injury from lime sulphur lies in its effect on the chlorophyll and resembles, and may be a starving process caused by the manufacture of food being reduced through the destruction of a portion of the chlorophyll. We can easily see how the dropping, caused by faulty pollination, would be increased by the use of lime sulphur as a spray and vice versa.

Another aid would be a dressing of some quick action fertilizer as nitrate of soda applied about the time the buds are beginning to swell. How much fertilizer to use, or how and when to apply it, I am leaving to your advisers on fertilizers. However, since domestic bees and wild insects are now very scarce in the Valley, and it is improbable that any appreciable number of you can supply yourselves with bees before first of next June, and, further, it is now apparent that we will have a heavy bloom next spring, which, from present indications may result in much imperfect pollination; it would seem best for those of you who are unable to supply yourselves with bees to take steps towards stimulating the vigour of your trees before blossoming season this spring.

Allow me to thank you for the assistance and co-operation that you have extended to us in our work during the past season.

One pound does the work of two of Paris Green, and does it better. It's first cost is far less than Paris Green. WATSON'S SOLUBLE ARSENOID is now recognized to be far the most efficient insecticide for killing potato bugs and other leaf eating insects.

It must be used with bordeaux mixture, and not otherwise. It is very adhesive and does not wash off easily.

FREE OF DUTY except the war tax.

On July 22, 1918, the Canadian Customs at Ottawa issued an order removing the duty on WATSON'S SOLUBLE ARSENOID except the war tax, and this order applies only to WATSON'S SOLUBLE ARSENOID, manufactured by John Watson and Company, Houlton, Maine. This endorsement speaks for itself.

WATSON'S SOLUBLE ARSENOID has been on the market for a number of years and is used almost exclusively in Aroostook County. If your dealer cannot supply you, write us direct, and give us the name of your dealer.

"Seeds with a Pedigree"

McDonald's Tested Seeds give maximum productiveness for the land, labor and money that is used to cultivate them. They are "seeds with a pedigree"—selected strains, chosen for yield and vigor, and especially adapted to climatic conditions of Canada.

Orders come to us from all sections of Canada because Farmers and Gardeners know they can "bank upon" McDonald's Tested Seeds for inherent crop-producing quality.

McDonald's TESTED SEEDS TRUE-VIGOROUS-RELIABLE

McDonald's Seed Book is now ready. Sent free on request

The following three sorts, selected from hundreds of varieties fully described in our Seed Book, will enable you to prove that quality is more important than price.

	pkt.	oz.	¼lb.	lb.
BEET—Early Wonder	10c.	25c.	75c.	$2.50
CARROT—New Amsterdam	10c.	35c.	$1.00	$3.75

THE PROVINCIAL SEED EXHIBITION

The Annual Provincial Seed Exhibition was held in the Drill Hall of the Normal School on Thursday, March 13th. The number of exhibits displayed in the sections for wheat and oats was greater than has been seen for several years. The various kinds of garden seeds were not so well represented as last year.

There were fifty exhibits of wheat and fifty-five of oats. The Sweepstake prize of $10.00 for the best bushel of wheat was won by Mr. E. Lorne Hume, Florenceville. An excellent sample of Marquis wheat was shown by Mr. R. A. Snowball, Chatham. In the classes for oats, Mr. John Stevenson, Gladwyn, carried off two first prizes and one second. He exhibited the best bushel of oats at the Fair. In the special classes open only to members of the Canadian Seed Growers Association, Mr. Hume won first in wheat and oats and third in potatoes. Mr. Donald Innis won a second in wheat. Mr. Wm. Palmer second in oats. Mr. Harvey Parlee, Sussex, second in potatoes.

A sample of the best wheat, oats and barley exhibited at the Fair will be placed on exhibition at the Provincial Immigration offices, St. John.

The York County Seed Grower's held their second Seed Fair in conjunction with the Provincia lFair. For some years the York County growers had felt that the competition of the whole Province discriminated unjustly against them, as the same strong competition was not felt by other counties as each of these conducted a county Seed Fair for the growers within its own boundaries. The exhibits shown by the York County members did credit to their reputation as seed growers. In the class for potatoes of the Green Mountain type, Mr. Wm. Palmer won with a sample hat won first prize in the open competition for the Province in which there were 15 exhibits.

The attractive booth of the Dominion Experimental Farm occupied one side of the Drill Hall. The display consisted of the different varieties of potatoes, and grains most suited to the Province.

The judges were: Messrs. E. P. Bradt, Secretary for Agriculture; E. M. Taylor; Jas. Bremner, Jr. and O. C. Hicks of the Provincial Department of Agriculture. The winners in the various classes are as follows:—

Wheat (White Fife)—1st, E. Lorne Hume, Florenceville; 2nd, W. E. Wallace, Penobsquis; 3rd, Donald Innis, Tobique River; 4th, N. F. Phillips, Pembroke; 5th, Thos. Stewart, Florenceville; 6th, Henry Gordon, Chatham; 7th, Stanley R. Roy, Elm Tree.

Wheat (White Russian)—1st, Henry Gordon, Chatham; 2nd, H. B. Parlee, Sussex; 3rd, T. A. Goggin, Elgin; 4th, J. & W. Brait, Rexton; 5th, Hypolite Daigle, St. Charles; 6th, W. E. B. Tait, Dorchester.

Wheat (Red Fife)—1st, Wm. Sauntry, Millerton; 2nd, Henry Gordon, Chatham; 3rd, W. H. Venning, Sussex; 4th, F. A. Burpee, Oromocto; 5th, C. C. West, Hopewell Hill; 6th, M. J. Hickey, Rexton; 7th, A. T. Reid, Rollingdam.

Wheat (Any other variety)—1st, R. A. Snowball, Chatham; 2nd, W. H. Venning, Sussex; 3rd, H. B. Parlee, Sussex; 4th, W. B. Tamlyn, Sussex; 5th, A. J. Marr, Sussex; Sixth, J. W. Stevenson, Gladwyn; 7th, Henry Nichol, Robertville.

Wheat (Sweepstakes)—1st, E. Lorne Hume, Florenceville; 2nd, H. B. Parlee, Sussex.

Oats (Banner)—1st, J. W. Stevenson, Gladwyn; 2nd, Thos. Stevenson; 3rd, W. H. Venning, Sussex; 4th, Henry Gordon, Chatham; 5th, Robt. J. Shaw, New Maryland; 6th, Wm. Palmer, Keswick; 7th, John Inch, Burtts Corner; 8th, A. T. Reed, Rollingdam; 9th, F. J. Smith, Hopewell Hill.

Oats (A.O.V.)—1st, Thos. Stevenson, Gladwyn; 2nd, J. W. Stevenson, Gladwyn; 3rd, W. H. Venning, Sussex; 4th, Lorne Hume, Florenceville; 5th, N. F. Phillips, Pembroke; 6th, Henry Gordon, Chatham; 7th, Basl Kilpatrick, Florenceville; 8th, R. J. Shaw, New Maryland; 9th, John B. Nichol, Robertville.

Oats (Black)—1st, A. J. Marr, Sussex; 2nd, Frank Thibideau, Rogersville.

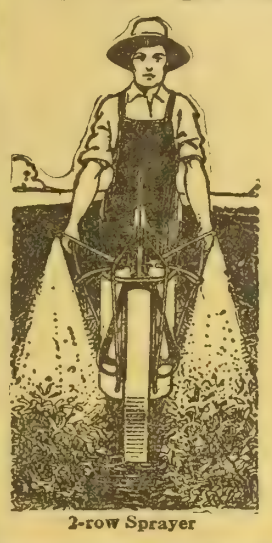
Oats (Sweepstakes)—1st, J. W. Stevenson, Gladwyn; 2nd, N. J. Phillips, Pembroke.

See that curve?

THAT curve in the lance of the O-K-Spra takes the place of the *curve in your back* that you have when you are using an ordinary sprayer to get under the leaves. That curve enables you to reach the most out-of-the-way spots.

On the tip of the curve is our "efficiency" non-clog nozzle with strainer shaped like a soldier's steel helmet, so that the particles fly off instead of clogging; needs fewer cleanings than any other nozzle. If you want the most effective, easiest to handle, surest and quickest sprayer of all get an

O-K-SPRA



2-row Sprayer

The O-K Canadian Two-Row Sprayer

is easily pushed by hand like a wheelbarrow and effectively sprays two rows at a time, adjustable for both width and height of rows; solution is kept stirred; the discharge pipe may be detached for white-washing, spraying trees, cleaning buggy or motor car, etc. Sturdily built for long service.

Get a sprayer NOW or you may "put off" securing it when your busy time comes. It may save you many times its cost. Should the bugs get ahead of you, think of your losses! Use it as a blight preventative too, and for spraying trees.

Write for literature giving full particulars of these, and also 4-row sprayers, with valuable information about mixing spraying materials.

WHAT STRAWBERRIES SHALL WE PLANT, AND WHY

(Experimental Farms Note.)

Strawberries are grown either for home consumption or for market. While those grown for market should be as good as those grown for home use, the fact is that in some cases those produced for market are grown more because of their productiveness and shipping qauilty than because of their flavor and general palatibility.

The most popular variety, taking the whole of Canada, is undoubtedly the Senator Dunlap. This is a very hardy variety, and the fruit is handsome in apearance, good in quality, and is an excelent variety for canning. It is desirable both for home use and market. Like all varieties, it has some faults, the chief one being that on acocunt of its making such a large number of plants the fruit begins to get small too early in the season in parts of Canada where dry, hot weather often occurs during the fruiting season; hence, where there are such conditions some other sort is desirable, and in the—Parsons Beauty and Glen Mary there are two commercial varieties which are succeeding very well in many places in Canada, especially in Eastern Canada. These are both large varieties and keep their size well to the end of the season. The Parsons Beauty is better in quality than Glen Mary and the latter is not very desirable for home use, but both should be tried to determine which succeeds best in the particular locality and soil where they are grown. The Williams is a firm berry, which is a very popular commercial sort in Western Ontario but it is not very popular in most other parts of Canada. It has a white tip which increases its shipping qualities but lessens its value when it is to be eaten raw. Splendid is a rather early variety which has made a good record in Eastern Canada, and Beder Wood is also another reliablee sort. The Marshall is one of the best in quality but must be grown under high cultivation in Eastern Canada to get fair crops and it not now much grown on account of its light cropping, but on the lower mainland of British Columbia it does well and is one of the best commercial varieties there. The Magoon is also a commercial variety which is also grown mainly in British Columbia.

The foregoing are the leading commercial varieties in Canada although to these might be added Sample, Pocomoke and Warfield as succeeding very well in some places. For the Prairies, a variety called Dakota, rather small in fruit but very hardy, has proved one of the most reliable, though Senator Dunlap also does well if well cared for.

The best varieties for home use in Eastern Canada are Senator Dunlap, Bubash, Parsons Beauty and Wm. Belt, the latter and the Bubach being large varieties of good quality. In British Columbia the Royal Sovereign Paxton, and Marshall are three of the best for home use. The two former English varieties not satisfactory except in the mildest sections of the Domniion. The Everbearing strawberries are partirularly desirable for home use, and two of the best of these are Progressive and Americus.

Bush fruits of all kinds should be staked, thoroughly worked and then should receive a heavy mulch of coarse barnyard manure, which serves the double purpose of keeping them from drying out and keeping up the necessary fertility. A light dressing of wood ashes before applying the mulch is quite beneficial on most soils. Keep a sharp lookout for mice in the litter.

Note Pump is Outside of Barrel

Don't Run a Hatchery
For Bugs and Diseases

DON'T be satisfied to take as *your* share of the crops only just what luck has saved for you after the bugs and diseases have had all they want!

Don't let bugs and diseases get away with your profits because you do not spray, or because the sprayer you use fails to do a *real* job.

IRON AGE

Barrel, Traction and Power Sprayers
Made in Canada

The secret of *right* spraying is a constant heavy pressure that drives the poison fog in and around every twig and leaf. This pressure is absolutely dependent upon the pump—the heart of the sprayer outfit.

Iron Age Sprayers—Barrel, Traction or Power—are equipped with dependable pumps that will always deliver the spray under *high pressure.* They have *rust-proof* ball valves that do not leak or get out of order. And the pumps are always on the *outside*—easy to get at and clean.

Iron Age BARREL Sprayers are furnished with either double or single action pumps and can be used in any wagon, cart or sled. *Iron Age TRACTION Sprayers* derive their power from the wheels and cover six to ten rows. With the orchard attachments they will spray orchards and vineyards as well as row crops.

Iron Age Sprayers, with their high pressure, reduce wastage of spraying solution and make spraying costs insignificant compared with the increase in quality and quantity of crops.

DAIRYING.

FOUNDING A HERD OF PURE BRED DAIRY CATTLE ON A LIMITED CAPITAL

Every ambitious farmer, who is worthy of the name, has sooner or later to wrestle with the question of making a start along some line of purebred stock, or else fall back into the rear ranks of his profession.

The way in which this problem is to be tackled will be governed almost entirely by two factors, namely the amount of capital which the farmer feels he can put in the enterprise, and the type of stock he desires to make a specialty of.

For the sake of argument, let us consider the case of a man, who wishes to lay the foundations of a herd of one of the breeds of dairy cattle. To the farmer, who, at the outset, is in a position to make a considerable outlay, for the purchase of foundation stock of the right calibre, the road seems comparatively short and easy. Provided that he makes a reasonably good selection of animals in his first purchases, and follows this up with careful feeding and breeding, he can reasonably expect, in the course of a very few years, to develop a herd, which will approach somewhere near the standard of quality he had in mind at the outset. So much for the man who can start out with a flourish.

But, however, when a farmer has only a very limited amout of capital to spend in the purchase of foundation stock, the problem of founding a herd of purebred dairy cattle takes on a different appearance entirely. He has probably given the proposition enough thought to know that the sum he has at his disposal is only sufficient to purchase one or two animals of such quality as he would desire to have as the cornerstones of his herd. The price of such animals as he would need, sounds pretty steep in terms of hard cold cash—sufficient probably to purchase half a dozen animals of the type he has been accustomed to doing business with. Then, too, the possibility of running into bad luck with his one or two foundation animals, looms up rather large in his calculations, and if that should happen, the purebred game would be "all off" so far as he was concerned. Summing it all up, he is just as likely as not to come to the conclusion that under the best of conditions, it looks like a "long, long trail" from a start with one or two individuals to a herd in size, and quality the equal of the well known herds he has in mind, and which have perhaps been responsible for turning his thoughts along the lines of better stock.

To any person who is just at this "yes or no" stage, it might be of help to point out that a very large proportion of the finest herds in the country, among them some om the very herds which have aroused his envy, have started from just such small beginnings, as he would be obliged to make —or perhaps even smaller—and have been developed along the very lines, which appear to him too long a road to travel.

"Rome wasn't built in a day," neither can a prime herd be gotten together on short notice. On the contrary, it is a process which requires a solid foundation, however small, to be followed by careful selection, the weeding out of all failures, breeding so as to "fix" desirable qualities and, eliminate so far as possible the weak points, and last, but not least, a careful study of the individual animals, to ascertain the conditions under which each does its best work.

As a good example of how a first class herd has been developed from small beginnings, we have in mind a herd of Holstein cattle which ranks high in show and producing qualities, and is one of the pioneer Canadian herds. The foundations of this herd were laid some twenty odd years ago, by the purchase of three cows from one of the then prominent herds of New York State. One of these first three animals proved to be a poor investment, turning out to be a non-breeder.

After a few years breeding it was evident that one of the two remaining foundations cows was leaving progeny, which were showing more promise than were the descendents of the other, so it was decided that the herd should be based upon this one cow, and her progeny. That this policy was closely adhered to is well brought out by the fact, that at the present time out of the fifty odd animals comprising the herd, there are only three females which do not trace back, in ancestry, to the one cow. In the development of this particular herd, the ownre made a special point of using as herd sires, bulls, which were not only well bred, but which had in addition, quality and good individuality on a par with their breeding. Thiis is a feature which should be incorporated in the policy of every breeder, whether working on a large scale or a smal lone, if progress in the right direction is to be made.

What of the results gained through this method of breeding? From the point of view of production, in the particular herd used as an example, one cow held for a time the world's record for one day's milk production in the four year old class, viz., 116.4 lbs. of milk in 24 hours, while another cow in this herd has produced 32 lbs. of butter in 7 days; conclusive proof of the effectiveness of work along these lines. Does it seem reasonable in the face of facts like these to give up the idea of having better stock simply because of the necessity of starting in a small way?

DEFECTS IN FARM BUTTER

Good butter should be firm and waxlike in texture and rather slow to melt, a rich yellow—but not too yellow—in color, and with a delicate, appetizing lactic taste. Good butter is appreciated by every butter user, and we shall here give some o fthe troubles of the butter maker, with the remedies.

Sour Butter.—This comes from letting the cream get too sour before churning. A mild acid, a slight thickening of the cream, a smooth appearance and a consistence like fresh thin pancake batter, with the whole lot alike from top to bottom, is the kind of cream that insures good tasting butter, if the buttermilk is all removed after churning.

It is easier and better to wash out the buttermilk than to work it out. To do this draw off the buttermilk when the butted granules are the size of wheat, and fill the churn with water. Agitate this, draw off and repeat. Then work until solid.

Spongy White Butter.—This is caused by the failing most common—poor washing and working. The buttermilk s not all removed, and the fat granules are not solidified. Such butter will melt quickly, will get sour very soon, and in warm weather is not fit to eat forty-eight hours after churning.

Greasy Butter.—This is caused by churning too warm or working too much. The grain of the butter is spoiled and can never be regained. A thermometer will tell you how to avoid the first—churn at 52 degrees in summer and 55 to 57 degrees in the winter—but common sense and practice only will tell you how to avoid the second.

Bitter Flavor.—The diet is usually to blame for this fault. Eating raw weeds and other weeds of this sort or leaves from oak and beech trees will cause a bitter flavor.

In th winter a frequent cause. holding the cream at a low temperature too long. Cream or milk held a or near freezing point does not sour but becomes bitter. The acid-producing bacteria will not develop at a temperature below 58 degrees, although ther eare other bacteria which cause a bitter ferment that will propagate at a lower temperature.

White Lumps.—These are due clots of curd. They come from improper handling of cream. It ha

MORE MILK & BUTTER
HAS NO EQUAL AS A BUTTER AND MILK PRODUCER
Milch cows need food rich in nitrogen for two reasons, to rebuild the ordinary waste of tissue and to secure the protein necessary for the milk. This is why nothing can equal "Maple Leaf" Oil Cake as a Producer of butter and milk. It increases the flow of the milk and adds to the richness of the cream. Made by the old process and guaranteed absolutely pure. Contains over 35% protein and 33% Carbo Hydrates.
THIS splendid food is so rich in protein that British Farmers send four thousand miles to secure it.
Write to-day for samples and our free booklet "Facts to Feed"

EMPIRE
MILKING MACHINES

become too sour and "wheyed off." In other words, it is partly decomposed. The scum of the cream has partly settled to the bottom and the solids have gathered in clots. These clots hold together so strongly that churning will not break them up, so they appear in the butter unchurned. They are unsightly; they lower the price of the butter if sold and destrop the pleasure of eating it if used at home.

As a preventative, the cream should be well stirred when fresh cream is added to that already n the can; also stir when ripening so that all will ripen evenly.

There are small white grains sometimes found in butter made from separator cream. But these are not the lumps meant here. They are simply little lumps of butter that the separated and will not take color like the unchurned cream. A remedy for this is to set the cream separator so that it skims thiner or to skin slower.

Mottled Butter.—Salt deepens the yellow in butter. If the salting is uneven or not well worked in, the color will be uneven. Mottled but ter is common when the butter granules are too large, or too cold when the sal tis added, so that it does not dissolve evenly.

Streaked Butter.—This is another result of uneven salting, the difference being that the different layers have been differently salted. Insufficient working is the trouble. An even incorporation of the salt will prevent both mottles and streaks and the working must be efficient to secure this.

First, the cows may have been milked too long after calving. The butterfats become hard and tallowy as the cow approaches the end of her milking period. The best treatment of such milk is to heat it, which may may be done best by setting the milk vesel inside a larger one filled with boiling water. It should be warmed until the surface "crinkles."

Or it may come from feeding too much cottonseed meal or other hard fat forming feeds.

The third cause is trying to finish the butter when it is too cold. It must be warm enough to mould like wax. The remedy for this is to warm the last water in which it is to be washed to 62 degrees or thereabouts which wil lsoften it; then salt and as soon as the salt dissolves, finish the butter quickly.

Light Colored Butter.—This is common during the winter months, when the cows are denied fresh grass. The only remedy is to add a touch of color to such butter and work it in evenly. In our younger days this was considered a disgrace, and the woman who colored her butter was looked upon almost as though she colored her face. However, most of us have outgrown this old fogyism.—A. C. Palmer.

MONCTON CREAMERY'S SUCCESS

In the summer of 1917 the Department of Agriculture of the Province of New Brunswick looked into the matter of having a creamery established at Moncton. The Department felt that this section was admirably adapted to dairying yet this very important branch of agriculture was not nearly as much in evidence as it should be.

It was believed a large central creamery at Moncton would give a great stimulus to the dairy industry. Moncton being an important railway centre and the natural hub for the surrounding country it would be feasible to have cream shipped in from all parts of Westmorland, Albert and Kent counties. Moncton as well would provide an excellent market for all kinds of dairy products.

Consequently, after giving the matter thorough consideration, a series of meetings was held throughout all parts of the above mentioned counties, in October and November, where creameries or cheese factories were not in existence. These meetings were addressed by practical and experienced dairymen from all three of the Maritime Provinces. The whole proposition which the Department had in mind for organizing was outlined. It was proposed to organize a co-operative company, limited to the amount of stock subscribed, with an authorized capital of twenty-five thousand dollars, divided into one thousand shares of twenty-five dollars each and at present to offer about four hundred shares which number would be sufficient to equip an up-to-date creamery ready for operation.

On the whole, the proposition was looked upon with favor. At each meeting a committee was appointed to look further into the matter in its particular locality and of this committee two were to be appointed among themselves to attend a general meeting to b held in Moncton at a later date, due notice of which would be given.

At the general meeting held in Moncton Dec. 27, 1917, the whole matter was thoroughly gone into again and the delegates were unanimous in their belief that a co-operative creamery in Moncton would be a splendid institution and as a result "The Farmers' Co-operative Creamery Company, Ltd." was organized, a board of directors elected comprising Messrs. A. E. Trites, Salisbury; Simeon Melanson, Pre de Haut; Geo. Fawcett, Middle Sackville, in Westmorland Co.; Urbian Breau, St. Anthony, Isaie Melanson, Legerville, in Kent County; S. S. Ryan Coverdale and C. W. Colpitts, Colpitts Settlement in Albert County. At a meeting held later Mr. Trites elected president, Mr. Simeon Melanson vice-president and Mr. J. H. King temporary secretary until a permanent man could be engaged.

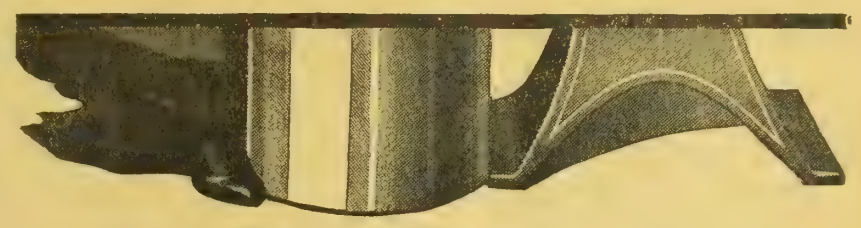
The directors got down to business at once, a building was purchased. Mr. J. P. Simonds, of Dunstaffnage, P.E.I., was engaged in February, 1918, as manager and secretary-treasurer, after which the purchased plant was thoroughly renovated and equipped with the most modern machinery and on June 5th the company began business in one of the most sanitary and up-to-date creameries in the Maritime Provinces.

It is but natural to suppose after the expenditure of much time and energy in connection with this movement on the part of those particularly interested that they did not get very far from the cream vats during the first few days. Many prophecies pro and con had been forecasted but so far the writer is aware none were optimisti cenough to foretell as much of an output from the creamery as act-

The Best Time to Buy a

DE LAVAL

CREAM SEPARATOR



THE best time to buy a De Laval is when you need it most. With cows freshened, or freshening soon, you will have more milk to handle.

And with butter-fat at present prices you can't afford to lose any of it.

If you are still skimming by the "gravity" method or if you are trying to get along with an inferior or "half-worn-out" separator, you certainly are losing a lot of valuable butter-fat.

So you see that the combination of larger milk supply and a high price for butter-fat can mean only one thing—you need the best separator to be had

Right Now

The best cream separator you can get is the only machine you can afford to use these days, and creamerymen, dairy authorities and the 2,325,000 DeLaval users all agree that the De Laval is the world's greatest cream saver. They know from experience that the De Laval is the most economical machine for them to use.

If you buy a De Laval you will get a machine that is tried and tested and true—a machine that will give you genuine service—and you will get the cleanest skimming, easiest turning, longest wearing cream separator that money can buy.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

ually resulted.

Below is a summary of the business of the Company for the year ending Decemer 31, 1918, taken from the Secretary-treasurer's report:

Number of patrons supplying cream	324
Total amount of butter manufactured	90,507 lbs.
Total cash paid patrons for cream	$37,735.45
Average monthly price paid for fat	51.42
Value of buttermilk sold	$1,925.04

The output last year was the second largest of any creamery in New Brunswick. This without doubt exceeds anything ever attempted in this province in the line of dairying.

It is predicted that the output for this year wil be at least half as much again and unless all signs fail and the unexpected happens this prophecy should be fulfilled.

The second annual meeting of the company was held in their building on Feb. 13th, 1919, at which considerable business of importance was transacted. The reports submitted by the various officers and the satisfaction given by the first board of Directors resulted in the full board being re-elected, the only alteration being Mr. R. A. Weldon's election to the board to represent the east end of Westmorland County in place of Mr. Geo. A. Fawcett, whose untimely death took place last July.

NEW BRUNSWICK'S OPPORTUNITY TO GET AWAY FROM SCRUB BULLS

The scrub bull problem has long been before the public and has never as yet been satisfactoryily solved. Legislation on the subject has been suggested but it has been feared that this would be considered as an infringment on the personal liberties of the individual. Now, however the Federal Department of Agriculture (Live Stock Branch) in co-operation with the Provincial Department of Agriculture is offering assistance which we fully believe, if taken advantage of will solve the scrub bull question as the assistance granted is especially directed towards districts in which scrubs are kept.

Briefly, under this scheme in which the Federal and Provincial Departments are co-operating a pure bred bull is offered free of cost for the use of farmers in sparsely settled districts, in new districts, and in districts where advancement in stock improvement has been slow—also in districts where the farmers are unfamiliar with the benefits following the use of a pure bred sire. To secure a bull under these terms it is necessary to have an Association of at least ten farmers who must be unanimous in regard to the breed of bull desired. It must be fully understood that we do not want to interfere with private enterprise in the matter of placing these bulls, e. g., if a farmer in the midst of a proposed Association has a good pure bred bull of his own for the use of the farmers in that vicinity then it would be useless placing a Federal bull in that district. Also some one member of the Association must be prepared to take proper care of the bull to the satisfaction of the Federal representative who will inspect the bull from time to time.

To protect our local breeders representation has been made to the Ottawa authorities asking that whenever possible if good bulls can be found in the province they should be purchased. The Ottawa authorities recognize the justice of this claim and state that whenever possible, if satisfactory bulls can be secured from local sources, these will be utilized.

Th eHon. J. F. Tweeddale has expressed the opinion that this is too good an opportunity for the farmers of the Province to let pass and he desires that the farmers take the fullest advantage of it, hoping that at least four or five good pure bred bulls can be placed in each of the fifteen counties of the Province. Farmers interested in this proposition should communicate with the Provincial Department of Agriculture. A representative of the Department will be sent to help organize an Association.

Plan to secure the service of a good pure bred bull. Remember this is our opportunity to get away from the scrub bull.

"Let us take advantage of it."

N. B. Live Stock Supt.

WHAT IT COSTS TO RAISE A COW

(American Agriculturist)

Raising calves to cowhood is both a ticklish and a costly business. Many people do not think so—until they have tried. City customers have a feeling that calves, like Topsy, just grew; and that they look after themselves, causing the owner no care and little if any cost. The pity of it is, many farmers are of the same opinion. They are—until they keep a record of the food consumed and the labor entailed; then their eyes open to the fact that calves cost money, just the same as gasoline, or farm tools, or taxes.

Dairymen are under great obligation to the splendid exhibit of the New York state agricultural college at the milk exposition in New York city last May, when the college showed what it actually costs to raise a calf up to the time it givess its first milk. That exhibit itself was worth the cost of the entire exhibition. It was graphic—it told the story, not in senseless charts, not in columns of figures, not in ficititious diagrams, but in milk cans, in a real silo, in real bales of hay, and in real sacks of grain.

Its reality was there. And no man who had sense of values or sense of cold money could fail in his flair of the meaning. He located the costs of raising a calf. He knew that cows came as a result of labor, food, expenditures, not from free air water and talk. The college therefore, in presenting the exhibit, did a service that for all time to come will be of benefit to dairy interests.

Facts are as Plain as Day

These costs, mind you, are not what somebody imagines them to be; they are the real facts, taken from the calf pens, where food and labor are recorded, and they reveal 106 cold dollars expended as the cost of raising the average calf of New York up to cowhood. And these dollars, expended in getting a cow, are entitled to

SELL YOUR MILK

At the Same Time Raise Your Calves

THE use of Grofast Calf Meal will enable you to sell all your milk and raise your calves at a big profit. It is a scientific substitute for milk, easily mixed and calves thrive on it rapidly. Equally as satisfactory as whole milk at a fraction of the cost.

Sold by dealers in practically every town and village throughout Quebec, in 25, 50 and 100 lb. bags on a money back guarantee. Get a bag from your dealer and try it. The results will surprise you.

consideration when she becomes a cow.

But the daiyman—does he take them into accont? Does the average dairyman ever figure that cow investment in his milk costs? Suppose there are 20 cows in a herd, these are 20 times $106, or $2,110. That investment is worth 6 per cent. interest annually, plus a regular depreciation. In ten years each one of those 10 cows will be useless or dead, and the original $2,100 will be gone. Of course there may be 20 other cows to replace them, but the new 20 cows will involve another expenditure of like size as the first. No, you cannot get away from it—unless the milk these cows yield brings in enough cash to meet regular feed and labor bills and amortize or wipe out the original investment or cost, the owner has lost that original $2,110, or such a part of it as is not covered in annual milk receipts.

There are still other factors. Besides original investment in cows there are investments in building, land, tools, implements and current expenses for taxes, labor and feed. When figuring milk costs, before any items are put down as involved in such costs, first should be included these investment items in cows, buildings, land and implements. Ten per cent. of this sum shuold be set aside for depreciation; and in these days of high money rates another 6 per cent. for interest on the investment—a total of 16 per cent. to be chalked up as necessary to be met in determining what it costs to make milk. On top of these items now should come labor, feed, taxes and other items entering into the production of milk. Otherwise the producer is cheating himself, and is giving neither the family or the cows a square deal.

Cows Cost Money

We must get away from the old notion that because things are raised on a farm they cost nothing. They cost money in somebody's time. It may be the children who feed the calves, the women who help milk; but just the same the money value is in this human expenditure of effort, and this effort is entitled to reward just the same as if expended elsewhere, on the railroad, in the shop, in the town or in the city.

It costs $106 to raise a cow from calfhood to the period when she will supoprt herself. That's your money, Mr. Dairyman; you earned it, and plain business gives you the right to get enough out of the milk she yileds during her lifetime to pay that investment back, and all other costs of keep and care.

SHARP TEETH IN PIGS

I just want to tell you my experience I had with a sow. The sow had nine pigs, all very lively. The fourth day I counted them again and there were only eight young ones. I first thought one got out somewhere, but there was no place for any of them to get out, so I watched the sow until she laid down to nurse. Then I noticed the little fellows were fighting for the teats, and one teat was bleeding. All of a sudden the mother jumped up and snaped for one. Then I knew she had eaten one, so I clipped off those four wolf teeth on each side with a pair of nail clippers. After I had every one's teeth clipped off I put them all back with the mother, and had no more trouble. Those teeth are vrey sharp. I would advise every hogman to do this the second day after they are born.

Some peopleup my way give the sow a piece of salt pork in such a case, but that is nonsense. I had another sow farrow anad I have done the same thing, clipped the teeth off the second day; had no trouble with her at all. It happens more with large litters.—Herman Osmers.

INFLUENCE OF A PREVIOUS IMPREGNATION

J. M. Writes:—"If a registered mare, sow, cow or bitch is bred to a scrub will it require from one to three years of breeding to registered stock to produce an animal that can be registered?"

No. There is a theory, more general among breeders of dogs than breeders of othr classes of livestock, that a female once bred to a male of another breed or no particular breed at all, will not produce offspring true to the breed characteristics, when again bred to pure bred males of her own breed. The theory is held to some extent by breeders of livestock, but there is nothing to prevent the registering of pure-bred offspring from a female that has been bred previously to a male of another breed or of imupre breeding.

THE HORSE

CARE OF THE FOOT OF THE FOAL IS NECESSARY FOR FULL DEVELOPMENT

The care of the foot should begin with the foal. It can be noted that the foal's feet at birth are in a very undeveloped state, and the conditions that often prevail in the nursery stage in the box stall are not conducive to a good start for best conformation or growth of hoof. Up to recent tmes, it was considered that the foot of the youngster could look after itself and it received little or no attention until the animal was started to work at three years of age. It is during these three years that it is possible to cultivate a good foot, and to correct errors in conformation of the limbs, and not afterwards.

Training the Foot

At the age of six weeks to two months, the wall has often grown considerably beyond the level of the outer edge of the sole, and the heels have begun to grow deep and strong, which condition interferes with the elasticity of the part, removes the frog from the ground and allows of contraction. The heels of the young animal's foot, as can be seen from their direction, have a tendency to curl inwards, and if left alone may produce a contracted foot. The chief object is to get them to spring, and to slope nicely outwards. Early trimming will bring about what is desired.

Every foal should be carefully watched to guard against this hoof tendency. They should be led on to a cement or wooden floor to see how it is with their hoofs. The dirt floor does not give so clear evidence of the contracting hoof, or the expanding one, and the trimming can bes best guided on a smooth, hard floor. The same applies in shoeing older animals. Every blacksmith that does horse shoeing should have a wooden or cement floor for the purpose, so that a level and perfect fit can be attained.

Very little difficulty will be found in training the young colt to stand quietly while its hoof is being fixed. Kindness and a little firmness will win them every time, and there are few colts that will have good underpinning without a good deal of attention being paid to the growing of their hoofs.

How the Hoof is Shaped

The wall, that is, the lower outer ring of grown hoof that projects further down than the sole, should be cut down with a sharp drawing knife until it is level with the outer edge of the sole all the way round. The heels especially should be reduced until the bars and frog are pressing on the ground. The toe has a tendency to grow too long, which throws too much stress on the back tendons. It must therefore be shortened, but not too much, so as to produce a "stumped" condition, where the wall at the toe has been cut, and evaporation of the horn is allowed, to the detriment of the quality of the hoof. The unshod foot should be shod every month. It is absolutely prohibitive to cut the sole, frog, or bars, or to cut out a wedge-shaped piece, between the heel anad the frog, as some do, with th idea that it favors expansion. It has the opposite effect. The frog has nothing to press against. This is all the attention that is necessary for the full development of a good foot, in an animal with limbs absolutely straight and well formed, and which moves straight and close. Such young colts do not require to be shod. The unshod hoof grows more quickly than the shod.

Improving Defective Limbs

Unfortunately many foals are born with limbs far from being straight and perfect. They may be bent and distorted in various directions. The reaction of the distorted limb on the foot, and vice versa, is a serious matter in youngsters, where the tissues are soft and plastic and easily miulded to external conditions. It is often possible to improve defective limbs by early attention and shoeing.

Every attention should be paid to defects of the limbs and the remedies to apply for same. For instance, in a youngster that grows wide behind the outerside of the column of bones of the limb is longer than the inner, and hence causes the limb to bulge outwards. Greater pressure is exerted on the outer wall of the foot, which wears away, while the inner wall grows too long and soon the foot gets misshapen and twisted. Such a foot will prevent the limbs from assuming their natural direction, if, as time goes on, they had a tendency to di so. It is not advisable to shoe a foal much before weaning, therefore in such a case the inner wall should be cut down, the toe shortened, and the outer wall allowed to grow long. The inner side of the frog may also require to be lowered so as to allow the inner wall to come to the ground.

After weaning time all alterations should be on the shoe. A shoe should be applied very thin on the inner branch and around the toe, and thick at the outer quarter and heel, and a small calkin on the outer heel. The thickening of the outer edge of the

56 Wellington St. E., TORONTO.

shie should be gradual, as too much at first might cause a sprain. The calkin tends to stop the foot suddenly, thus shortening the step somewhat, with the result that the toe is turned outwards and the point of the hock has an inward tendency.

Provided a foal has a good coronet, and a good quality of horn, it is generally possible, with a little study, care and attention, to cultivate a foot which will carry the animal without trouble during its lifetime.

AN EIGHT-YEAR-OLD HORSE HAS QUITTOR

I have a horse eight years old, very free worker when alright, but periodically goes very lame, most often on the near fore foot, when I have to lay him off work for a few days. The leg swells up and there seems to be great pain around the coronet of the hoof, in fact anywhere on the hoof should it be touched. I have treated the foot with poultice with the result that hoof cracks open, and a vile smelling discharge comes from it. On cleaning out hte sole of the foot it is found to be almost decayed. This sort of thing goes on periodically and I can do nothing for it.

nAs.—Your horse suffers from Quittor, a very troublesome condition of horses feet, generall caused by some injury such as treading by his mate while turning in harness or a blow from a talling tongue. Owing to the dense and unyielding character of the tissues involved this is an extremely painful disease, and before the abcess breaks causes very severe lameness. The frequent recurrence of the trouble in the case of your horse indicates that the deep-seated strcutures are seriously affected constituting one of the worst forms of the disease and one in which an operation requiring the skill of a qualified veterinarian may be necessary to bring about a cure.

The pus must be given free vent by opening the foot at the sole and cutting away the hoof below the coronet. When a food drainage has been established the foot should be thoroughly cleaned and immersed for two or three hours in a solution of bichloride of mercury, 1 to 1,000, kept as hot as the hand can bear or poulticed with hot bran containing a liberal quantity of common salt. Good drainage having been established the openings must be thoroughly syringed two or three times a day with some antiseptic solution such as bichloride of mercury 1 to 800, or sugar of lead and sulphate of copper 1 ounce of each to a quart of water. In persistent cases better results are often secured by frequent changes from one form of antiseptic to another.

Serious cases of Quittor are always very troublesome and difficult to deal with, and if at all possible it would pay you to place your horse in the hands of a competent veterinarian.

CHRONIC SORE SHOULDERS

O. B., writes:—"Mare had sore shoulders last fall, but having rested all winter, sores are now healed and the hair grown over. There are several small lumps all down the face of the shoulders that, when touched, appears to be sore, and when worked it looks as though she were getting sore shoulders again. She is getting very little grain, runs out on pasture by day, and feed her oat straw at night. Would be glad to know the best thing to do to keep her shoulders sound and free from sores."

While the sores which affected the shoulders have healed, the skin and tissues over the parts have formed little sensitive lumps which remain tender. You might try bathing the shoulders every day with salt water and a little vinegar added. This should help to absorb the lumps a little and remove the tenderness. See that the collar fits properly and that the hames are properly adjusted to the collar. You might also try the use of sweat pads and, by raising and lowering the hames, change the draft to bear more evenly on other parts of the shoulder.

Horsemen Attention !

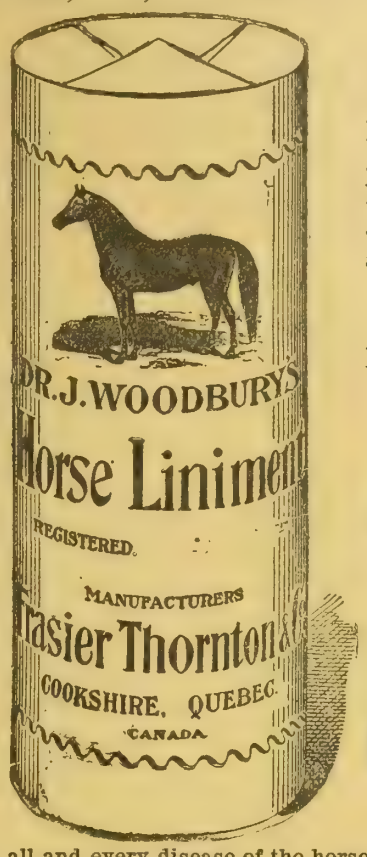
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

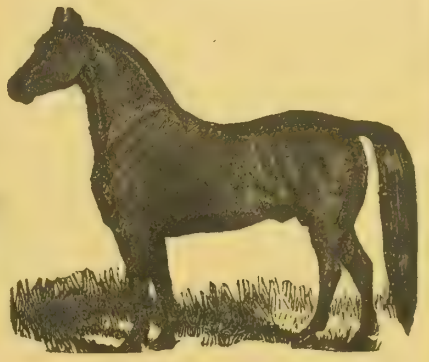
FOR SALE ALL DEALERS

PRICE 35 CENTS



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

DEMAND
DR. J. WOODBURY'S
HORSE LINIMENT



AFTER USING

Use this preparation thoroughly for all and every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and notice, its effects, and, honestly judging it on its merits, you will be compelled to endorse it.

USEFUL DEVICE IN HARNESSING HORSES

There are always a few words at the bottom of a farmer's vocabulary that should not be spoken out loud. Being "new" on a farm and in the handling of horses I found that these sacred words in my vocabulary were daily reached on the following account: The horses always wanted to eat when I wanted to put the collar on; by the time I got the harneess thrown over their backs the collar was over their ears. After several "rackets"' with them and after calling them names that they did not recognize as their own, I am positive, I could manage to get the hames buckled. Then the same experience took place at the other end of th harness—with the heads in the manger the crupper woudn't go under the tail so there it was again.

Since using my little device I am never vexed as before aind the horses think I am easier to get along with in general. A string and a piece of bent wire will answer the purpose, but I bought for three cents per foot about three feet of steel wire chain. On the bottom end I put a snap hook and the other end of the chain I stapled to the ceiling of the barn directly over the horse's head, making the chain just long enough to reach the side ring in the halter. I also put a staple at the side of the stall. When I get ready to harness I snap the chain in the halter, thus keeping the horse's head erect and in position to receive the full harness in the easiest possible manner. When ready to take the team out I simply unsnap the chain from the halter and snap in the staple at the side of the stall, out of the way until it is to be used again. For so simple a thing it is surprising the pleasure there is in using it. Many persons have remarked concerning its originality and of the benefits. —O. T. Welch.

LICE ON HORSES

I would like to get your advice as how to get rid of lice on horses. I have been advised to use Gillette's lye and sulphur.—J. E. C.

Reply. To allay the irritation of the skin and destroy the vermin on your horse nothing is better than a preparation made of one drachm calomel mixed with one ounce petroleum ointment. A handy and also effective mixture for the same purpose is found in one, made up of one part turpentine to three aprts olive oil Gillette's lye if put on too strong doses is apt to damage the skin and take out the hair.

ABCESS ON MARE'S UDDER

I have a mare from which the colt has been weaned. Though I milked her for eight or ten times after, her udder swelled up and is now running yelolw matter. What can I do for her?—E. W.

Reply.—Evidently there has been a collection of milk which has caused an abcess. Keep the abcess open and syringe the wound with a one per cent. solution of carbolic acid. The opening must be allowed to run freely. After washing out with the solution dress with an antiseptic made up as follows: Powdered sulphate of copper, 1 drachm, lard, 1 ounce, mixed together.

SETTING TIRES

Loose buggy or wagon tires may be set by a bath of hot linseed oil. The oil penetrates the wood pores, causing the felloe to expand. This treatment is good for the wheel, since it makes it waterproof. Two quarts of oil will be more than enough to treat a wagon but it will probably be convenient to use at least that much, so as to be able to immerse a considerable part of the wheel in the bath at one time. Allow two or three minutes for the oil to soak in, before turning the wheel to a fresh place for treatment. An old dishpan and paint brush may be used to facilitate the work. In 24 hours after this treatment the tire will usually be found very firmly set. The wheels should of course be dry before giving the treatment.

The best insurance against disease

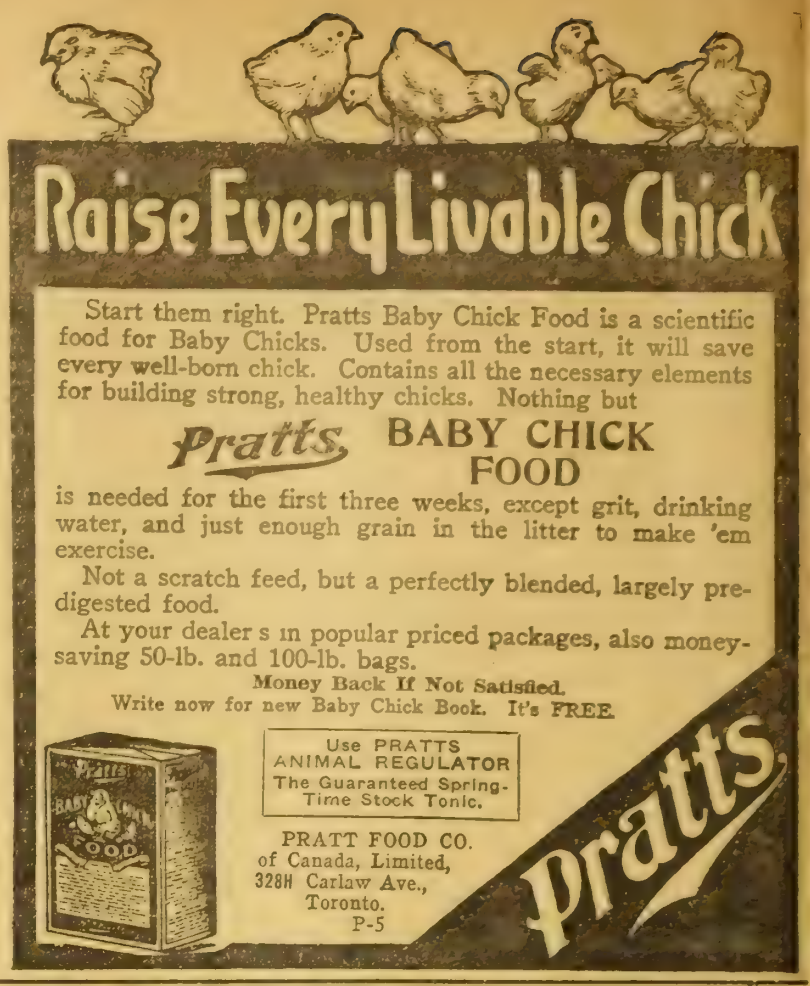
POULTRY.

ANNUAL MEETING OF THE NOVA SCOTIA POULTRY ASSOCIATION

The annual meeting of the Nova Scotia Poultr Association took place at the Agricultural College, Thursday, March 13th, at 10 a. m. Mr. E. C. Griffin occupied the chair. Fifteen delegatesfrom different Poultry Clubs of the province attended. Minutes of the last regular meeting were read and approved. Mr. Frank E. Jackson reported that the Poultry Show building at the Sydney Exhibition had not been improved. Interest in Poultry at North Sydney was as keen as ever. More chickens were raised during the last year and the clubs imported more poultry and feed for their members. Mr. W. W. Osborne reported for the Pictou County fancies and stated that a show had not been held in Pictou County during the last lear, but they were now re-organizing their Poultry Club, and were going after the Association to carry on a large show next fall. He stated that the difficulty of obtaining feeed of good quality at a reasonable price had kept many from enlarging their poultry flocks. Mr. Thomas Barrett, Stellarton, reported that their Association was being re-organized and would develop more strength and would assist in increasing the quality and number of poultry in the County of Pictou. He also called attention to the high express rates and asked for united action on the part of our Association in reference to express rates on live poultry for exhibiting. It was unanimously agreed that the Secretary deal with this matter and report to the Executive as soon as a reply could be had from the Express Companies. The date for the next Poultry Show in Pictou County was selected and reserved for this particular show. The dates selected were November 13th, 14th and 15th. Mr. R. J. Messenger reported for the Annapolis Poultry Club. The high price of feed and the scarcity during the last two years has retarded the increased production of poultry in htic County. The price rel ceived by the farmers for poultry and eggs was better than ever before but feed had at a prohibitive price. Mr. Fred Bath, Bridgetown, stated that the reason a show was not held in Annapolis County during this year was particularly due to the prevalence of influenza and to the difficulty of obtaining suitable dates on which to hold their show. He stated further that relief was necessary in regard to the feed situation before much could be expected in Annapolis County in Poultry production. Mr. Alden Harris of Wolfville, reported that a good show of Poultry had been held at Wolfville during the past season. Their show was held in an apple warehouse which makes an ideal Poultry Show building. Mr. John R. McMullin of Truro, reported for the Colchester County Poultry Association and stated that the first show held had an entry of about 300 birds. The show held in December of last year had an entry of over 800 birds, of a greatly improved quality over those exhibited at the first show. The egg exhibit of over 30 entries was a credit to the show and showed the interest taken in egg production. The dressed poultry at this show was superior to any exhibit of the kind held in the Province of Nova Scotia. As a delegate of the Colchester County Poultry Association Mr. McMullen stated that, he was instructed by his Association to impress upon the Department of Agriculture and the Nova Scotia Poultry Association the necessity of holding an egg laying contest at the Provincial Agricultural College . He outlined the success which attended the organization of similar laying contests in the Province of British Columbia. Much interest was manifested in a contest of this kind and farmers were induced to cull their flocks and discard from their flocks all unprofitable and unproductive fowls. Mr. Ambrose Rogers, the youngest delegate from any Poultry Club represented the Boys Poultry Club of Guysboro County, and in a neat speech impressed upon the other delegates that Guysboro County had some good poultry and was in a position to supply eggs for hatching to other parts of the Province. He stated that he represented a club of school boys who had undertaken the poultry improvement work and had held two shows of pure bred poultry in this County. They had competed for a silver cup donated by Mr. Jas. Tory and this cup has been won twice by a young exhibitor of light Braham fowls. Mr. Landry, Secretary, in the absence of the President, reported the proceedings of the Canadian National Conference held at Ottawa on the 18th 19th and 20 of February. This convention of representative Poultrymen throughout Canada had made recommendation to the Department of Agriculture in reference to the export trade market intelligence, increased consumption, opening of European trade, the formation of National Poultry Council, the Organization of Boy's and Girl's Clubs in every district where possible, the improvement of the stock in the country through egg laying contests and official records of performance, the standardizing of prize lists for County and School Fairs, increased facilities for cold storage, for poultry and eggs, and the removal of the standard price on bran and shorts.. Mr. Thomas Barrett, here stated that their Association requested the services of the Provincial Poultry Superintendent to visit the schools in Pictou County to intreest the children in the production of more poultry in this County. A discussion here followed in regard to certain breeds which have been carried in the prize list and which were not considered of sufficient value from a utility standpoint. It was decided unanimously that certain of these breeds should not longer appear in the prize lists of poultry shows which received department assistance. Mr. McMullen brought to the attention of the convention the two Provincial Shows and suggested that none but these two shows should be open to the entire province. Some discussion followed and it was generally admitted that each district should maintain their own show and patronize the Provincial Show at Halifax and the Maritime Winter Show at Amherst.

The afternoon programme consisted of an adress on "Poultry Feeding," by J. P. Landry and an address from Mrs. Jas. Stoddard, Mt. Denison, Hants C.,, on "Profitable Production of Poultry." Mrs. Stoddard's address was listened to with close attention and outlined her financial statements for three different flocks during the past three years. Mr. Bath suggested that the next meeting of the Association be arranged so that one whole day be devoted to the business before the Association and would prefer the day following the close of the Short Course.

In the evening meeting Mr. E. E. Freehill ,of Antigonish, stated that the influenza epidemic interfered with the holding of the show in this county. The quality of the poultry had improved by the holding of this show and he would not suggest the discontinuance of the show among the Poultrymen of this County. Mr. W. T. Mattinson reported for the Glace Bay Poultry Association and stated that a great increase in Poultry had occurred in Cape Breton. Mrs. Stoddard, and Mr. Landry had spent a week in the County and had visited the different schools interesting the children in the production of more poultry; the result was apparent in their last poultry show. The children were limited to two birds each and the exhibit placed in the show by these school children amounted to about 1,000 chickens. Mr. McMullen again brought to the attention of the Association the necessity for taking prompt action in regard to the holding of the laying contest. A committee consisting of Mr. H. H. Hull, Glace Bay; W. W. Osborne, New Glasgow, and Mr. John McMullen, was appointed to interview the Secretay and the Premier of the Province to press for immediate equipment and material to conduct an Egg Laying oCntest at the Agricultural College to begin on October 1st, 1919. This Committee was instructed by the Association to await on the Secretary of Agriculture, Prof. M. Cumming and place their views before him at an early date. A discussion followed in reference to the reorganizing of the Maritime Poultry Association and the Association decided to leave this matter as it now stood until the Maritime Poultry Show is held at Amherst. A Committee consisting of Messrs. Landry, Mattinson and Bath were apointed to draw up and submit at the next annual meeting an amendment to the constitution as outlined in the "Act for Encouraging Poultry Breeding." Mr. Bath wanted a copy of the minutes forward-



Raise Every Livable Chick
Start them right. Pratts Baby Chick Food is a scientific food for Baby Chicks. Used from the start, it will save every well-born chick. Contains all the necessary elements for building strong, healthy chicks. Nothing but
Pratts BABY CHICK FOOD
is needed for the first three weeks, except grit, drinking water, and just enough grain in the litter to make 'em exercise.
Not a scratch feed, but a perfectly blended, largely predigested food.

Could Not Work

ON ACCOUNT OF

SEVERE HEADACHES.

Headaches are generally caused by some disturbance of the stomach, liver or bowels, and although not a serious complaint, the cause should be removed before they become habitual and make your life miserable.

You will find that Milburn's Laxa-Liver Pills will remove the cause by moving the bowels gently, safely and surely, refreshing and strengthening the stomach, toning up the liver, and thereby banishing the headaches.

Mrs. J. Armstrong, 7 Harris St., St. John, N.B., writes:—"I take pleasure in writing you concerning the good I have received from using Milburn's Laxa-Liver Pills. I had such severe headaches I could not do my work, but after using two vials of your pills, I can now do my work with comfort and pleasure."

Milburn's Laxa-Liver Pills contain purely vegetable matter and do not gripe like harsh mineral purgatives do. Price 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

ed for local publication and the Association instructed the Secretary to have this done. A resolution was passed asking the publishers of the Maritime Farmer for permission to use their paper as the official organ of the Association. The Secretary was instructed to complete arrangements to this effect. Mr. E. W. Osborne suggested that any persons who had been improperly dealt with in purchasing stock should report it to the Secretary of the Association to be dealt with. If members of the Association an explanation should be demanded, if non members, all members to be notified of any unfair dealing of these breeders of Poultry. Mr. H. H. Hull reported in full the details of the organizing of a Federal Council of Poultrymen organized at Ottawa.

The election of officers resulted as follows: President, H. H. Hull, Glace Bay; Vice-President, E. C. Griffin, Port Williams; Executive Committee, Ambrose Rogers, Guysboro, E. E. Freehill, Antigonish, Fred Bath, Bridgetown, Alden Harris, Wolfville, W. W. Osborne, New Blasgow, Frank E. Jackson, North Sydney; Rerpresentative to Federal Poultry Council, H. H. Hull, alternating W. W. Osborne; Secretary-Treasurer, J. P. Landry.

RESEARCH WORK ON POULTRY DISEASES

For a number of years investigations have been conducted in Canada to determine the nature and prevalence of diseases of poultry.

The need for further research is emphasized by the fact that the exigencies of war-time have given a stimulus to the poultry industry, and it is natural to assume that theis additional interest has led to on increase, rather than a decrease, of poultry disorders.

When the work was first started by this department, very little was known about the diseases of fowls in this country. In order to cover the ground thoroughly, poultrymen were requested by press notices, correspondence and personal appeals to co-operate as fully as possible by sending in sick and dead birds for study and diagnosis. In pursuance of this policy, the department guaranteed the express charges, and in the last five or six years, the examination of specimens has become a task of considerable magnitude.

It therefore seems timely, when economy is the watchword, to make a few suggestions as to what work we desire to undertake, and to point out the various causes which result in individual deaths in flocks, and which can be easily recognized by the poultryman at home. In this connection, it may be pointed out that live and dead fowls are frequently forwarded to us via express from remote districts in British Columbia, Alberta and Saskatchewan, and the expense of transporting these birds is wholly unjustifiable where the losses are limited to one or two fowls.

From a study of our records, individual losses may be attributed to the following conditions, none of which can be transmitted to other members of the jock:

Affections of the Heart.—These are usually manifested by a quantity of fluid within the covering membrane, an din some instances by an accumulation of yolk-like material, the result of inflammation.

Rupture of the Liver.—This occurs in fowls which are excessively fat, and is recognized by sudden death, and the filling of the bowl cavity with blood.

Apoplexy, or a rupture of a blood vessel in the brain. This disease can be de termined only by the absence of other lesions, and the suddenness of death.

Peritonitis, or inflammation of the bowels and covering membranes. Peritonitis is caused by the partial debelopment of eggs in the bowel cavity; closure of the egg-duct by large eggs; or accumulated yolk material, etc. Frequently the diseased ovary is responsible for this latter condition.

The above diseases are those usually responsible for individual deaths, and may easily be detected by examining the birds.

The infectious diseases which spread rapidly through flocks concern us chiefly. Such diseases as Fowl-cholera, Tuberculosis, Blackhead in turkeys, Roup and Coccidiosis may be classified as infectious, and it is essential that they be recognized early, so that their spread may be checked.

Worms are also very troublesome, and we have already published directions for getting rid of these parasites. These bulletins may be obtained upon application to the Publications Branch of the Department.

If poultry owners desire to have parasites identified, the parasites—preserved in alcohol and securely packed—may be sent by mail to the Laboratory.

With reference to Tuberculosis and Blackhead, our bulletins fully describe these two diseases, and any poultryman should be able to diagnose them after reading our literature and seeing the illustrations.

To prevent misunderstanding of the aims of the department, we wish to restate that we are desirous of investigating affections which are responsible for large losses.

In cases of suspected poisoning, a public analyst should be consulted, as we do not undertake work of this nature.

As perviously stated, where only one or two deaths occur, the express charges usually total more than the market value of the birds.

We trust ,therefore, that poultrymen will assist us in our economic policy and send fowls only when several death have occurred simultaneously and the cause cannot be determined at home.—By A. B. Wickware, Assistant Pathologist, Biological Laboratory, Ottawa.

COMMON COLDS IN HENS

When a fowl contracts a cold—and, like human beings, by sneezing, it generally gives indications of having done so—it should be isolated. Should there be froth over the eyes, or a discharge from the nostrils and mouth, sponge these parts daily with warm water to which has been added a few grains of potash.

Should the head appear swollen, sponge it with equal parts of vinegar nad water. Administer twice daily, a teaspoonful of cod liver oil, to which has been added three drops of oil of eucalyptus and two drops of pure terebene.

KEEPING THE FLOOR CLEAN

The scratch material on the poultry house floor should be removed and renewed several times during the winter; it is well to give the floor a dusting with lime after each removal of all material. If a dirt floor is used it is well to remove a little of it from the entire floor and renew it with fresh soil in which a little powdered lime is mixed. Then put on the scratch material.

If you do not have time to remove the droppings often, have a box of fine earth handy and scatter some over the droppings occasionally. This is almost as effectual as removing them.

SARNIA POULTRY FENCE
Make More Money!
Buy a Real Poultry Fence
THERE is a growing demand for a lighter weight fence suitable for poultry yards, orchards, gardens and other farm purposes. There is also a demand for a heavier weight poultry fence than the so-called poultry netting. You may have had some experience with the light weight netting, and, if so, you know that it is a waste of time and money to put it up, besides it always has a loose, shiftless appearance. The Sarnia Fence overcomes these objectionable features. The extra strength of our fence enables us to stretch it to any desired tension. Stay wires and lateral wires in this fence are fastened securely by the famous Sarnia Knot, providing ample rigidity in the body of the fence and making it adjustable and suitable for various purposes about the farm. The Sarnia Fence is close enough to turn small fowl, yet strong enough to turn a large bull, thus affording perfect protection to your yards and grounds.
SARNIA POULTRY FENCE
is easily constructed, requires less posts. You don't need a top or bottom board to keep it in place. Lasts many times longer than netting because its wires are larger, stronger, and the fence itself is attractive and durable. There is no buckling of wires. It is easily constructed over uneven ground; no sagging or bagging as in the case of the flimsy netting, and when it is once properly constructed it is there to stay. It gives you real fence satisfaction. Poultry farmers all over Canada testify to its value. It is the "Farmer's Friend" kind. Poultry in Canada has gone a long way toward keeping the home table supplied while the boys were "over there." Build the poultry business for permanency as a business. Sarnia Fence will do its part. Will you do yours? In your new drive for business, don't forget that poultry is a business, and that Sarnia Poultry Fence is necessary to your success.
Sold and shipped direct from factory to farm, freight prepaid. Send for our descriptive literature about farm fencing, gates, lawn fencing and supplies. Prepaid freight prices are quoted in Old Ontario, New Ontario, Quebec, Maritime Provinces, four cents per rod extra. Our office at Winnipeg takes care of all Western Canada business. Shipments made F. O. B. Winnipeg. Order now. Have your fencing in hand early, and when you need it. Let's tell you what the Sarnia Poultry Fence will cost laid down at your railroad station in whatever quantity you may desire.

Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

The year's at the spring,
And day's at the morn;
Morning's at seven;
The hillside's dew-pearled;
The lark's on the wing;
The snail's on the thorn:
God's in Heaven—
All's right with the world.

—Robert Browning.

LITTLE MISS CLOCKMAKER

(By Gertrude Brooke Hamilton.)

Among the antique shops on Fourth Avenue, in New York City, was an old clock-shop. It's windows displayed rare and curious timepieces—a "Sol" clock with a brass face surrounded by onyz rays, a musictl clock of gay colors, a shuttered clock with gargoyle on top, and a tall peacock clock marked with eyelike spots of iridescent greenish blue. Unobtrusively lettered on a corner of the window was: "Lazare Chanson, Le Petit Horloger."

Lazare and his two fine sons Adrien and Crepin were no longer in America, nor in France, where they had gone to fight; Lazare, Adrien and Crepin were among the shadowy thousands who had lost their lives in the trenches. Lazare's wife, Rarhel, an American, and his young daughter, Bluette, were running the old clock shop. The bulk of the responsibility fell upon Bluette, because Rachel, on learning tardily of her triple loss, had become an "innocent"—that is, a child in mind.

Bluette, though wearing a black smock for her beloved father and brothers, still found the world a merry place to live in. Bluette was seventeen, lovely as the spring, simple, spirited, deeply religious. She felt truly that in all loss God knows best, and that in all circumstances God provides. When the need had come to move from the pretty uptown apartment, she had gayly taken Rachel to live in the meager flat behind the old clock-shop and had naively undertaken to sell the clocks. In the few weeks she and Rachel had lived in the little flat behind the shop, each morning had found Bluette Chanson with a song on her tender lips.

She sang like a skylark as she opened the shop one gray, black morning. Down on Fourth Avenue the early traffic was rumbling by, and on the sunless, battered pavements battalions of people were going to work. Bluette showered her lark-song upon them: the good people starting out on a good day, guided by the good God.

When she had opened the shop, Bluette looked out in the hall for her daily pint of milk. Some mistake had been made that morning, and the Chansons had no milk. Bluette ran to the hall stairs and halloed down them in her slight, sweet voice to the janitress of the building, asking about the milk.

A door was opened on the floor above, and a coatless individutl with a smug torso and supercilious shoulders came to the banister and looked at Bluette Chanson. "I beg your pardon, miss," he said respectfully. "Can I be of service to you?"

Bluette glanced up with a frank smile. "Our milk has not come, and my mother must have her chocolate," she explained.

"I would be happy to loan you some milk," said the man.

"Have you plenty?" asked Bluette.

He bowed. "Plenty, miss." He returned to his flat, and came down in a minute or two with a pitcher of milk nicely placed on a smal ltray.

"Thank you," said Blette. "It is kind of you."

"Don't mention it, miss. I hope to serve you again. I am Mr. James Marrow. I have lived in the flat above for many years." He added with discreet impulsiveness: "May I venture to tell you, miss, that I hear you singing quite often?"

"I hope it doesn't disturb you," laughed Bluette.

"Not at all, miss," replied James Marrow, bowing. He ascendeed the stairs with a modified, web-footed tread.

Bluette carried the pitcher of milk htrough the old clock shop to the shabby room ehind it, where Rachel Chanson was playing with some toy soldiers that had belonged to her son Adrien. "We came near not having our chocolate this morning, Maman," said Bluette "Luckily we have a kind neighbor." She prepared the chocolate and buttered some finger-rolls.

"Breakfast, Maman," she said tenderly.

After the chocolate and rolls, Bluette climbed to the window of the shop to wind the peacock clock. While she was pulling the bronze weights, the clock struck—eight times a mechanical peacock strutted out and spread its multicolored tail. Bluette glanced down at Fourth Avenue with a tinge of eagerness, a flash of expectation. Her dancing eyes alighted on a passing automobile, in the tonneau of which a handsome young gentleman was comparing his watch with the time of the peacock clock.

Bluette gave a vagrant sigh. For a week the handsome young gentleman had slowed his car at eight o'clock to compare his watch with the peacock timepiece.

Laughter sparkled over Bluette's' face as she climbed from the window back into the shop. "With so many nice people on the street, Maman," she called, "surely some one will come to buy a clock." She ran into the rear room to wash the chocolate cups—and the bell over the door of the shop tinkled.

Delighted at the thought of some one coming to buy, she ran back. Then she blushed, and stood abashed. The customer was the handsome young gentleman who for a week had shown concern over the time his watch was keeping! He was handsome enough to dream about; his gray eyes were lonely; his brow was idealistic; and his sweet mouth had a humorous quirk.

With a graceful sweep of his left hand he removed his hat. "Does Lazare Chanson mend watches?" he asked courteously.

Bluette touched her black smock. "I am la petite horlogere," she said simply.

He laid his watch on the ancient clock-counter. "There's something wrong with one of the hands, I think," he said.

She picked up his watch. With the sensitive, delicate fingers she had inherited from Lazare, she clipped off the cystal and examined the lagging hand. "If you will leave this," she said, eyes down, "I'll see what can be done." She took a pad from a clock-shelf, for his name and address.

His name was Reed Mockabee, and he lived on East Sivty-second Street. After he had given his name, he strolled about the shop looking at the clocks.

Bluette, remembering how Lazare had handled his customers, essayed to display some of the clocks. She showed Reed Mockabee a mother-of-pearl timepiece that was three hundred years old, and she turned the key in a clock with dancing marionettes. She loved the dancoing marionette clock—and she was easily persuaded to turn the key a second time.

"Happy as I'd be to sell this clock, I think I'd cry over the sale," she confided.

"I'll never buy it," smiled Mockabeee. "For I'd hate to drench any happiness with tears." He laughed—a fine laugh that filled the shop with young manhood.

Rachel Chanson come from the rear room with wonder on her face. "Are you home again, Adrien?" she asked Reed Mockabee.

Bluette ran to Rachel and put her cheek against her mother's hair. "Not yet, dear," she soothed. "Play with your soldiers."

"And Crepin—and Lazare?" questioned Rachel, turning to the rear room.

Bluette tremuously explained to Mockabee. "She hasn't had her reason since my father and brothers were killed in France."

"The wars are hideous," said Mockabee looking at Bluette's black smock. "But I envy the men who can fight. My right arm and hand are useless—they've been paralyzed from birth." His lip curled, emphasizing the lonliness of his gray eyes.

Bluette was strangely stirred. "There are many things one can do," she said vaguely.

He half laughed. "What things can a left-handed poet do " he demanded.

She eyed him with timidity. "Are you a poet?" she asked.

He nodded, mouth quirking. "Haven't you read any Reed Mockabee verses?"

"No," said Bluette. "But I'd like to."

He smiled at her. "When shall I call for my watch?"

"I'll mend it today," said Bluette.

"I'll come tomorrow," said Reed Mockabee, going.

As the door with the little bell closed behind the handsome young gentleman, Bluette laid his watch in the repair box. "We are having good fortune today, Maman!" she called. Roseate, she flew to the rear room, washed and dried the chocolate cups, laundered a couple of caps for Rachel—and chatted trustfully of the future. In the afternoon she studiously tinkered with Reed Mockabee's watch and succeeded in mending it.

She was making a veal ragout for dinner, when the little bell sounded nad James Marrow entered the shop, carrying a plate adorned with a piece of sugared pastry.

"Do you care for sweets, miss?" he inquired, holding out the plate for her

inspection. "I am a waiter in the Hotel Breslni—we waiters are given the old pastry. You'll find this apricot tart very nice, miss."

"Thanak you," said Bluette, accepting the plate of pastry. "You are very kind."

James bowed, and pullel the large lobe of his ear. "I hope the clock-business goes well, miss," he ventured.

"Our shop is never over-crowded," admitted Bluette vivaciously. "But we had a watch to mend today. One never knows—tomorrow I may sell a clock."

"I hope so, miss," said James. He coughed behind his hand; and murmered confidentially: "I have a good many regular patrons at the hotel, miss; and if I find the ipportunity to mention your clock shop, I shall be happy to do so."

"Thank you," said Bluette graefully.

"If at any time you need my services," continued James, "I am always at home when not at the hotel." He lowered his voice. "I spend my spare time working on the invention of a food capsule, miss—aimed to sustain life, please the palate and do away with knives and forks. A waiter sees much time wasted, miss."

Bluette laughed merrily. She felt James Marrow already a friend, a comical servitor in the friendly world.

She showed the pastry to Rachel and finished the preparation of her veal ragout with singing spirit. After dinner she took Rachel for her evening walk—along Fourth Avenue and up Park as far as Grand Central Station. At nine o'clock Rachel went to bed . Bluette climbed into the unlighted window of the old shop and sat in the shadow cast by the peacock clock. Far above the city shone the stars and a cradle moon. God's region was deep and blue, full of tranquillity. Bluette leaned back against the peacock clock and felt no fear of the morrow.

Reed Mockabee came for his watch the next morning. "I've been thinking about you," he told Bluette with his melodious laugh. "D'you know, I wouldn't have pluck enough to face your siuation myself."

Bluette laughed gaily. "You'd have pluck if you had to have it."

"Would I?" he answered indolently, eyes on her face. He took stock of her. "Suppose you fail?" he humorously pondered.

"The person trying to do the good thing can never fail," said Bluette with soft surety.

He looked down at his helpless right hand. "Suppose I tried to fight," he said. "Wouldn't I fail?"

"I don't know," said Bluette, confused.

There was a slight pause. Then Mockabee took a little volume from his pocket and pushed it across the clock-counter. "Some of my doggerel," he said.

Bluette picked up the volume. "I've never known a poet," she said with a touch of awe.

"May you never know another!" smiled Mockabee. He walked to the window where the timepiece was striking. "Do you sell many clocks?" he questioned.

"Not a clock have I sold'" laughed Bluette. "But soon I shall, very soon."

"Yes," said Mockabee, "I believe you will. You have grit." His handsome face shadowed. "I haven't," he acknowledged, half laughing. "I'm not like you—with the stuff that goes to make up somebody's ideal." He made her a graceful, admiring bow. "Good-by," he said, leaving.

Bleutte opened the volume of verses and read some of Reed Mockabee's rhymes: idle songs of life and love. She left them only when her daily tasks called her, to return to them at the earliest opportunity. She read them raptly.

At noon there came a customer who bought a clock.

The bit of luck sent Bluette soaring. She went marketing, purchased a squab and a pot of current jelly for Rachel. That evening she wrote a stammering, eager little note to Reed Mockabee, about his verses.

The handsome young gentleman did not reply—and when Bluette wound the peacock clock in the morning and glanced with her flash of expectation down at Fourth Avenue, there were no longer the lonely gray eyes to laugh down into. But Bluette was content: she had verses to read; God aws letting her have success in the clock business; and she had a polite neighbor in James Marrow, whose offerings of day-old hotel dainties, inquiries after her welfare, and sundry acts of service, never fluctuated.

Reed Mockabee sauntered into the clock shop one day. "How are you getting along, somebody's ideal?" he asked.

Bluette blushed happily. "I'm growing rich," she told him in an intimate tumble of words. "Yesterday I sold the peacock clock. I'm making good."

"I knew you would," smiled Mockabee, walking about the shop. 'I see you haven't sold the marionettes yet," he laughed. "How's your mother?"

"I'm afraid this downtown air isn't very good for Maman," responded Bluette sadly.

"My car is outside," said Mockabeee, turning the key in the marionette clock. "Suppose we take your mother for a ride—would she enjoy it?"

"Oh yes," said Bluette.

"Get your mother ready," smiled Mockabee. "We'll spin out to the Westchester hills."

Bluette ran to make Rachel ready for the ride. She pressed her cheek to Rachl's "God is good, Maman!" she exulted.

The ride in the automobile brought faint color to Rachel and made Bluette bloom like a flower.

"Why don't you live where you get better air?" asked Mockabee. Fourth Avenue isn't good for your mother's nerves."

"I must sell the clocks," said Bluette, arm about Rachel.

Mockabee went on in his attractive, impracticable voice. "When I'm fagged I often leave town on a copule of hundred acres I have down in Maryland. I call the acres 'Silver Vale'—you should see them." His face became dreamy. "Orioles flashing in the sunshine, meadows of tall grasses, stretches of deep woods, runs of lapping water. I've written most of my verses there."

"Your verses are ewonderful," said Bluette shyly.

"I'll send you some more of them," smiled Mockabee. Then his brows met over his gray eyes. "These are not silvery days, are they?" he demanded with irony. "Not days for a poet!"

"I think," said Bluette hesitantly, that poets are needed as well as fighters, in these days."

"Thank you, fighter " His smile came back, and he looked at her as if she had started poetry in him.

His look started song in Bluette—a medley that was like a hymn. She spoke at random. "Maybo I'll get enough for my marionette clock to take Maman some place like Silver Vale."

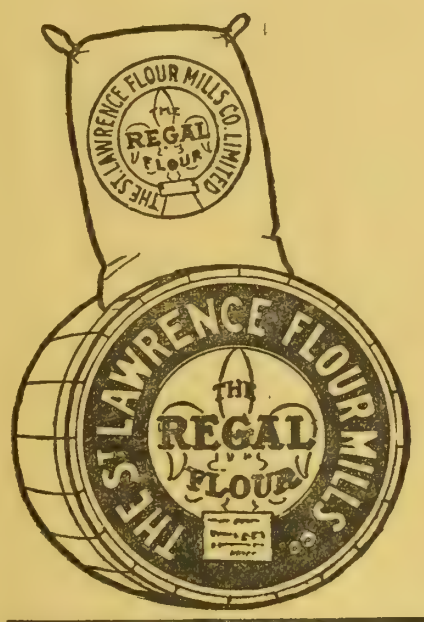
Mockabee laughed—still looking at her with the lost eyes of a quickened poet. Then he roused himself! "It's fine to be as practical as you are," he said enviously.

"Am I practical?" she said, blushing with pleasure.

"Aren't you?" His look steadied as it stayed on her. "Aren't you everything that I'm not?" he pursued, mouth quirking. He put out his left hand and touched her right hand. "Just what do you think of me?" he said suddenly. "I'm nearly thirty, one-handed, a versifier. Just how much contempt have you for me?"

His banter made her unable to say how little contempt she had for him.

The Big Value in
FLOUR



IN THE HOMES of the people, far and near, "REGAL FLOUR" is known for its high and uniform quality; it is known as the most important factor in bread baking success.

THE ST. LAWRENCE FLOUR MILLS CO.
LIMITED
MONTREAL

Troubled With Kidneys For Over Three Years.

WAS CONFINED TO BED.

Mrs. George Gray, Hopewell Hill, N.B., writes:—"I had kidney trouble for over three years, and was so bad I was confined to my bed. First I contracted a bad cold and it went to my kidneys, and I suffered dreadfully. I got the doctor, but he did me very little good. I tried all kinds of kidney pills, but got very little help. One of my neighbors came in to see me and told me to get Doan's Kidney Pills and give them a good trial. I used five boxes and they have cured me so that I can sleep all night without being disturbed, and I feel better in every way. I cannot say too much in favor of Doan's Kidney Pills."

Doan's Kidney Pills are just what their name implies; a pill for the kidneys and the kidneys only. When you ask for "Doan's" see that you get them put up in an oblong grey box with our trade mark "The Maple Leaf". Price 50c. at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

His face became completely unhappy. "I'm about as much good to my country as my silvery acres in Maryland!" he scoffed.

Eyes brimming, she protested. "Oh no!"

"Oh—yes!" he lightly contradicted. "Don't try to soften your unwillingness to give me your frank opinion." His steady look uncovered a flash of strong emotion, and turned away. He changed the tenor of the conversation.

"Here's soping you'll soon shed happy tears over the sale of your marionettes, fighter.

Some one bought the marionette clock a day or two later, for a round price. Bluette attributed the sale to God in her prayers, and thanked Him for her success.

Reed Mockabee sent her another volume of his poetry. She read the second volume of love-verses blissfully. She felt, with happy simplicity, that Mockabee loved her, and that she loved him. She waited for events to shape some climax. She planned the sweet things that would come after a while. But as the days went on and she had nothing more personal of the handsome young gentleman than his verses, the songs she had sung in the mornings went out with the other pretty sounds that often die downtown in the city. James Marrow found an occasion to inquire why Bluette Chanosn sang no more. "I took pleasure in your light-hearted voise, miss" he stated.

Bluette was pensive. "One never knows. I may sing tomorrow," she said, thinking of what the morrow might bring her.

"I hope so' miss," said James; and he coughed behind his hand. "Do you care for flowers, miss?" he solicitously asked.

"Yes," replied Bluette, lost in her reverie.

James Marrow tendered Bluette a bouquet of hotel carnations that evening. "I presume you are versed in the language of flowers, miss?" he hazarded. Then he sighed, laid his hand on his smug torso and withdrew.

When Bluette put the carnations in water she found a note in them, addressed to her in a perpedicular hand. She opened it and read:

Dear Miss:

I have lived many years in this biulding, and it was my pleasure to know from a distance your lamented father and brothers. For many years miss, I have heard the clocks in the shop striking at night.

May I take the liberty, miss, to express my admiration for you? May I approach subjects we have not as yet discoursed upon? May I, miss, state my qualifications for the favor I am about to ask of you?

Miss, I am forty-eight years of age, wear a toupee and have several pivot teeth. Other than this, I am sound in mind and body. I come of English people, my father having been an honest yeoman. Miss, I have saved a modest sum and expect to make larger sums when my food-capsules are on the market. I have, as you may have observed, regular habits and an even disposition.

If I could serve you all my life, I would be most happy to do so. May I request the favor of your hand in marriage, miss?

Respectfully,
JAMES MARROW.

Bluette weighted the note with the vase of carnations, and laughed mirthfully. "Imagine it, Maman!" she said.

James Marrow came to see how she had taken the note.

Bluette gayly returned it to him. "May I tak the liberty of asking you not to write me such letters, Mr. Marrow?" she cried. Her gesture laughingly dismissed him.

But when he had gone, and she fell to thinking of Reed Mockabee, her own wistfulness made her feel sorry for James. She reflected upon her many blessings, the grit she possessed, and the good fortune that flowed t oher from all sides. She felt that she must be kind to everyone.

On an impulse she carried a cup of her nice chocolate up to the waiter's flat, and with an air of pretty royalty gave it to him when he opened the door.

James accepted the chocolate with respect. His eyelids were reddened; he had been crying.

Bluette saw this, and stretched out her hand to him. "If I hurt your feelings," she said sweetly, "forgive me."

"Don't mention it, miss," begged James.

"It was wrong of me to make fun of you," she insisted. Her face grew earnest. "How might I feel if a friend made fun of me?"

"We're bound to be made fun of, miss, as we go along in life," said James.

Bluette was reflective. "It seems a pity—for God never makes fun of us," sre said.

In James Marrow's flat a clock struck. Turning her head, Bluette saw through the open door her peacock clock, with the mechanical bird telling the hour by strutting out and spreading its multicolored tail. She looked in suprise at James Marrow.

An expression of guilt watered the waiter's counteance. "I have admired that clock for years, miss," he said apologetically.

"But I sold it to a stranger," said Bluette puzzled.

"Yes, miss," murmured James. And then another clock struck.

Bluette stepped quickly to the threshold of James' flat, and looked in. Her marionette clock was striking on a table, and all the clocks she had sold were there. They were ticking giving the domicile a sort of fatalistic craziness.

Bluette looked in amazement at James Marrow.

His embarrassment amounted to misery. "I hope you are not offended, miss," Marrow stammered. "I am partial to clocks, miss. And it is hard, miss, for a very young lady to make a complete success of a man's business. I spoke to several of my regular patrons at the Hotel Breslin, miss, about your shop. But when they did not seem interested, I ventured to hire divers persons to buy your clocks. They are really company for me."

Bluette smiled faintly. "I suppose," she said with difficulty, "I should thank you. You are kind." She made an unconsciously imperial gesture, and went down the stairs.

She climbed to the dark, almost empty window of the old clock shop and sat down behind the letters, "Lazare Chanson, Le Petit Horloger." She could no longer credit herself with success, for James Marrow had bought all her clocks. With thankfulness she had accepted success from Heaven—with joy she might have accepted success from Reed Mockabee. But she felt in debt to James Marrow. Lazare, her father, had told her never to get into debt.

Bluette Chanson opened the door with the little bell the next morning when she heard James Marrow coming down the stairs. "I'm in debt to you," she said simply. "So if you still wish it, I'll marry you to square the debt."

James bowed. "How are you in debt to me, miss?" he inquired.

"You bought my clocks from kindness," said Bluette.

"No, miss. I'm very fond of clocks. I may confess to you; I've had my eye on the clocks a good many years."

Bluette searched his face. "Then, maybe, you bought them just for profit," she faltered.

James laid his hanad on his breast. "I bought them from love, miss, begging your pardon," he admitted.

Her face brightened, then paled again. "You see," she managed, "I'm in debt to you."

"I have received full quota, miss," said James. Then he approached her, his shoulders straightening. "But if you feel, miss, that my qaulifications are sufficient—" He grew mealy with hope, and made bold to touch her hand.

Bluette shrank from him. "Oh!" she said in fright.

"Excuse me, miss," said James; and he instantly put distance between them. "I see it cannot be, miss," he stated. "If at any time I can serve you, miss, I am wholly yours to command."

Restraining tears, James Marrow withdrew.

An appalled feeling assailed Bluette as James disappeared. Despite her relief in having him refuse her agreement to marry him, he had been her friend; he had enabled her to absorb all the advantages of success, to keep are irresponsibility of adolescence. A sense of coming change shook her.

In agitation her thoughts fled to Reed Mockabee. Why had he never come to see her again? Surely her sweet surmisings had not been in vain! Surely the hymn he had started in her had its deity to sing to. She took from the clock shelf the pad she had written his address on when he had left his watch to be mended. And when Rachel had gone to bed that night, Bluette left the old clock shop and went up to the part of New York where Reed Mockabee lived. She found his house an imposing mansion, with all the shades drawn down. It seemed to make autocratic fun of her!

Bluette carried a clock to an antique dealer the next day and tried to drive a bargain. But the crafty old dealer, with his tangled beard and disappearing eyes, easily got the better of her, and she came out at the short end. She made up her mind to wait for legitimate customers—and the empty hours that dragged by made her realize more than ever her futility. James Marrow came down to the clock shop, and expressed a desire for the shuttered clock with the gargoyle on top. Bluette begged him not to buy the clock. James withdrew.

Bluette went back to the bearded antique dealer—and for hardly more than pennies, she parted one by one with Lazares rare clocks. The Sol clock with onyx rays was the last timepiece to go to the antique dealer, and when she had nothing left, Bluette set about packing.

"Where are we going?" asked Rachel.

"Where we can get nearer God, Maman," answered Bluette.

Rachel boxed her toy soldiers. "Come, sons," she said. She wept suddenly over a soldier that fell from the box.

The tenacious, elastic spirit went from Bluette . She sank into a chair, and felt any goal inconceivably distant: the eyes of her heart visioned Silver Vale, sunshiny acres where orioles flew, trees throve, streams gushed, and where the sun hung in the sky like a wine drop spilled from a chalice. She felt too far from sunshine to reach it.

She put her face in her hands, to have a practical talk with God. But her yearning imagination carried her to Silver Vale, to commune with nature; she seemed to see the feathered and nested birds, the trees, given sap, the flowers, given sustenance. Nature, with its rhythmical overflow and interflow, seemed to her browsing and dreaming insecurity. And it seemed to her that only humans had to fight for foothold. Perplexedly she thought of th generation in which she lived—of the crowded ships transporting armies of good men to other lands, of the good women left behind uprooted, with innocent mouths to feed.

She was astounded. "Why, where are you, God?" she whispered.

Lifting her face she looked about the depleted shop, and again visioned sunshine, and trees castiing comfortable shadows "Are You a poet, God?" she timidly enquired. "A poet, perferceting nature and neglecting us? There's sorrow in the world—havoc and lunacy and bewilderment. Where are You, God? You aren't awake! You aren't watching us!" Blankly she hid her face in an open volume of Mockabee's verses that lay on the ancient clock-counter.

She did not know how long her face was hidden in the timeless old shop; she was aroused by the tinkling of the bell on the door.

She saw Reed Mockabee standing inside the door. He was tanned, erect, changed—the lost look had gone out of his gray eyes; his sweet mouth had strengthened, and his shoulders were broader. He was dressed carelessly in brown corduroy trousers and jacket, boots, and a soft shirt the color of earth.

He stood for a second just looking at her. Then he doffed his broad hat, walked alertly across the old clock shop, leaned over the ancient counter —and smiled a salutation into her eyes.

She quietly fainted across the counter.

She came back to consciousness in his sound arm. He was bathing her face.

"What has happened to you, love?" he asked, aghast.

"Oh, love, where have you been?" she said, weeping.

His arm cradled her. "I've been down in Maryland—doing things. I've been turning my Silver Vale acres into a reconstruction training farm. I've a hundred and fifty wounded soldiers there, and people learning them new trades and ways to make a living. The last time I talked to you, Bluette, —how long ago it was!—I made up my mind I'd never see you again till I'd tightened [illegible] worth while." He pressed his cheek to her white one [illegible]. I—

The Problem of Good Shoes

There is not one person in a thousand who gives this subject the attention it deserves. A. H. M. shoes are sold in more than 5,000 retail stores all over Canada, and we know what we are talking about. Many people whom you meet every day are walking about in shoes which are not really comfortable, which do not retain their neat and attractive appearance, and which do not last as long as they should.

All this is unnecessary. For it is very easy to buy shoes which will give real comfort and long service, and which will keep one's feet looking trim and stylish. All that you need to do is to select the type of shoe which is suited to your foot, and to see that you are correctly fitted with the proper size and width.

Any reliable dealer knows the type of shoes which you ought to be wearing (for comfort's sake as well as long service), and he is able to fit you correctly. Go to him when you buy shoes, even if it means an extra trip. You will be well repaid by the extra comfort and the extra service which you will get from your purchase.

Look for the manufacturer's trade mark on the shoes you buy. It is your best assurance of good quality at a fair price. For no manufacturer will stamp his name upon a product which he is ashamed to acknowledge.

We have prepared a booklet, "How to Buy Shoes" which will help you. It is sent on request to any address in Canada. May we send you a copy with our compliments? Write to our head office at Montreal.

How Familiar Are You With the Features of the Great Men of To-Day? Here is a Real Test.

THE above four diagrams represent incomplete pictures of four of the world's greatest men—men you read and hear about every day of your life. Complete the four pictures by tracing from number 1 to 2 to 3 to 4, and so on until the pictures are finished and the faces of these great living men will be revealed to you so that you should quickly recognize them. Can you make them out?

Below each picture in jumbled letters is the correct name of the great man represented in the diagram above it. Unscramble the letters of his name so that you can correctly name him. In the far column will be found a list of a few of the world's outstanding great men. This list may prove of service to you.

The best completed pictures with the names correct can win $510.00 in cash. The completed pictures must be clipped from this paper and attached to a separate sheet containing the names of the great men represented by the diagrams, together with complete name and address of contestant in the upper right-hand corner of paper. Complete list of grand prizes to be awarded is shown in the next column.

This Great Contest Is Absolutely Free of Expense—Send Your Answers To-Day!

This great contest is being conducted by the Continental Publishing Company, Limited, one of the largest and best-known publishing houses in Canada. That is your guarantee that the prizes will be awarded with absolute fairness and squareness to you and every other contestant. Frankly, it is intended to further introduce EVERYWOMAN'S WORLD, Canada's Greatest Magazine. You may enter and win the best of prizes whether you are a subscriber to EVERYWOMAN'S WORLD or not—and moreover, you will neither be asked nor expected to take the magazine or spend a single penny of your money in order to compete.

HERE IS THE IDEA.—EVERYWOMAN'S WORLD is so popular everywhere that it now has the vast circulation of over 100,000 copies a month. But our motto is "EVERYWOMAN'S WORLD in every woman's home." We want more Canadian magazine readers to become acquainted with this famous publication. Therefore, when we acknowledge your entry to the contest and you know your standing for the prizes, we shall send you, **without cost**, a copy of the very latest issue and a review of many of the fine features soon to appear. Then, in order to qualify your entry to be sent on for the judging and awarding of the grand prizes, you will be asked to assist us in carrying on this big introduction plan by showing your copy to just three friends or neighbours, who will appreciate this really worth-while, All-Canadian magazine and want it to come to them every month. You will easily fulfill this simple condition in a few minutes of your spare time, and we will even send copies for each of your friends, if you wish.

THE PRIZES

1st -	$200.00 Cash
2nd - -	100.00 Cash
3rd - -	50.00 Cash
4th - -	25.00 Cash
5th - -	15.00 Cash
6th - -	10.00 Cash
7th-28th each,	5.00 Cash

PRIZES GUARANTEED

How To Send Your Solutions.

Use only one side of the paper that contains names of the great men represented by the pictures, and put your name and address (stating Mr., Mrs. or Miss) in the upper right-hand corner. If you wish to write anything but your answers, use a separate sheet of paper. Attach this to your completed pictures clipped from this paper.

Three independent judges, having no connection whatever with this firm, will award the prizes, and the answers gaining 300 points will take the First Prize. You will get 25 points for every picture completed correctly and 25 points for every name solved correctly. 15 points will be awarded for general neatness, style, spelling, punctuation, etc., 10 points for hand-writing, and 75 points for fulfilling the conditions of the contest. Contestants must agree to abide by the decision of the judges.

The contest will close at 12 o'clock noon, August 30th, 1919, immediately after which answers will be judged and the Prizes awarded. Address your answers to-day to—**Famous Folks Competition, Continental Publishing Company, Limited Continental Building, Dept. 10 TORONTO, ONT.**

want to be somebody's ideal!" He was eager, ardent. "Am I nearer?" he demanded. "Do I measure up, fighter.

She looked up at him woefully, eyes enormous in her lovely wan face. "Am I anything to measure up to?" she faltered. Head drooping, she told him how James Marrow had bought most of her clocks from kindness, and how she had secrificed the rest. Head lifting, she told him, in her soft, simple voice, how she had reached the end of her world.

Then the handsome, tanned young gentleman looker in agitation at her, and in a burst of emotion kissed her hands. "Why, fighter! I thought you self-sufficient as a goddess! A slim Amazon, delighting in your two-handed fight! And you've needed me! You've suffered!" His kisses on her hands were contrite.

In utter confusion she pulled her hands from him—to hide her face again in the open volume of his verses on the ancient clock-counter.

He looked with a quickened glance at the volume. Color boomed up under his tan, and his mouth quirked. "The orioles and sunshine still sing to me," he lauaghly admitteed, and pulled a batch of manuscript from the pocket of his corduroy trousers. "Here's doggerel for the trench-fighters and the fellows on the ships, verses to make them think of their beloved women." His words slowed, full of melody. "Verses, inspired by 'la petite horlogere!' " He laid the manuscript on the clock counter, caught Bleutte in his arm. "I love you!" he said, his eyes claiming her.

Bluette closed her eyes. "God is with us," she whispered. "He is awake and watching."

LARGER VIEWPOINT URGED UPON WOMEN

The meeting of the St. John Branch of the Women's Institute recently held in the Congergational church hall was not only an instructive and helpful one, but was also especially enjoyable because of the musical selection which were part of the programme. There was a large attendance of members and the president, Mrs. J. W. V. Lawlor, occupied the chair.

In her opening address Mrs. Lawlor spoke of the progress made in enrolling the desired 1,000 members and urged all of the present members to bring others in order that the institute would have substantial backing and be able to demand improvements and get them. The question of a suitable meeting place for the institute was discussed and it was decided to leave this matter in the hands of the room committee.

A letter was read from Miss McCann, superintendent of the Women's Institutes for the province, in which she congratulated St. John on the formation of a Woman's Institute and impressed the greatness of the need for having such an organization for the betterment of the home and for bringing information to the aid of women's work.

Mrs. Lawlor outlined some of the topics which will be brought up for discussion at future meetings, among whic hwere the housing problem and explanations of federal and civic laws for the better understanding of women. She said that she hoped at the next meeting a lecture on criminal laws affecting women would be delivered.

The meeting endorsed an editorial which appeared in a local paper advocating the rebuilding of the court house in such a manner as to provide accommodation for a meeting place for women's societies.

A resolution was passed unanimously which stated that the institute strongly urged the wrapipng of bread in waxed paper, more especially as a health measure after the recent epidemic of influenza. A copy of the resolution will be sent Hon. Dr. Roberts.

It was also agreed that the meetings of the institute would in future commence with the singing of O Canada.

In her closing remarks, Mrs. Lawlor appealed to the women to broaden their viewpoint, not only to take an interest in their homes, which was one of their highest privileges, but to take an interest in the welfare of the community, and thereby improve both themselves and the community.

Vocal solos were given by Mrs. Long and Miss Anderson and Mrs. A. C. Wilson gave a recitation, all being heartily aplauded, and the meeting closed with the singing of the National Anthem.

Linoleum will keep bright and last longer if you apply white shellac with a clean paint-brush two or three times a year. Linoleum should be clean and dry before shellac is put on and be careful not to lap the strokes.

We have been using MINARD'S LINIMENT in our home for a number of years and use no other Liniment but MINARD'S, and we can recommend it highly for sprains, bruises, pains or tightness of the chest, soreness of the throat, headache or anything of that sort. We will not be without it one single day, for we get a new bottle before the other is all used. I can recommend it highly to anyone.

JOHN WALKFIELD.
La Have Islands, Lunenburg Co., N.S.

RESOLUTIONS PASSED AT THE N. S. FARMERS 'ASSOCIATION

(Continued from last issue.)

Whereas the market in the Maritime Provinces for such produce as meat, buter and eggs is very limited, thus causing the glutting of markets at certain times with consequent heavy losses to the producer, and

Whereas the prices by the farmers are not much more than half what they would be with proper cold storage facilities and access to export markets, and

Whereas in the Maritime Provinces the production of beef, bacon, mutton, dairy products and eggs is only a fraction of what it should be, and

Whereas the development of an export trade is the greatest incentive to production, and

Whereas its geographical situation makes Nova Scotia unsurpassed among all the provinces of Canada for export trade, and

Whereas Halifax harbor is one of the finest in the world and offers unexcelled shipping facilities all the year round, and

Whereas Halifax is the Atlantic terminus of the Canadian Government Railway system, and

Whereas this whole problem can only be solved by the erection of a cold storage plant with stockyards and abattoir of sufficient capacity to provide for present needs and future development in the Maritime Provinces as well as the rest of Canada.

Therefore resolved that the Nova Scotia Farmers' Association do hereby petition the Hon. the Minister of Agriculture to appropriate a sufficient sum of money to establish a Cold Storage plant with all necesary equipment at Halifax. Mover, J. Howe Cox; seconder, Wm. O'Brien.

Resolved that the Nova Scotia Farmers Association memorialize the Provincial Government to erect either at the Agricultural College, the Provincial Building, or other appropriate place a fitting tablet commerative of John Young on this, the hundredth anniversary of the appearance of a series of epoch making leters written by him under the pseudonymn of Agricola, which letters were responsible for a development of agriculture in Nova Siotia the influence of which is still apparent throughout the Province of Nova Scotia and to perpetuate his memory by a re-publication of the said letters. Mover, Wm. O'Brien; seconder, Jas. Sedgwick.

Resolved that the N. S. Farmers' Association now assembled in convention at Truro, March 14th, -919, endorse the recommendation of Live Stock Commissioner re the Grading and Inspection of Wool for export and would strongly urge that such legislature be enacted in order to standardize and maintain the reputation of Canadian wool. Moved by S. A. Logan; seconded by Wm. O'Brien.

Resolved that the Nova Scotia Farmers' Association here assembled in anual convention at Truro, March 12th, 13th and 14th, 1919, representing all farmers of Nova Scotia, place itself again on record as being absolutely opposed to the passing of the so called "Daylight Saving Bill," in Canada during the year 1919. As being detrimental to the interest of Nova Scotia farmers and discount any attempt to pass such a Bill because the United States of America, a foreign country, sees fit in its wisdom to pass such a measure, which is opposed by farmers in that country.

And that a copy of this be at once telegraphed to Sir Thomas White, Acting Premier of Canada, and that a copy be at once mailed to each of the Nova Scotia members at Ottawa. Manning Ells, mover; H. S. Kennedy, seconder.

Long resolution asking government to take C. B.. Railways over and make

Abraham Lincoln

who was raised on a farm and had a deep sympathy with farmers, declared a tariff producing sufficient revenue for the support of the general Government and adjusted to protect American industry was "indispensably necessary to the prosperity of the American people."

"I believe if we could have a moderate, carefully adjusted protective tariff, so far acquiesced in as not to be a perpetual subject of political strife, squabbles, changes and uncertainties, it would be better for us."

"The abandonment of the protective policy by the American Government must result in the increase of both useless labor and idleness and so in proportion must produce want and ruin among our people."

Under a national tariff, the United States has prospered and become great. A national tariff is essential to the development of the Dominion. Canada cannot exist if legislation for one section is stretched to a point where it ruins another. A tariff is necessary to our industrial development. Industrial development is necessary to agricultural and general prosperity.

Butter Parchment at Farmer Office

part of the Canadian National Railwys. Read and passed.

Resolved that in the opinion of this Association First Prize animals in the various sections at County and District Exhibitions may be compelled to compete at the Provincial Exhibition at the discretion of the Superintendent of County and District Exhibitions and that the Provincial Legislature be requested to enact legislation to provide ways and means of defraying expenses in connection with such exhibits.

Further resolved that this Association request the Provincial Exhibition Commission to hold their exhibition at such dates as would make such arrangements convenient. Moved by H. A. Moffat; seconded by H. W. Corning.

Resolved that the Nova Scotia Farmers Association in annual session at Truro, March 13th, 1919, claim that the time has come when all farm machinery, including gasoline engines, motor truck and all breakable and wearing parts of farm machinery, should be standardized and that the Dominion Government at once take steps to have manufacturers of farm machinery, motors, etc., meet Dominion Government mechanical experts to carefully classify all farm machinery, motors, etc with a view of eliminating many makes of machinery which now duplicate one another, and standardize the best styles of labor saving farm machinery. Mover, H. S. Kennedy; seconder, Wm. O'Brien.

Resolved that a Committee of three be appointed to draw up regulations for the proper control of scrub sires, particularly bulls and stallions, and to ask the Government to give effect to these recommendations. Mover, H. McPherson; seconder, A. N. Griffin.

We, the members of the Farmers' Association of Nova Scotia in annual convention at Truro, N. S., in March, 1919, are cognizant of the fact that the farmers are not adequately represented in the Government of our Country, and that such representation is very important during the period of readjustment through which this country is passing, in order that the Farmers' interest should be carefully safeguarded.

Therefore, resolved that we should organize for the purpose of securing better representation in Parliament. That we endeavor to have a Farmer electd in each county where farming is the chief industry. Mover, Gup P. Fuller; seconder F. H. Crane.

CO-OPERATIVE DAIRYING A SUCCESS

(Continued from page 712)

they should be milked twice a day at least for the full ten months and milked dry. I often think there must be a lot of very careless milking done in this country as I seldom get a boy or man that can at first milk all the cows in the herd dry even though they have had years if experience. While they will milk the soft-uddered easy ones alright, they generally fall down on any one who happens ti be a meaty-uddered, heavy producer. Some qparters will be fairly dry and others may contain a pint or more after they think they have finished. They don't seem to have been taught to wring a cow out dry and to reach up after the last of it. A good milker in a large dairy herd is a more valuable man that we generally cinsider him and it will pay every owner to go over the cows pretty often after the new hired man, even though he be a thorough man in every other respect. Dairying requires probably a greater measure of skill than any other line of stock farming and will pay handsomely for the same whenever given.

W. M. LEA,
Victoria, P. E. I., March 24, 1919.

Something New by Ingersoll, Maker of Ingersoll Watches

Ingersollite

Real radium makes the Ingersollite glow in the dark and guide you straight to the chain or switch to—turn on the light. No groping—no colliding with furniture. Easy to attach—No tools needed. Can be used on chains, key switches, gas jets or oil lamps.

Sold by progressive dealers.

Ingersoll Watches

The name Ingersoll on the dial guarantees you a watch that has given a better time-keeping service to the people of the world than any other watch, at any price.

Made in Canada, sold at prices to suit every pocketbook. Every watch guaranteed by the maker.

Low cost—fine appearance—sturdy workmanship—correct time keeping. These are the qualities that are built into every Ingersoll watch and that are responsible for 50,000,000 of them being bought, by people of every nation, in the last quarter of a century.

See all the Ingersoll Models at your dealer's.

FEEDING AND CARING FOR A FLOCK OF PURE BRED SHEEP

(Experimental Farms Note)

If the greatest profit is to be realized from a flock of pure bred sheep, they must receive the very best feed and care the shepherd can give them. Not that they of necessity require greater care and feed than the grade, but the fact that the breeder of a pure bred flock expects to put the most of his surplus stock on the market as breeders, means that he must feed the best and give the best care possible, that his stock may reach its best development.

At the Experimental Farm, Nappan, this has been well brought out in the feeding and caring of the pure bred flock. It was found that even during the summer season the pure bred flock could not be neglected, otherwise the results would be bound to show in the following seasons increase and development of the young.

The flock must have a good pasture with not too rank a growth; preferably a short, thick bottom growth with an abundance of clover and plenty of good running water to which the sheep can easily get. Sheep take much more water than the average farmer would think. This holds true, especially in winter.

Just before the breeding season the ewes should be culled; all undesirables taken out; and a certain period given between weaning and breeding time for the ewes to get into condition again. Best results are obtained where the ewes are turned in a nice colver field and flushed just before mating season. It is found that where ewes and rams are in the best of health and condition a greater percentage of twins and triplets are dropped. All ewes should be tagged before the mating season. The best time to breed is in the fall. If you have warm quarters for the ewes and lambs it will pay to have the lambs dropped early; otherwise it is not advisable to do so. It is also found that a small flock of twenty to twenty-five per pen is better than a large one. When ewes go into winter quarters they should be supplied with good, well-cured clover hay. The next best is a mixture of clover and timothy. Pulped turnips at the rate of from 2½ to 3 pounds per head per day should be given up to within a month of lambing, with the addition of ½ to 1 pound of a meal mxture (100 oats, 100 bran and 50 oil cake). This will keep the ewes in a good, thriving condition. For the best results, ewes should not be too fat especially at lambing time. We have had our heaviest losses from over-fat ewes. Just previous to lambing (say about a month) the turnips are gradually cut down to nothing. The percentage of bran, if it is good, is increased slightly until after the lambs are dropped. Then the oats are increased, as there is nothing like good oats to stimulate the milk flow. Salt should be supplied at all seasons of the year. A careful watch over the flock at lambing time will often save the lives of many lambs that will, at the end of six or seven months, be worth $25.00 to $30.00 each.

AGAINST EXPRESS RATE INCREASES

(Continued from page 713)

A Creamery

Interest in the farming sections of the country is diversified.

The Creamery management find it extremely difficult to keep the creamery popular.

The creamery could not compete in prices with B on a butter fat basis.

PRIZE WINNERS AT THE KINGS COUNTY SEED FAIR

The Sixteenth Annul Kings County Seed Fair held under the auspices of the Sussex and Studholm Agricultural Society in the Agricultural School, Sussex, on March 22nd, was the best in the history of Sussex Seed Fairs. S. J. Moore, Maritime Representative of the Federal Seed Division, placed the awards. The increased interest in the production of the various garden and and farm seeds is quite noticable. Mr. Moore, in the course of a few remarks after he had completed judging, pointed out that as seed fairs and field crops competitions were instituted for the stimulating of a greater interest in the production of good seed, the time has arrived when the growers must sow registered seed, in order to take part in competitions. This rule will come into effect next year in New Brunswick. It will be well for our interested growers to be governed accordingly and make provision for the securing of sufficient registered seed to start them on the right track.

The prize winners and the number of entries in the respective classes were as follows:

Wheat, White or Red Fife, 5 entries.—1, W. E. Wallace & Son, Penobsquis; 2, McIntyre Bros., Sussex Corner; 3, W. J. King, Smiths Creek; 4, H. S. Secord & Son, Penobsquis.

Wheat, any other variety, 7 entries.—1, W. H. Vening, Sussex; 2, H. B. Parlee, Sussex; 3, W. F. Mosher & Son, Sussex; 4, H. B. Parlee.

Barley, any variiety, 7 entries.—1, H. B. Parlee; 2, W. H. Venning; 3, W. J. King; 4, W. B. Tamlyn, Newtown.

Oats, and white variety, 15 entries.—1, W. F. Mosher & Son; 2, 4 and 7, W. H. Venning; 3 and 8, W. B. Tamlyn; 5, W. E. Wallace & Son; 6, H. S. Secord & Sons, Penobsquis.

Oats, Black, 2 entries.—1, A. J. Marr, Newtown; 2, H. R. McMonagle, Sussex Corner.

Buckwheat, rough, 6 entries.—1, W. H. Venning; 2, J. F. Roach, Sussex; 3, H. B. Parlee; 4, D. S. Law, Head of Millstream.

Buckwheat, smooth, 2 entries.—1, H. B. Parlee; 2, D. S. Law.

Peas, field, 2 entries.—1, McIntyre Bros.; 2, W. J. King.

Beans, white, 2 entries.—1, H. B. Parlee; 2, J. Titus Barnes, Apohaqui.

Corn, yellow, 1 entry.—1, H. B. Parlee.

Corn, sweet, 2 entries.—1, H. B. Parlee; 2, H. R. McMonagle.

Clover Seed, Common Red, 2 entries.—1, W. H. Venning; 2, Byron McLeod & Son, Penobsquis.

Clover Seed, Alsike, 1 entry.—1, H. W. Venning.

Timothy Seed, 4 entries.—1, McIntyre Bros.; 2, W. H. Venning; 3, D. S. Law.

Potatoes, Green Mountain type, 8 entries.—1, McIntyre Bros.; 2, H. B. Parlee; 3, W. E. Wallace & Son; 3, W. F. Mosher & Son; 5, H. R. McMonagle; 6, Byron McLeod & Son; 7, D. S. Law.

Potatoes, Irish Cobbler type, 6 entries.—1, H. B. Parlee; 2, H. R. McMonagle; 3, W F. Mosher & Son; 4, McIntyre Bros.; 5, W. E. Wallace & Son; 6, H. R. McMonagle.

Potatoes, any White long variety, 1 entry.—H. R. McMonagle.

Potatoes, any Rose variety, 1 entry.—1, McIntyre Bros.

Potatoes, and Red variety, 1 entry.—1, H. R. McMonagle.

Potatoes, any Dark variety, 1 entry.—1, W. F. Mosher & Son.

Six Turnips, any variety for seed growing, 9 entries.—1, H. S. Secord & Son; 2, R. E. McAulay, Sussex; 3, H. R. McMonagle; 4, McIntyre Bros.

Turnip or Swede Seed, 8 entries.—1, R. E. McAuley; 2, McIntyre Bros.; 3, John Knox, Sussex; 4, H. B. Parlee.

Best colection Vegetable Seeds, 3 entries.—1, McIntyre Bros.; 2, H. R. McMonagle; 3, H. B. Parlee.

Oats, from standing Crops competition of 1918, 7 entries.—1, W. F. Mosher & Son; 2, W. H. Venning; 3, H. S Secord & Son;; ', W. E. Wallace & Son.

Wheat, from Standing Crops Competition of 1918, 7 entries.—1, W. E Wallace & Son;2, H. B. Parlee; 3, W. F. Mosher & Son; 4, T. J. Davis, Smiths Creek.

The Auction Sale of first prize grain brought the following prices:,

1 bus. White Fife Wheat	$4.25
1 bus. Marquis Wheat	4.00
1 bus. Six Rowed Barley	2.75
1 bus. Oats, O.A.C. 72	3.00

IF YOU WANT AUTO TIRES

If you want auto tires for small cars it will be well for you to write the Maritime Farmer. We have a splendid non-skid tire to offer our subscribers. It is well worth investigating. The tire is perfect. It is not a second and has a good guarantee behind it. Before you buy new tires for your old car or spare tires for your new car, drop us a line. We have something to tell you which will be of interest. It will pay ou to do this.

MARITIME FARMER REPRESENTS POULTRY ASSOCIATION

At a recent meting of Nova Scotia Poultry Association it was unanimously decided to ask the Maritime Farmer to act as the official organ of the organization. Arrangements have been made whereby the doings of the various branches of the N. S. Poultry Association will be chronicled in the columns of the Maritime Farmer. Every effort will be made to keep branches of the Association in touch with the progress each is making in promoting poultry interests. In other ways, too, the Maritime Farmer hopes to serve the Association.

Let This Engine Save Money on Your Farm

Money saved in labor means greater profits on production. That is the purpose of the "Z" Engine on your farm. It means work done quicker, better and at less cost than by the old methods.

A 6, 3 or 1½ Horse Power

"Z" Engine

does its work day and night at the lowest upkeep cost because of its simplicity of construction and its fuel economy.

No matter for what purpose you want power on your farm investigate the "Z" first—the engine that meets the farmer's needs.

Your local dealer can tell you about the "Z". He sells it; he is the direct representative of the manufacturer and he, personally, stands behind each engine he sells to see that the purchaser gets the fullest satisfaction. Ask your dealer or write today to our nearest office.

Copyright 1919, by The International Syndicate.

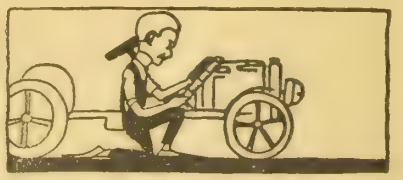
COMPRESSION LEAKS AND ENGINE PERFORMANCE

"Sweet Running" Presupposes Uniform Action Among Cylinder

Smoothness of engine operation is dependent upon uniformity of performance of the individual cylinders. Lack of such uniformity is very noticeable in a four cylinder engine, somewhat less so in a six and comparatively unobtrusive in an eight and twelve. It is more noticeable in all engines as the speed is less and the work is harder. Unequal distribution of the charge and inexact valve action is responsible for considerable such non-uniformity of action among cylinders and the "raggedness" in performance, which it brings about, but differences in the gas tightness of individual cylinders, under compression is the most common cause of such "lame" action. The weak cylinder so often complained of, which causes the characteristic "halting" action so noticeabel during hard, slow pulling is usually a cylinder with very imperfect compression and indeed in extreme cases, the presence of such a cylinder may actually cause a knocking sound—the momentary reduction in crankshaft speed, while it is firing, being sufficient to cause chatterng of the timing gears and the taking up of lost motion in bearings and other parts, similar to that noticed when an actual miss occurs. Cylinder leaks usually come on gradually and, unless compression tests, with the hand crank, are occasionally made, the cause of failing power and lack of "sweet" action may not be realized for some time. Leaky valves, badly fitted pistons and rings and lack of tightness of valve cap, spark-plug and head gaskets all conspire to produce weak compression. Such leaks act in several ways to reduce the activity of a cylinder. During the suction stroke, burned gas may be drawn in through a leaky exhaust valve or past the piston and thus foul the charge. During the compression stroke, a part of the charge taken in is returned to the intake or sent into the exhaust, the crank-ease or the external air reducing the charge which is fired to the proportions of a much throttled charge. Finally, during the power stroke, the escape of gases, reduces the working pressure upon the piston and consequently the power developed. A cylinder suffering with such ailments, necessarily "lags" and the even purring of its engine is destroyed, especially when hard work is called for. If an engine is to be kept in tune and if operative economy is sought, the compression of each cylinder should be frequently tested and, if found wanting, the appropriate remedy should at once be applied, whether it be the grinding in of valves, the provision of tighter rings or the renewing of gaskets under leaky parts.

EFFECT OF SHORT PISTONS ON COMPRESSION

R. H. P. writes: I am rebuilding an engine of obsolete model and the only pistons I can obtain for it are ⅛-inch shorter than they should be, from



wrist pin to head. Using these will, of course, reduce the compression. How much if any will the power be diminished?

Answer: You do not mention what the stroke is. The effect upon compression of this eighth-inch difference will be less in proportion as the stroke is long and vice versa. If the stroke is fairly long and the engine was built sometime ago, when high compression ratios were in vogue, these pistons may prove satisfactory. If the flanges at the bottom of the cylinders are thick enough to possess some excess strength you can perhaps have them accurately milled off slightly, which will tend to raise the piston travel. In some engines having flat piston heads, plates have been riveted on them to decrease the compression space, but this method has some objections. Why don't you try these pistons and, if they make the compression too low, adopt some of these expediments? Quite likely they may work well as they are.

SLOW LEAKS IN TIRES

S. C. asks: Why is it that I have so much trouble from the tires of my car getting soft? It seems to me that I pump them twice as often as other

Greater Strength and One-Quarter the Cost

FOR the heavy work rope traces are stronger and will wear longer. In rough work leather traces are stiff and get scraped; or they rip. Griffith Giant Rope Traces are flexible, can be slipped on in a jiffy and will not break. Remember, they are, by actual service tests, proven stronger than leather.

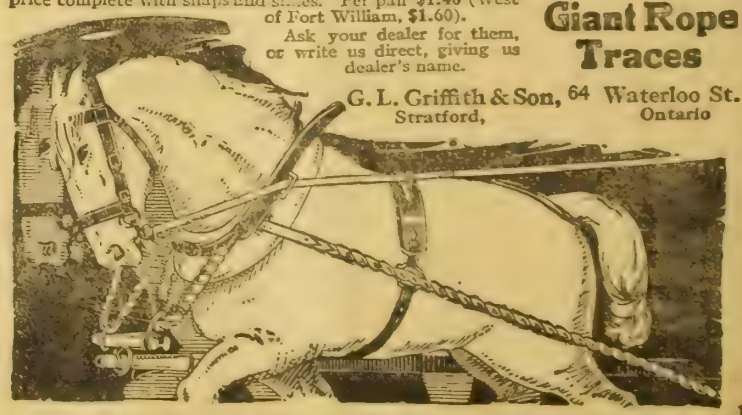
Giant Rope Traces are complete with malleable iron ends and electrically welded steel chains; either 7/8 inch for farming or 1 inch for lumbering. Price complete with 7/8 inch rope, set of four $6.00. (West of Fort William $6.50) 1 inch size $6.50. (West of Fort William $7.00.)

Griffith's Giant Yoke Ropes to replace leather pole-straps; price complete with snaps and slides. Per pair $1.40 (West of Fort William, $1.60).

Ask your dealer for them, or write us direct, giving us dealer's name.

Griffith Giant Rope Traces

G. L. Griffith & Son, 64 Waterloo St. Stratford, Ontario



people. There seem to be no real punctures.

Answer: Most likely because the plungers in the valves are leaky. These have to be changed frequently,

as the seat is very small and wear out rapidly. The old plunger is removed by screwing it out, using the slotted end of the valve cap as a spanner and the new plunger is screwed into place with the same tool. It should be seated firmly and a cap, with a good rubber packing, should be used over it. It is possible that some of your inner tubes have developed very slight leaks and you can assume this to be the case, if renewing the valve plungers does not prevent the premature deflation of your tires.

ELECTRIC STARTER HINTS

Careful Usage Reduces Repairs Here As Everywhere Else

The following suggestions relate to the use of starters, especially to those in the operation of which a motor gear has to be meshed with the flywheel gear: Do not force the starting operation by jamming down the pedal abruptly. Do it gently, especially at the last of the movement and, if the gears do not engage readily, let the pedal back and go through the operation again. Avoid holding down the pedal atfer the engine is running under its own power, as the over-running clutch mechanism which is then called into action, is not intended for anything but momentary operation. Under no conditions operate the starter, when the engine is running, as the bringing together of the gears under these conditions will most certainly burr or strip the teeth. This caution may seem unnecessary, but a meddlesome person or a careless operator may do it One may forget that the motor is running or, in a very noisy place, may think that it has stopped when this is not the case. A touch upon the accelerator will always indicate whether or not the engine is in operation. It is inadvisable to operate the starter with the spark too far advanced, even though a safety device is provided to guard against damage from "back kicks." Throwing out the clutch, considerably lessens the load on the starter motor, when a car is cold, particularly if the gearbox lubricant is very stiff. Do not allow the mechanism of the motor-pinion engaging drive to become sluggish in action from the presence upon it of gummy oil. It should work freely. Starter connections, the switch, commutator and brushes have to carry very large currents and they should be kept tight and clean at all times. Be sure that the alignmetn of the starter-pinion wtih the flywheel gear does not become faulty. Do not make the starter spin the motor more than half a minute at a time. Verify carburation and ignition conditions before trying it again.

EXCESSIVE FUEL SUPPLY

J. H. G. asks: Can you tell me the cause of the following trouble: My en-

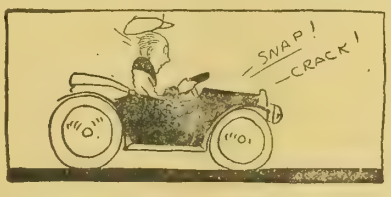
gine will not speed up and it seems to be choked all the time? It does not fire regularly and, thinking the spark was at fault, I took out the plugs, and found them badly sooted, but the spark proved to be as strong as ever. The carburetor has had nothing done to it recently.

Answer: It looks as though your engine is getting too much gasoline and not enough air. If you carburetor has an auxiliary air valve, designed to open as the engine speeds up, you better inspect it and see that it is not stuck in the closed position. If it is, this accounts for your trouble. Many cars have a strangler or choker, which is used to close the carburetor air-intake when starting and perhaps the mechanism which operates this has gone wrong, so that it stays closed. Be sure that this air passage is free. Sometimes there is valve trouble in the vacuum feed tank which causes gasoline to be sucked directly into the intake manifold. Possibly the needle-valve adjustment of your carburetor has worked loose and opened the spraying nozzle too wide.

LOST MOTION IN TRANSMISSION SYSTEM

A. W. P. writes: Sometimes, when I start my car into moton, I notice quite a loud "snap" and a slight jerk, neither of which ever occurred until lately. Does this indicate that something is wrong?

Answer: The cause of this is well worth looking into and removal before its effects become any more marked. Probably, lost motion has developed in some of the transmission parts as the result of wear. So long as the engine is delivering power to the wheels, this looseness is kept taken up but, when the brakes are applied, it is developed so that, when you apply the clutch, certain parts move



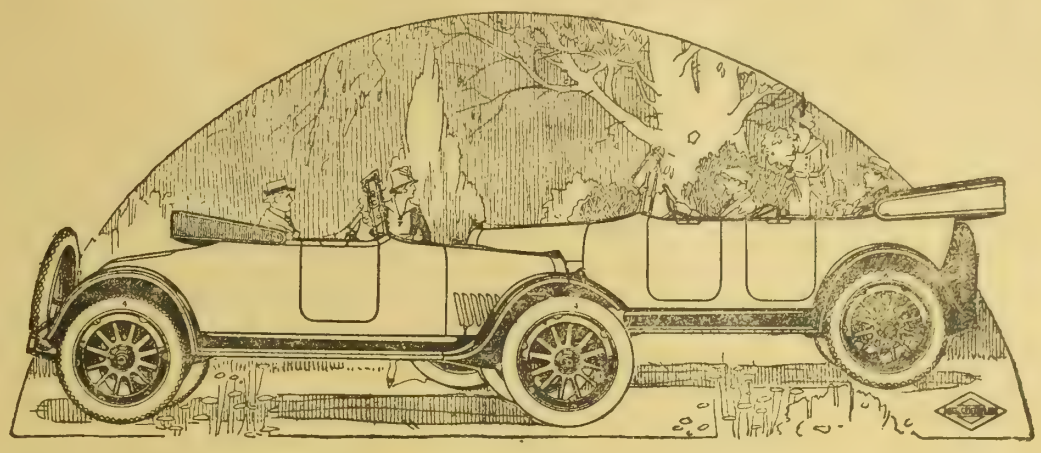
freely for a short distance and then take up the driving load suddenly with the noise and jerk which you notice. If you can expose the driven clutch member to view, try pushing the car alternately back and forth upon the garage floor and see if there is a period in the car movement when the clutch does not revolve. If there is, there is lost motion in the transmission, universal joints, final drive gears, driving wheel connections or elsewhere, which ought to be removed.

MAKING CRANKSHAFT REPLACEMENT

S. J. G. writes: The crankshaft of my 1916 —— car is broken. Please tell me how to remove and replace it myself. Is it necessary to get a new shaft or can the old one be repaired?

Answer: Unless you have regular repair shop facilities, this will be a pretty hard job. The best way is to lift the power plant right out of the frame, after breaking all the connections, and rest it upon convenient horses. Remove the clutch and transmission and detach the main and connecting rod bearings, which will free the shaft and fly-wheel. Detach the latter and fit it to the new shaft. You will have to "scrape in" the main bearings to fit them properly and then assemble. Crank shafts can be electrically butt welded, but special fittings and very accurate workmanship are required and the process is expensive and none too certain of success. We advise you to buy a new shaft. Perhaps you can obtain one in good condition and at a reasonable price, from one of the wrecking companies. As we say above, this is really a job for the professional mechanic.

NEW GASOLINE AND TIRE MILEAGE RECORDS
ESTABLISHED BY THE
McLAUGHLIN
LIGHT-SIX



Economy and stability of the McLaughlin Light Six is due to the fine balance struck between power and burden. There is not a pound of unnecessary weight nor is it impoverished of a pound that could contribute to its efficiency or its life.

Power, with the famous forty-four horse power valve-in-head Light Six engine, and roomy body in open and closed models set a new standard of value in Canadian built cars. Owners of this model get from 25 to 30 miles to the gallon of gasoline and from 8,000 to 12,000 miles on tires.

THE CATTLE MARKET

Montreal, March 29.—At the Canadian Pacific Live Stock Market the offerings for sale today amounted to 125 cattle, 30 sheep and lambs, 300 hogs and 650 calves. On account of the continued limited supplies of cattle coming forward here, and the scarcity of the top grades a very firm feeling continues to prevail in the market and prices today were fully maintained at the late advance noted. The demand was fair for small lots to meet immediate wants, and with the carryover from Monday and the above number offered, buyers had no difficulty in filling their wants with the quality of stock available, which consisted principally of common and medium grades. An odd good steer sold at $14.50, but the bulk of the trade steers was done at from $9 to $13, while a few choice light butcher's cows brought $11, and the lower grades from that down to $6, and some choice light bulls realized $11, and the commoner stock sold from that down to $6 per 100 lbs. The trade in canning cattle was dull owning to the fact that the bulk of them have been marketed, and the season is now over.

One of the features of the small meat trade was the offerings of a few spring lambs, and as the quality of some of them was choice, weighing from 30 to 40 lbs. each they met with a ready sale at $15 to $16 each. Another feature of this market was the weaker feeling in hogs, and prices were 50c per 100 lbs. lower than on Monday, with sales of selected lots at $19.50, and lots weighing less than 140 lbs. each at $17.50 per 100 lbs., weighed off cars. A few yearling lambs sold at $13 to $15 per 100 lbs. The demand for calves was good, and an active trade was done in this line. The quality of the offerings on the whole was better than they were last week, and as the suply was not in excess of the requirements prices maintained were at from $8 to $15 per 100 lbs., as to quality.

Grow Your Own Vegetables!

There's Money, Health and Pleasure In It

If ever a garden was worth while, it is NOW, when the cost of food is so high. Even a little plot, well cultivated, will supply a most surprising quantity of delicious, healthful food, and reduce grocery bills in a way that will make you smile.

But you should start right—and the first step is the choice of seeds. Buy

EWING'S SEEDS

and you will have gone far toward ensuring generous crops of choice quality.

Ewing's "Early Gradus" Pea

The most popular extra early wrinkled pea. About 30 inches high; bright green pods 4 inches long or more, well filled. Highest table quality. Lb. 50c; ¼ lb. 20c. Sent postage paid — cash with order.

Ewing's Seeds have a 45 year record in Canada that proves them clean, vigorous, true to type, and sure to grow. All the newest strains, as well as the old standbys.

Write for our Illustrated Catalogue, and if your dealer hasn't Ewing's Seeds, order from us direct.

Massey-Harris

For Spring Plowing

You take no chances when you buy a MASSEY-HARRIS PLOW—it has stood the test of time. You get a Plow it is a pleasure to handle, and that does the kind of plowing you can be proud of. It cleans readily, turns and covers perfectly, and gives all-round satisfaction.

The excellent scouring qualities of the Massey-Harris Plows enables you to get on the land and get your ground plowed earlier than with other Plows. This is an important matter, especially in the North-West, where a few days delay may mean the loss of a crop. They are light draft and easy to handle.

Durability is another of the strong points of the Massey-Harris Plows. The improved methods of tempering the Steel Mouldboards and Shares, and of hardening Cast Shares, together with careful erecting and rigid inspection of all Plows, combine to produce a line of Plows which look well, work well, and wear well.

Walking Plows, Riding Plows, Disc Plows, Engine Gang Plows, etc., in many Styles and Sizes.

DAIRY PRODUCE TRADE

Montreal, March 29.—The receipts of butter today were 1,254 packages, as compared with 104 for the same day last week, anad 127 for the corresponding date a year ago. The tone of the market remains very firm on account of the continued scarcity and the steady demand for small lots, and sales of the best grades of creamery were made at 59c to 61c per lb. in a wholesale way, and jobbing prices were also unchanged at 61c per lb. in 1 lb. blocks and at 60c in solid packages. An easier feeling prevailed in the New York market on Tuesday which was attributed to the loss of consumptive demand owing to the very high retail prices, and this created a nervous feeling in the trade which resulted in some shading of values. Sales of extra creamery were made at 64½ to 65c, and 93 score at 65½c per lb.

We quote wholsale jobbing prices as follows:
Finest creamery, solids....00c to 60c
Finest creamery, blocks...00c to 61c
Fine creamery, solids.....58c to 59c

The receipts of cheese today were 136 boxes, as against 104 for the same day last week and 98 for the corresponding date a year ago. There was nothing new in the market to note. The demand from domestic buyers for smal lots was steady and sales were made at 27c to 27½c per lb. but apart from this the market was dull.

The following prices are being paid by the Commission:
No. 1 cheese.....25c
No. 2 cheese.....24½c
No. 3 cheese.....24c

New York, March 26.—Butter lower. Receipts, 1,168 tubs. Creamery, higher than extras, 62½c to 63c; creamery extras, 92 score, 61½c to 62c; firsts, 59c to 61c; packing stock, current make, No. 2, 44½c to 45c. Cheese irregular. Receipts, 6,071 boxes. State, whole milk, flats, curent make, specials, 33½c to 34c; do. average run 33½c to 34¼c.

WINNIPEG GRAIN PRICES

Winnipeg, March 29—Messrs. Baird & Batterell wired Shearson, Hammill & Co. the following:

Oats—Market was decidedly weak during the entrie session and, although American corn and oats scored substantial advances during the early part of the session and the local element was bullish, endeavoring to advance prices in this market, in sympathy with the action of American grains, their efforts were futile.

Our western correspondents have advices that farmers are holding barely and oats and are unwilling to dispose of the balance of their crop at present prices. Spring is at hand, and it is only a few weeks before we will begin to harvest new oats in the extreme south of the United States and famine prices exist on all foodstuffs when there is an abunndance of it in the world.

Barley—Sharply lower. The buying of this recently has been in anticipation of the foreign demand, which apparently has not been realized to any extent and when buyers of bar-

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $ 1.75 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

ley endeavored to dispose of their holdings this morning they found the market bare of buyers with the cash handlers unable to dispose of their stocks for shipment either to the east or for export.

Flax—Trade very light with no particular feature. This is one commodity that might have merit at present levels, if the demand for oil sprung, because the stocks of flax in America are exceedingly small, but further enahncement in value of this commodity will be dependant on the inability of Argentina to export to America a portion of her surplus.

Fluctuations in grain today were:

Oats				
May ...	.74¼	.74¾	.72⅝	.72⅝
July ...	.74¼	.74¾	.72⅞	.73
Barley				
May ...	$1.05	$1.05	$1.00⅞	$1.01
Flax				
May ...	$3.54½	$3.56¾	$3.53	$3.53
July ...	3.43½	3.45	3.40	3.40

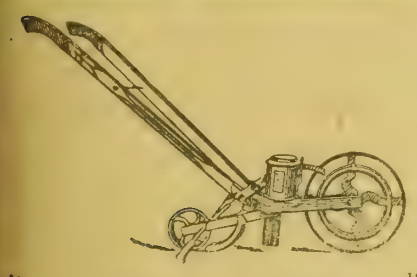
Cash prices closed:

Oats—No. 2. C.W., 71⅝c; No. 3 C.W., 67⅝c; extra No. 1 feed, 67⅝c; No. 1 feed, 65⅝c; No. 2 feed, 62⅝c.

Barley—No. 3 C.W., 99½c; No. 4. C.W., 94c; rejected, 90c; feed 89c.

Flax—No. 1 N.W.C., $3.57; No. 2 C.W., $3.48; No. 3, C.W. $3.33.

GARDEN SEEDERS!



A DANDY FOR TURNIPS

Makes the drill, sows, covers and rolls the seed while you walk. Does the work of two men in half the time. No better seeder built for the accurate sowing of turnip, carrot, cabbage, beet, pea, corn and all other kinds of garden eseds.

Price $10.50 Delivered at Your Station. Order To-day.

The Sussex Mfg. Co., Limited
Sussex, N. B.

CHICAGO GRAIN MARKET

Chicago, March 29.—All deliveries of corn soared today to new high price records for the season, but reacted sharply at the last. Gossip had been current that the seaboard exporters were bidding, and this factor was afterward more or less offset by bearish advices from Argentina. The market closed nervous at the same as yesterday's finish to ½c higher, with May at $1.48¾ to $1.48⅞, and July at $1,38⅞ to $1.39. Oats lost ¾c to ½c. Corn traders showed themselves extremely susceptible to bullish influences, such as the gossip about export inquiry. The underlying reason was that no domestic stocks to speak of were ready available, and that no movement of consequence was expected until after corn planting had been accomplished. After the resultant bulge in prices, however, the wave of buying orders became exhausted and prices swung backward with longs, in general, striving to realize. The immediate bearish impetus in the late day was a sudden fall in quotations at Buenos Aires, together with an estimate that the Argentine exportable surplus would reach 230,000,000 to 250,00,000 bushels.

MILLFEED AND ROLLED OATS

Montreal, March 29.—There was no further change in the condition of the market for for millfeed today, prices being maintained for all lines, but the volume of business was smaller and the market quieter on account of the great scarcity of some feeds which are in urgent request. Sales of feed cornmeal in mixed car lots were made at $64, mixed grain mouille at $58 to $60, pure ground oats at $58, mixed mouille at $50 to $52, dairy feed at $46, oat middlings at $44, bran at $41 to $42, shorts at $44 to $46 per ton, including bags, delivered to the trade, and car lots of bran were quoted at $40.25, and shorts at $42.25 per ton, including bags, ex track. The trade in rolled oats was dull and prices ruled steady for broken lots of standard grades at $3.90 to $4 per bag of 90 lbs., and Golden Cornmeal sold at $4.50 to $4.75 per bag.

THE BALED HAY MARKET

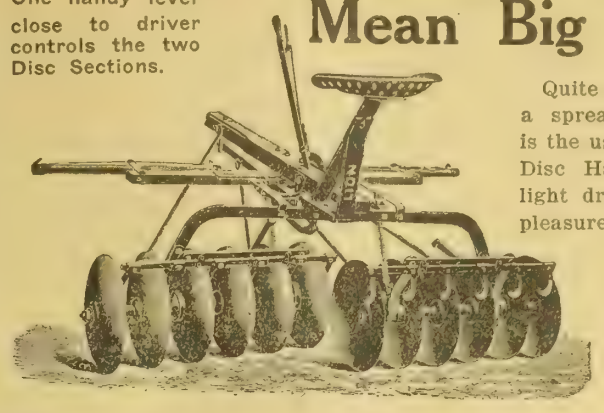
Montreal, March 29.—A very firm feeling prevails in the market for baled hay at the recent advance in prices noted, owing to the very limited supplies coming forward and the good demand for supplies for export and domestic account, and sales of car lot s of No. 1 timothy hay were made at $26, No. 1 light clover mixed hay at $25, No. 2 timothy hay at $25, No. 2 clover mixed hay at $24, and No. 3 timothy hay at $23 per ton extrack.

THE PROVISION MARKET

Montreal, March 29.—A weaker feeling has developed in the Canadian live hog situation since Monday, which resulted in prices declining at Toronto yesterday 25c to 50c per 100 lbs. as compared with those paid last Saturday, with sales at $19.75 to $20 per 100 lbs., weighed off cars, and at $19.50 to $19.75 fed and watered. In sympathy with the above outside prices here today were 50c per 100 lbs. lower than Monday. The offerings were not large and the demand was ample to absorb them, consequently a fair trade was done in selected lots at $19.50, and in lots weighing less than 140 lbs. each at $17.50 per 100 lbs. weighed off cars. Owing to the above there was an easier feeling in the market for dresed hogs, and sales of city abbattoir fresh-killed stock in a jobbing way were made at $26.50 to $27 and country dressed ilght weights at $25 per 100 lbs.

Frost & Wood Disc Harrows Mean Big Crops

One handy lever close to driver controls the two Disc Sections.



Quite as important as a spread of fertilizer is the use of a F. & W. Disc Harrow, and its light draft makes it a pleasure to use.

The value of a good seed bed cannot be over-stated. Take no chances THIS year.

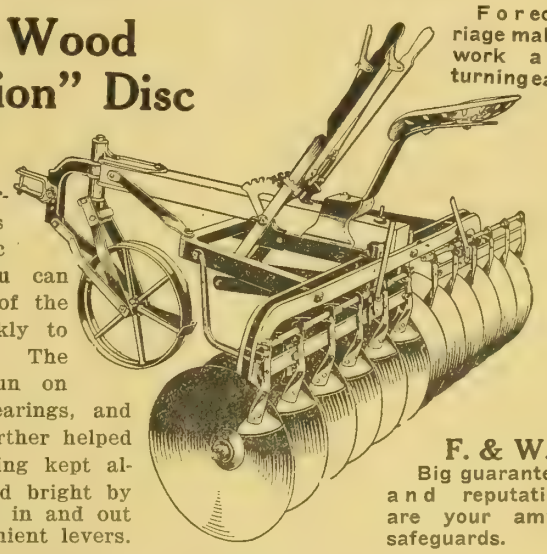
Frost & Wood "Lion" Disc Harrow

A staunch in-throw Harrow; the two disc sections held in place by an immensely storng main frame of steel are run on highly polished, dust-proof ball bearings. The angle of the "cut" is controlled by a handy lever. The inside discs are kept into the soil by strong springs. Driver's seat is well back so as to lessen neck-weight on horses, meaning extra light draft. Two sizes, 12 and 15 discs.

See Your Nearest Frost & Wood Dealer
He'll gladly show you these splendid Harrows and other modern implements in the relable "F. & W." line.

Work as hard as you please
Its light draft and staunch build enable you to tackle the roughest field. Be sure to see it.

Frost & Wood "Champion" Disc Harrow



For ecarriage makes work and turning easy

Two easily operated handy levers control the disc sections, so you can vary the "cut" of the discs very quickly to suit the ground. The disc sections run on splendid ball bearings, and light draft is further helped by the discs being kept always clean and bright by scrapers, thrown in and out of use by convenient levers.

F. & W.
Big guarantees and reputation, are your ample safeguards.

Immense strength, and high quality materials, ensure few repairs and year-in-year-out readiness for work.

The FROST & WOOD CO., Limited
Truro ST. JOHN Charlottetown

MILL FEEDS ARE SCARCE

Mill feeds are very scarce. The flour mills are operating at their capacity and bran and shorts are almost impossible to get. It is not necessary, however, to depend on bran and shorts for feeding purposes. There are many feeds on the market which are not only just as good as bran and shorts, but even better. If you are having trouble in getting feeds, write the Maritime Farmer. We will help you get all the feeds you want at WHOLESALE PRICES. You can buy just as cheap as any dealer, through the Maritime Farmer. We handled 150 cars of feed this year for farmer organizations. We can handle more, if you want feed. We address these remarks to agricultural societies throughout the Maritime Provinces.

CELERY CULTURE

Celery is a moisture-loving plant and does well especially in muck soils, although excellent celery can be grown on ordinary garden loam of a lighter character more especially if moist. The plants are slow to develop in their early stages. For a late crop the seed should be sown from the middle to the patter part of April. The old plan of digging a trench is not now practiced by commercial celery growers. It is considered better to grow the crop on the level and mould up the soil, or to blanch the crop by means of boards or pliable blanching material resembling "ready roofing" which may be used to keep the plants together and exclude the light. This subject, as well as onion culture and asparagus culture, is quite fully lovered in Pamphlet No. 24 of the Central Experimentaal Farm, available at the Publications Branch of the Department of Agriculture, at Ottawa.

When the farmer desires to sell a heavy horse of quality and breeding he can always locate a ready market, whereas inferior animals ordinarily can be disposed of only at a sacrifice.

NEW BRUNSWICK'S FARMERS AND DAIRYMEN'S CONVENTION

(Continued from page 711)

by using a grade . Two regrettable features about using pure bred sires are that in many cases it is impossible for purchasers to get any reliable information regarding the milk producing qaulities of the dams of the animals offered for sale; and that too many dairymen apparently do not realize the importance or value of knowing something about the milk producing qualities of the sire's ancestors.

Be it therefore resolved that this Dominion Dairy conference regrets the fact that many breeders of pure bred dairy stock do not keep records of the milk and fat produced by each cow, and are therefore unable or unwilling to provide purchasers of pure bred dairy cattle with this most valuable information, with the result that farmers often purchase pure bred dairy sires expecting to improve the milk producing qualities of their herds, but fail to get results because the animals are bred from low milk producing stock.

We, therefore, recommend that a special effort be made to the Dairy Schools, Dairy Instructors, Dairymen's Conventions and other suitable avenues, to place before the milk producers of Canada the importance of buying pure bred dairy sires from only the breeders who can show reliable records of the milk and fat produced by the dams of the animals offered for sale."

Resloved that this Association concur in the spirit of the above resolution recently passed at the National Dairy Convention at Ottawa.—D. J. Mundle, A. J. Doucett.

Whereas the Government of this Province is desirous of promoting the Livestock industry, especially sheep raising,

And whereas there now exists upon the statute books a law protecting the sheep owner from loss of sheep by dogs,

And whereas large numbers of deer are also destroyed each winter by wild cats,

And whereas the number of wild cats is steadily increasing while the number of deer is steadily decreasing this decrease being caused largely by the depredations of wild cats.

Be it resolved by the Farmers and Dairymen's Association here assembled that we petition the Provincial Legislature now in session to amend the game law of the Province now in force so as to increase the bounty on wlid cats from two dollars to the sum of not less than five dollars per head.

And also be it further resolved that a acopy of this resolution be forwarded to his Honor the Minister of Lands and Mines, and a copy to his Honor the Minister of Agriculture.—L. T. Leaman, C. B. Keith.

Resolved that we, the Farmers of New Brunswick, in Convention assembled do hereby endorse the action taken by the Provincial Legislature of Manitoba and Saskatchewan in requesting the Federal Government to adopt the reciprocity compact formerly proposed between Canada and the United States and humbly request our Legislature to do likewise.—J. E. Porter, H. H. Smith.

Resolved that this Convention of the Farmers' and Dairymen's Association of New Brunswick concur in the resolution adopted by the Boards of Trade of St. John and Moncton protesting against the proposed removal of the office of the Canadian National Railways from the City of Moncton.—A. J. Doucett, C. B. Keith.

Wherease we believe a great number of bredeers of pure brd stock for breding purposes in this Province have lost sight of individuality for pedigree and also that the attention is not givei to care and feeding for development that should be in many cases,

Therefore resloved that the Farmers' and Dairymen's Convention draw this matter to the attention of the breeders and advise them to pay more attention to selection of individuals for performance as well as for certain lines of pedigree and that more care be given to the development of young stock which is being reared for breeding purposes.—D. B. McKinnon, C. B. Keith.

Whereas it is aparent that a number of Vice-Presidents of the Association are present at this Convention, having travelled at their own expense

And whereas there seems to be no provisions made for the re-imbursement of these expenses,

Therefore be it resolved that this Convention submit the matter to the Department of Agriculture for their kindly consideration.—Scott A. Shaw.

METHODS FOR INCREASING THE YIELD OF OATS

By O. C. Hicks, B. S. A.

Oats constitute the most important grain crop of the province of New Brunswick. According to the statistics for different crops taken from the report of the Department of Agriculture, the average annual production fo rthe past ten years was 5,837,243 bus.

The yield per acre for the same period was 28.5 bus. This yield is low and efforts should be made to increase it. Better methods of culture, the use of more productive varieties for seed purposes and seed treatment for the prevention of smut, will aid materially in increasing the yield per acre and the profit to growers.

The average annual importation of oats and mill feeds into the province before the beginning of the war was valued at $1,900,00. Owing to the rise in prices and to increased freight rates this ameunt was greatly increased during the past four years. Theer are several reasons why an increased area of oats should be sown.

Firstly, there is a large yearly importation of oats for feeding and seeding purposes, which under average weather conditions could as well be grown at home.

Secondly, with every bushel of imported feed oats used, the number and variety of weeds on our farms is increased, which makes the farms more difficult and expensive to operate in after years.

Thirdly, our climate and soil conditions are such that oats is a crop which we can grow at a profit, as it fits so well with the many systems of crop rotation in use and is the crop

You Can Examine

INVINCIBLE FENCING

Before you buy it

INVINCIBLE Fencing reaches the farmers through the most economical channels of manufacture and distribution. The steel for the wire is made in our own mills—and so is the wire for the finished product. Thus we ensure a quality of raw material in keeping with our high standard, as well as eliminating unnecessary profits. Then we distribute Invincible Fencing through dealers, which has been proved to be the most economical and satisfactory method.

From these Invincible dealers—the best dealers all over Canada—you can obtain immediate delivery; no waiting for shipments, no sending your money before you can see the goods.

You do not have to take our word for the high quality of Invincible Fencing—you can examine it at your local store. You may check its weight, see the straightness of the stays, note the heavy galvanizing, observe the perfection of its weave and test the strength of its locks.

Do this—then buy on your own good judgment—this fencing that is made by Canadian workmen—and keep your money in circulation in Canada.

which we can compete with the grain growing areas of Canada.

One of the reasons for the low yield per acre is because of the lack of attention given to the selection, purchase, and preparation of the seed used. Too frequently the seed is not graded but sown just as it comes from the thresher. An investigation made in the Province in 1914 showed that only on 38% of the farms were the oats cleaned to remove the weed seeds and light kernels. On none of the farms were the oats treated with formaldehyde to prevent smut. Neglect of these two precautions is responsible for a large acreage of oats being grown at a loss.

Repeated experiments at Guelph, Ottawa and at MacDonald College show that plump large seed give a substantial increase in the number of bushels harvested over ordinary marketable types of oats.

The increase in the yield of oats treated with formaldehyde to prevent smut is borne out by the following data: Mr. Wm. Palmer, Keswick, a member of the Canadian Seed Growers Association, treated one portion of his first generation registered Banner oats to prevent smut and sowed the remaining part without the Formaldehyde treatment. On inspection the part treated was practically free from smut heads, while the untreated part contained 5%. The loss on this crop therefore was 2½ bus. per acre.

Mr. Albert Tracy, Secretary of Agricutlural Society No. 116, Fredericton Jct., treated 27 bushels of seed oats for smut prevention in the spring of 1918, and reported for Banner Oats, a yield of 14 bushels from one, and from another variety, 15 bushels from one.

On the other hand Mr. Wm. Hayes of Millville reported a yield of 750 bus. of oats from 110 bus. sowed, a yield of 7 bus. from one. This low yield Mr. Hayes said, was due to an excessive amount of smut heads, estimated by himself to be 25%. The loss in this instance amounted to 250 bus. of oats as 1000 bushels at least was expected.

Most of our best varieties of oats have been brought from Europe where more attention has been given to the improvement of the crop than in this country. These varieties do best here however, when grown under conditions similar to those in the regions where they were developed, consequently a good variety originated in Sweden or Scotland can be expected to give better results than one originated in Russia. It has been found repeatedly with various plants that varieties originated in one locality and adapted to one set of conditions, when removed to a different locality where different conditions prevail, may give indifferent results or fail completely.

A change o fseed is by no means the surest step to take in the desire to increase the acre yield, indeed, it is usually the wiser course to clean and grade up one's one seed than to make such a change, unless a superior variety is being secured.

In addition to the fanning mill selection the farmer can increase the yield and the quality of the oats he grows by selecting the best heads or the best plants in the field. This is the system of improvement adopted by the Canadian Seed Grower's Association to produce what is known as 'Registered' Seed. The extensive experiences of oat breeders in various parts of the world have demonstrated that we can greatly improve our varieties by careful breeding. For instance in Ontario today the O. A. C. No. 72 (a selection from Siberian) is the most outstanding variety. It is the heaviest yielder, and is veyr resistant to smut.

The most reliable method of improving the quality and yield of the oat crop is by the selecting and testing of strains developed from individual plants or heads. It is probable that several sports or mutations of oat plants are produced every year in the province any one of which is observed and propagated without any further selection would form a valuable new variety, possibly superior to any we now have.

Varieties are frequently very much mixed with different types, and growers ordinarily fail to observe this mixture. Almost all farmers think they know a good oat plant, though it requires keen observation to recognize different qualities such as size of head, yield of grain, strength of straw, number of stools, etc. The grower should be on the lookout for desirable plants. These should be marked and later on the seed gathered and placed in separate paper envelopes.

Each selection should be planted separately in a short row—with a few rows of standard varieties alongside for comparison.

When the selections begin to ripen, note the season of maturing, the tendency to lodging, presence of such diseases as rust and smut and whether the selections have a tendency to shatter the seeds.

Retain the superior good rows, and discard all rows which are apparently inferior in yield or are badly affected with any disease or subject to lodging, etc.

The next year an increase plot can be sown of the row chosen as the best. It is remarkable how rapidly seed can be increased from a small beginning. A single head of oats may yield 50 bus. within 3 years time. The former should take advantage of this generous quality of nature. Seed selected from grain crops will yield an abundant increase in a surprisingly short time and the yield of farm crops can be greatly increased by the use of well bred seed.

The hybridization of oats is a different process and the selection of hybrids and the fixation of pure types is a problem which should be left to the professional plant breeder and experiment stations. Much can be done in the improvement of the oat crop through the selection of the best individual plants to increase the yield. Greater results can be secured as a first step by cleaning and grading all oats use dfor seed and still further advancement be made toward securing a maximum yield by field selection followed by a rigid fanning mill selection and by treating the seed with formalin to prevent the loss caused by smut.

Large, plump seeds give better results than small seeds. This is especially true of garden seeds.

Do not leave seedlings in the seed box to become crowded. Transplant as soon as largn enough to handle, if you would have good plants.

The best of garden seed is the cheapest in the long run. Demand seed not of low cost but of high quality.

An English gardener says that salsify or vegetable oyster sprouts that come up from plants left in the garden over winter may be cooked and used like asparagus if they are not allowed to grow more than six inches tall.

Splendid Record Achieved during 1918

THE year 1918 was for the business of life assurance a year of supreme achievement. Owing to the combined effect of the war and the influenza epidemic, death claims were unusually high. The payment of these claims enabled the Companies to render an unprecedented measure of public service, and to fulfill to a more noteworthy degree than ever previously the beneficent purpose for which they were founded.

The record achieved during 1918 by the Sun Life of Canada was one of particularly striking success. For the first time in the Company's history new assurances paid for exceeded Fifty Million Dollars. The growth in size, strength and prosperity accentuates the Company's position as not merely the leader among Canadian Life offices, but one of the great insurance corporations of the world.

The Company's financial power is emphasized by its large Assets, Income and Surplus. During the year $7,460,000 was added to the Assets, which at December 31st, had reached the huge total of $97,620,000. The Income is now $21,651,000, while the undivided Surplus is $8,027,000.

THE RESULTS FOR 1918

ASSETS

Assets as at 31st December, 1918	$97,620,378.85
Increase over 1917	7,460,204.61

INCOME

Cash Income from Premiums, Interest, Rents, etc., in 1918	21,651,099.69
Increase over 1917	2,362,102.01

PROFITS PAID OR ALLOTTED

Profits Paid or Allotted to Policyholders in 1918	1,546,607.16

SURPLUS

Total Surplus 31st December, 1918, over all liabilities and capital (According to the Company's Standard which is more severe than that laid down by the Insurance Act.)	8,027,378,55

TOTAL PAYMENTS TO POLICYHOLDERS

Death Claims, Matured Endowments, Profits, etc. during, 1918	9,768,564.28
Payments to Policyholders since organization	78,862,881,15

ASSURANCES ISSUED DURING 1918

Assurances issued and paid for in cash during 1918	51,591,392,04
Increase over 1917	3,779,824.56

BUSINESS IN FORCE

Life Assurance in force 31st December, 1918	340,809,656.13
Increase over 1917	28,938,710.42

THE COMPANY'S GROWTH

BEST ANNUALS FOR THE HOME GARDEN

(Experimental Farms Note)

Annual flowers succeed exceptionally well in nearly all parts of Canada. For the "Home Garden," whether it be in the city or the country, the best annuals are the old favorites which have become so popular because they have fitted in with the needs of a large class of flower lovers. The reason for the popularity of the "annual" is that it can be raised easily and grown with but very little expense or labor. A few packages of seed costing five or ten cents each, a garden patch and someone interested in flowers form a combination which in the sapce of four or five short months may produce the most delightful results.

The old favorite annuals are the best because they have stood the test of time. In addition, they have been improved and incrased in size, form and color by the plant hybridist and by the seedsman so that today they have almost reached perfection. In one hundred years or less they have made as much advance as most other forms of life have made in several thousand. The "poor man's orchid" is the descriptive term for the modern sweet pea and the term is legitimate because the sweet pea of today is wonderful. It is a new creation as compared with the sweet pea of a century ago. The same is true of many other annuals.

The favorite annuals are those which can be depended upon to give results. Th efinal results will depend upon: 1, seed; 2, culture.

1.—Seed. Some annuals are difficult to raise from seed and, therefore, the best for the home garden are those which produce seed that will germinate well. The seed of such annuals can be dealt with in two ways: (a) It may be sown in pots or flats in the house and the seedlings transplanted to the garden or (b) it may be sown direct into the garden. Latitude and climate must settle which method is better for the greatest success although with many annuals either method might give good results.

2.—Culture.—The culture of an annual flower is not a laborios task or trial of skill. The cultural directions are generally printed on the seed packages. Soil, cultivation and rainfalls are three ifactors of importance. SoiSl should be of garden loam quality, and neither too sandy nor too heacy. Barnyard manure will stimulate good growth. Cultivation will keep the growth vigorous and healthy. Rain or artificial watering not less than once a week in the early stages of growth is almost essential.

Annuals are splendid for purposes of cut bloom. Some of the best for this purpose as well as for garden display are as follows: China Asters, Sweet ePas, Nasturtiums, Sweet Sultan, Sweet Scabious, Snapdragons, Everlastings, Zinnias, Pot Marigold or Calendula.

Other good anuals are:

LOW GROWING—Pansies, California Poppy, Mignonette, Petunias, Portulaca, Pinks, Drummond Phlox, Verbenas.

MEDIUM HEIGHT. — Everlastings, Balsams, Coreopsis, Larkspurs, Gaillardia, Clarkia, Salvia, Stocks, Poppies.

TALL GROWING.—Cosmos, Helichrysum, Tall Larkspurs, Nicotiana, Salpiglossis, Sunflowers.

THE MARITIME DAIRY SCHOOL

Circumstances, such as epidemic conditions which are still existent in some parts of the country, no special rates granted by railways, the necessarily higher rates for 'board, etc., have somewhat reduced the attendance at the Dairy School this year, but the quality of the students and the interest taken were never higher. The instruction is all being carried on by Maritime men.

Special emphasis is this year being laid on Pasteurization, and experimental work in neutralization. Several labour saving devices have come to the front. Among these perhaps the most noteworthy is a can steaming outfit to remove quickly and thoroughly the cream adhering to the inside of the can. When the statement is made that one creamery estimated its loss through this leak at $2,000, it need hardly be added that the use of the device will be pushed among the creameries.

The great need of the Dairy School is a longer and more thorough course. Inasmuch as the Dairying Associations of the three Maritime Provinces are unanimous in their determination to have a well equipped and thoroughly efficient institution of this kind at pects of this branch of technical education are bright. Following is a list of those in attendance at the Creamery-men's course. The Cheese course begins on Wednesday the 26th inst. The attendance at this course will be more representative of New Brunswick and P. E. Island.

MARITIME DAIRY SCHOOL.

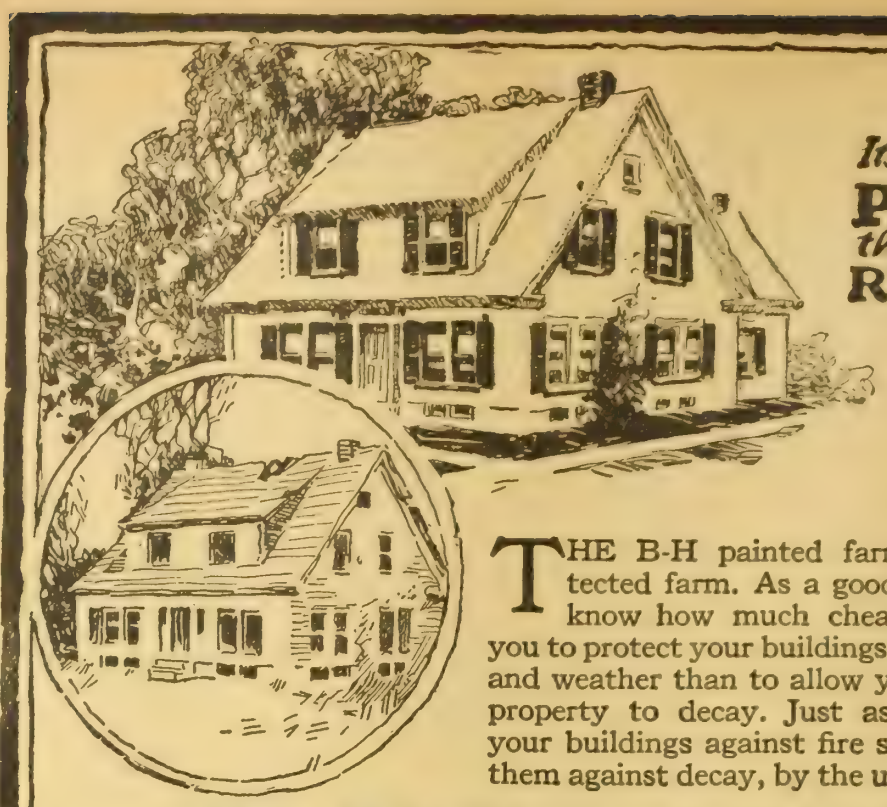
Save all of the manure and apply to your poor land. This is one way, and a most excellent way to have richer land and larger crops.



It's better to **PAINT** *than* **REPAIR**

THE B-H painted farm is a protected farm. As a good farmer you know how much cheaper it is for you to protect your buildings against wind and weather than to allow your valuable property to decay. Just as you insure your buildings against fire so you insure them against decay, by the use of

B-H "ENGLISH" PAINT

70% Pure White Lead (Brandram's Genuine B.B.)
30% Pure White Zinc
100% Pure Paint

This is the paint to use for true economy. While it is slightly higher in price than ordinary paints yet a smaller quantity of this guaranteed paint will cover a much larger surface. This safe dependable paint will last longer than other paints.

The difference lies in the basic formula. No other paint contains anything like the quantity of pure, finely-ground white lead that B-H "English" possesses.

Ask your dealer to show you a can—right on the face of it you'll find the reason for B-H superiority—the guarantee, our hard and fast commitment by which we bind ourselves to the use of the best white lead (Brandram's Genuine B.B.) and pure white zinc in equal proportions.

Insist then upon getting B-H "English" Paint, for it's only by using such high-quality paint as the B-H guarantee ensures that you can be certain of real economy and the utmost satisfaction.

B-H PRODUCTS FOR OTHER PURPOSES

For Interior Finishing "China Lac" the perfect varnish stain.

HOW TO FERTILIZE

Every farmer knows that plants need Food as much as cattle. He knows, too, that plants cannot get all the Food they need out of the ground alone. He must supply them with certain Foods himself, or they will not thrive and bear their full yield of fruit. Exactly as he supplies hay and oats to his horse, he must supply Nitrogen and phosphate to his plants. He may buy these in the open market exactly as he does his hay or his oats, or he can buy them in combination. Moreover, there is no secret value in the "complete fertilizer," it is nothing more nor less than the ingredients combined and sold at a higher price. Nitrogen is by far the most expensive as well as effective of plant foods, and will pay the farmer well to stop and think before he buys it in this combination form or waits season after season for legume nitrogen, or organic nitrogen to become available.

These compounds generally averaging 8-2-2 do not supply what nature requires, for the crops take out more nearly the equivalent of a 2-4-3; that is why we can in most cases and in most soils use Nitrate alone as a straight top dressing, and the earlier the better.

Translated into Commercial Fertilizer terms, the comparison is as follows:

	What Nature Requires	What the Average Brand Supplies
Phosphoric Acid....	2.02	8.00
Nitrogen	4.33	2.00
Potash	3.65	2.00

THE BEST AND CHEAPEST NITROGEN

The cheapest and most practical form in which to furnish Nitrogen to plants is Nitrate of Soda. In the rainless region of Chile are stored away vast quantities of Nitrogen in what are known as Nitrates—the only form in which Nitrogen can be utilized by plants. The Nitrogen which exists in organic, vegetable or animal matter—that is, roots, stems, dead leaves, weeds, leather, tankage, dried blood—and nitrogen as well in the form of Ammonia salts, must first be changed to Nitrate before they can be taken up by plants. This change is dependent upon conditions of weather. If the season be backward, or there be a prolonged drought, this change may be so retarded as to deprive the plant altogether of Nitrate of Food at the very time it needs it most; moreover, certain mineral forms of commercial nitrogen leave acid residues in the soil. Nitrate of Soda, on the other hand, is entirely independent of weather and leaves the soil sweet. It is immediately available under all circumstances, for it is readily soluble, and as soon as it comes within reach of the roots of the plants it is taken up by them. It can, therefore, readily be seen that the practical value of various forms of Nitrogen ranges from nothing at all, where conditions of temperature or soil prevent Nitration, to 100 per cent. as Nitrate of Soda, where Nitrogen has already taken place. Moreover, the process of transforming the Nitrogen of cotton seed meal, dried fish, drier blood, tankage, and other Nitrogenous constituents into Nitrate is very wasteful, for much valuable Nitrogen is lost in the process, as well as by natural oxidation. Official soil experiments have shown that 100 pounds of Nitrogen in these organic forms has only about one-half to three-fourths the manurial value of 100 pounds of Nitrogen in its nitrated form of Nitrate of Soda.

A GREAT SAVING

In view of these facts it seems extraordinary that farmers should continue to purchase their Nitrogen in compounded form in a ready mixed fertilizer, when they can procure it much cheaper, and ready for the plants' immediate use, in the form of Nitrate of Soda.

Nitrogen is often in a form which is not available for food for the plants, for it must first be converted into Nitrate. The time required to do this varies from a few days to a few years, according to the temperature of the soil and the kind and condition of the materials used.

It must be recognized that the grower should have a chance to derive some profit from the use of a fertilizer, and wise buying is a prerequisite to successful use.

HOW IT HELPS CROPS

If a young pig or a young calf does not have an abundance of the right kind of feed when it is young, it becomes stunted in growth, and never recovers fully, no matter how judiciously it is afterwards fed. The intelligent cultivator has learned that this holds good in the feeding of plants. Nitrogen is the element which enters most largely into the building up of the plant itself—roots, stems and leaves. Most plants need to take up the greater part of their Nitrogen during the early stages of their growth, as in oats.

Nitrate of Soda is a plant tonic, and an energizer; it is not a stimulant in any sense of the word.

It may be used alone without other fertilizers, as a Top-Dressing, at the rate of 100 pounds to the acre.

RESULTS WITH NITRATE

For four years in succession samples of Nitrate of Soda were sent to farmers. In each experiment two patches were marked out side by side. One received an application of Nitrate of Soda at the rate of 100 pounds per acre, the other had none. The following are fair samples of the results reported:

CROP—SUGAR BEETS

Name, Louis Lorquet.
P. O. Address, Farnham,
R. F. D.
State, Quebec.

Plot without Nitrate produced 480 lbs.

Plot with Nitrate produced 780 lbs.

Date of applying Nitrate of Soda, June 25.

Date of completing harvesting of the crop, October 20.

Remarks: "I am very satisfied with the effect of your Nitrate Soda. 300 lbs. with surplus, certain 4 furrows of 100 feet.

CROP—GRASS

Name, M. H. O'Brien.
P. O. Address, Upper Middleboro.
R. F. D.
State, Cumberland Co., N. S.

Plot without Nitrate produced 120 lbs.

Plot with Nitrate produced 210 lbs.

Date of applying the Nitrate of Soda, May 15.

Date of completing harvesting of the crop, July 28.

Remarks: Could see where the Nitrate was put on one yard away. The hay grew thicker and the quantity much heavier. Much pleased with Nitrate.

CROP—BARLEY

Name, F. M. Travis,
P. O. Address, Marlboro,
R. F. D. No. 1,
State, New Hampshire.

Plot without Nitrate produced 1 1 3 bushels.

Plot with Nitrate produced 2¼ bushels.

Date of applying the Nitrate of Soda, May 18.

Date of completing harvesting of the crop, August 5.

Remarks: The Barley where Nitrate was used was 8 inches taller than the Barley where no Nitrate was applied. I am well pleased with the results obtained.

CROP—OATS

Name, J. M. Winder,
P. O. Address, Williamsport,
R. F. D.,
State, Pennsylvania.

Plot without Nitrate produced at rate of 17 bushels per acre.

Plot with Nitrate produced at rate of 35 bushels per acre.

Remarks: The plot with Nitrate could be very plainly seen while growing.

CROP—WHEAT

Name, rFank I. Stevenson,
P. O. Address, Perry,
R. F. D., 1,
State, Ohio

Plot without Nitrate produced 75 pounds.

Plot with Nitrate produced 138 pounds.

Date of applying the Nitrate of Soda, April.

Date of completing harvesting of the crop, August.

Remarks: Crop was on gravel land, rather dry for it most of the Summer.

CROP—POTATOES

Name, T. J. Rhodes,
P. O. Address, Leitchfield,
State, Kentucky.

Plot without Nitrate produced 5 2 3 bushels.

Plot with Nitrate produced 11 1 3 bushels.

Date of applying the Nitrate of Soda, May 14.

Date of completing harvesting of the crop, October 13.

THE RATIONAL AND IRRATIONAL USE OF NITRATE OF SODA

Everywhere in the world where there is progressive experiment station work, the unique qualities of Nitrate of Soda are putting it ahead of every other Nitrogenous plant food. Nobody who advocates the rational use of fertilizers ever recommends such large quantities of Nitrate of Soda per acre as would result in any abnormal accumulation of alkali salts. Moreover, the use of acid phosphates, associated as they are frequently with sulphate of lime, converts any alkali residue into harmless forms of soda.

The use of potash salts tends to leave acid residuals in the soil, as do acid phosphates even when rational quantities of acid phosphate and potash salts are used. Nitrate of Soda is needed to help neutralize these residues.

In most of our experiments where Nitrate was used alone at the rate of only 100 pounds per acre, with no further application of fertilizers to the plots, a decidedly marked effect was noticed. This speaks very well indeed for Nitrate of Soda not leaching out of the soil. The readily soluble elements of fertility are the readily available elements. The natural capillarity of soils, doubtless, is in most instances a powerful factor in retaining all the readily soluble elements of fertility, otherwise all the fertility of the world would, in a season of two, leach away into the ocean; and be permanently lost. A case is yet to be seen where the after effects of Nitrate is not distinguishable, and in most cases such effects have been marked. The 2,000 or more tons of active service soil in an acre of land has a powerful holding capacity for all the useful, available elements of fertility.

HOW TO USE NITRATE

Recent experiments suggests that Nitrate may be applied as a Top Dressing to best advantage as soon as growth starts in the Spring, or even better, before seeding or planting.

Nitrate of Soda should be thoroughly cultivated in, as should other fertilizers, so that they may properly nourish the plant roots of the seeded and cultivated crops during the growing season. Most fertilizers should not touch the seed.

Nitrate has no acid residue to leave behind and it will leave nothing deleterious in your soil after using. It will enable you to overcome the effects of droughts and frosts in the shortest possible time and prolong the bearing period of your trees. Nitrate does not have to wait to get busy.

PROOF POSITIVE

In a twenty year test to determine the value of various sources of Nitrogen, the New Jersey Experiment Station found "that crop yields and the percentage of Nitrogen recovered in the crop was greater when Nitrates were used."

Official figures are—

"If we assign to Nitrate Nitrogen a value of 100, then the relative availability of the four materials stands as follows.

Nitrate of Soda.....	100.0
Ammonium Sulfate.....	76.1
Dried Blood.....	62.0
Manure	52.4

This research was published in "Soil Science," April, 1918.

VALUABLE BOOKS FREE

Numerous books have been written on the value of Nitrate of Soda in agriculture. These books deal with questions on which progressive farmers cannot afford to form incorrect opinions:

If you are farming to make money you owe it to yourself to send for the free books which pertain to your crop. If you want to know what farmers have done both in America and Europe, who grow the same crops as you do, these books will tell you. If you have any doubts on how valuable Nitrate of Soda would be to your particular crop, you should get all the available information you possibly can on the subject.

These booklets are free—write for them, addressing

Dr. Wm. S. Myers,
CHILEAN NITRATE COMMITTEE,
25 Madison Avenue, New York, U. S. A.

Why Europe Makes Bigger Crops Than America

Average Production of European Crops is as follows:

Wheat.....33 bushels per acre
Oats.....45 " "
Potatoes.....199.84 " "
Cotton in Egypt.400 pounds "

Europe uses a Home-Mixed Nitrate Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrate Nitrogen.

Average Production of American Crops is as follows:

Wheat.....14 bushels per acre
Oats.....40 " "
Potatoes.....97.15 " "
Cotton.....185 pounds "

America uses a Fertilizer containing 8 per cent of Phosphoric Acid and 2 per cent of Nitrogen which is mostly not readily available.

The difference in yields is largely due to larger amount of Nitrate Nitrogen used in Europe per acre as Nitrate of Soda. Our small American acre yields are due to failure to appreciate this necessity.

Write for "Chilean Nitrate Has Done in the Farmer's Own Hands."

DR. WM. S. MYERS,

Chilean Nitrate Committee 25 Madison Avenue, New York, U. S. A.

A GREAT CROP PRODUCER

It is plain, therefore, that the cultivator cannot afford to overlook Nitrate, and thus endanger the chances of his crops, which must have Nitrogen in a form the growing plants can use. The presence of Nitrate at the outset enables the plant to get its food when it needs it most, and develops a vigorous growth of roots, leaves and stems capable of withstanding the scorching rays of the sun or sudden changes of temperature, disease, or the attacks of parasites. It is then able to mature properly. Without Nitrate present the young plant will fail to attain stem and leaf growth sufficient to mature its fruit or grain. Why take chances with makeshifts or substitutes when the real thing is 100 per cent effective?

Nitrate of Soda is of high value for early crops, such as peas, corn, beets, cabbage, where rapid maturity is desirable. It is a special help to hay, grain, rye, wheat, timothy, cereals and orchards, all of which are unable to obtain sufficient Nitrogen from the soil just when they need it. It is a great specific in the production of sugar beets, potatoes, cotton, cane and apples, or other fruits.

Small fruits, such as blackberries, currants, raspberries and gooseberries, which need a steady, even growth, are greatly benefited by Nitrate of Soda, which can be furnished all ready for digestion when the plants require it.

The highest agricultural authorities have established by careful experimentation that 100 pounds per acre of Nitrate of Soda applied to crops has produced the increased yields tabulated as follows:

Apples	100	bushels
Barley	400	pounds
Corn	280	pounds
Oats	400	pounds
Rye	300	pounds
Wheat	300	pounds
Potatoes	3,600	lbs. Tubers
Hay, upwards of	1,000	lbs. Barn cured
Cotton	500	lbs. Seed cotton
Sugar Beets	4,000	lbs. Tubers
Beets	4,900	lbs. Tubers
Sweet Potatoes	3,900	lbs. Tubers
Cabbage	6,100	pounds
Carrots	7,800	pounds
Turnips	37	per cent
Strawberries	200	quarts
Onions	1,800	pounds
Asparagus	100	bunches
Tomatoes	100	baskets
Celery	30	per cent
Hops	100	pounds

WINTER EGG RECORDS FROM MEMBERS OF THE BOYS' AND GIRLS' CLUBS OF NEW BRUNSWICK

Many excelent reports are being received by the Poultry Division of the Department of Agriculture from members of their Boys' and Girls' Poultry Clubs organized in the spring of 1918. These clubs were formed in almost every county and are composed of boys and girls varying in age from 12 to 18 years. A few members are only 10 and 11 years of age and many of these are the most successful. Each member was provided with fifty eggs for hatching from heavy laying strains of Barred Plymouth Rocks which have been bred for heavy egg production for several years.

The following are some of the reports which have come to hand within the last week:

P. Stanley Tripp, R. R. No. 3, Burtts Corner, York Co, 17 pullets.—January 259 eggs, or 15.2 per bird, or 49.1% production; February 248 eggs, or 14.6 per bird, or 52.1% production. These pullets began laying December 27th so that only a small number were laying by January 1st, and yet the January record is exceptionally good.

Alice L. Lever, R. R. No. 1 Rollingdam, Charlotte County, 17 pullets.—December, 37 eggs, or 2.1 per bird, or 7% production; January, 107 eggs, or 6.2 per bird, or 20.3% production; February, 233 eggs, or 13.7 per bird, or 48.9% production. This members chicks were not hatched until May 30th. Earlier hatching would no doubt have greatly increased early wniter production.

Hazen I. Reed, R. R. No. 1, Rollingdam, Charlotte Co., 3 pullets.—January, 151 eggs, or 18.8 per bird, or 60.8% production; February, 87 eggs, or 10.8 per bird, or 38.8% production. This boy's pullets were hatched May 10th and began laying Sept. 20th, at 4 months and ten days, but the record previous to January 1st is not available. Two pullets went broody in February, which partially acounts for the decline in production. This boy has a pen of pullets in 5th place in the P. E. Island egg-laying competition.

Gilbert Emmerson, R. R. No. 1, Rollingdam, Charlotte Co., 15 pullets.—December, 108 eggs, or 7.2 per bird, or 23.2% production; January, 215 eggs, or 14.3 per bird, or 46.2% production; February, 200 eggs, or 13.3 per bird, or 47.6% production. Up to March 1st this member paid for eggs he received the previous spring, paid for the feed of both growing stock and laying bird,s accumulated a bank account of $36.00 and had 15 pullets and 1 cockerel worth $2.00 each as stock on hand, or a net profit of $68.00.

Harry Patterson, Hoyt Station, Sunbury Co., 19 pullets.—December, 85 eggs, or 5 per bird, or 14.4% production; January, 319 eggs, or 16.5 per bird, or 54.1% production; February, 389 eggs, or 20.5 per bird or 73.1% production. This boy has made an enviable record in his poultry enterprise and is one of the younger members. Such an egg production no doubt is an exceedingly profitable one.

Jessie and Harry O'Leary, Beaver, York Co., 14 pullets.—No monthly record was kept o fthese birds but to March 8th they had laid 72 dozen eggs (864) or an average of 61.7 eggs per bird. This is a remarkable record.

The foregoing records are from flocks of pullets where absolutely no culling was done. In the first four cases the number of pullets stated is the product hatched and raised from fifty eggs set by the poultry club member. In the latter two cases the number os the product of one hundred eggs. In two cases a few good pullets were taken from the flocks in payment for eggs supplied, making the number shown lower than is actually the case.

The figures given may be taken as unmistakable evidence that there is money in poultry in spite of war time conditions whch largely prevailed during the time these results were obtained. If the fourth member cited, (Gilbert Emerson) would sell his pullets and cockerel at $2.00 each (he has har this offer) his net profit of $68.00 is at the rate of $4.50 per pullet now in his breeding pen. Figuring on another oasis, he paid the equivalent of ten cents per egg for his hatching eggs and to March 1st has made each of those fifty eggs bring him $1.36 net profit. This boy i sabout twelve or thirteen years of age and has done al of the work in connection with his poultry.

In the last case (Jessie and Harry O'Leary) the egg production of the birds has been distributed uniformly throughout the winter. Estimating the eggs at a conservative market value of 60c per dozen or 5c per egg, these members pullets have returned them over $3.00 per bird practically to March 1st, or as what is commonly considered winter egg production.

It is commonly thought that birds which do not lay in winter will make up for lost time in the summer. Expermental data , however. does not confirm this belief. If it were true. it would be difficult to conceive of a pen of birds overtaking a lead of 61.7 eggs during the spring and summer months. Ordinarily these high winter producers can be relied upon for good spring and summer laying. Even if the winter non-producers did equal. in the course of the year the production of the winter layers they would still be considerably in arrears as to net value of eggs laid. Sixty eggs in wnter at 60c per dozen are equal to 90 eggs in summer at 40c per dozen or 120 eggs at 30c per dozen.

The secret of winter egg production lies largely within the stock, but it is up to the poultryman to reveal the secret. High winer egg producton is an artificially created faculty, i. e., it has been made possible by scientific breedng to prefix to the normal spring egg production, (when everything wearing feathers lays) a winter cycle of production. Some strains of poultry have this faculty much more highly developed than others. Many are almost or entirely devoid of ti. Furthermore it is not developed without effort and does not long continue to exist without further effort.

The male bird is a potent factor in the transmission of high winter egg production. His ability in this regard are inherited from both sire and dam whereas a pullet's power to lay heavily in winter comes mostly from her sire. To apply this fact to the practical economics of the poultry business we may suppose the birds owned by one of the club members mentioned (Jessie and Harry O'Leary for example) are sired by a certain male. The production of these birds to date may be conservatively estimated at 60c per dozen or $43.20 for the entire winter production. Such a male is therefore wirth $43.20 more than another which

The Big Leak Is In The Roof

Leaky roofs cost a lot of money. Each year time and dollars are spent to repair the damage done by frost, snow, ice, rain, sun and wind.

Figure the amounts paid for repairing materials alone and you will find it runs into big figures.

Save yourself future roofing troubles and expenses by putting on a real roof, now.

PAROID
A
NEPONSET ROOF

pays—because it lasts and protects.

Every building on the farm should be roofed with Neponset Paroid Roofing, from the big barn to the smallest cribs. It defies snow, rain, sleet or sun. It is fire-resisting and proves its economy by giving perfect satisfaction and years of wear.

Roof with Neponset Paroid and save money.

Neponset Paroid Roofing is made in three colors, red, green, and slate grey.

Sold by Hardware and Lumber Dealers.

BIRD & SON, LIMITED HAMILTON, ONT.

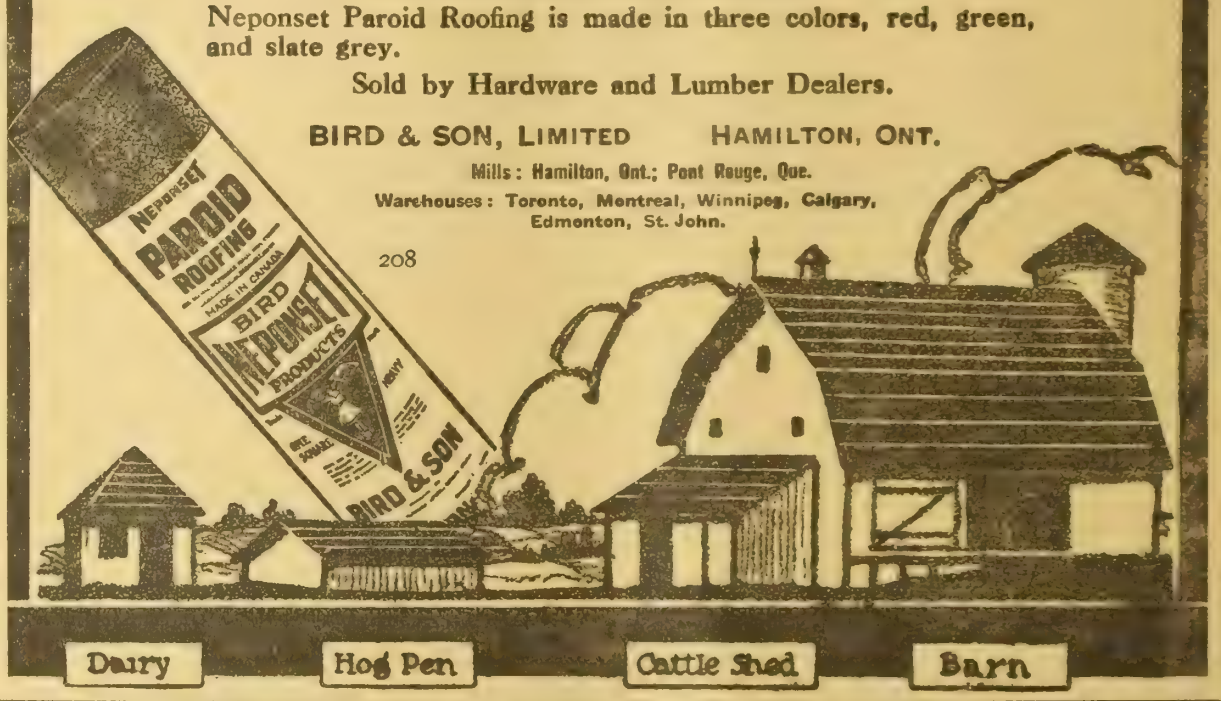
Warehouses: Toronto, Montreal, Winnipeg, Calgary, Edmonton, St. John.

208



could not produce pullets capable of laying before March 1st. Yet it is a fact that cery few of our farmers or poultry raisers will pay the modest sum of $2.00 for a cockerel or a setting of eggs from such a strain if they can obtain one elsewhere with no breeding at all for $1.50 or less.

One of the environmental factors essential to winter egg production is **early hatching.** The general purpose varieties e. g. Plymouth Rocks, Wyandottes and Rhode Island Reds should be hatched in the latter patr of March or in April. Sometimes early May is satisfactory, but it is not dependable. Late hatched birds are sometimes forced to early laying, but they can seldom be depended upon to give a steady yeild and they are of doubtful value as breeders.

WINTER EGG PRODUCTION

(Experimental Farms Note.)

The possibilities for making a good profit from winter eggs were never better than they are at the present time; altrough many poultrymn and farmers have reduced their poultry activities during the last year, thinking that at the present high price of feeds profits from eggs would be impossible. However, the profit or loss from the poultry does not depend upon feed alone. The successful poultryman must pay the strictest attention to all the essentials of care, feeding and management. if he is to make his work proztable. Even the slightest negligence on the part of the poutryman in any of these essentials may mean the loss of many eggs. A high producing hen is very like a delicate machine, easily put out of repair. Anything that interferes with the health of the flock for even a day may cause a high producing flock to become non-producers for a period of from two to three weeks or longer. Remember a hen lays an egg, or doesn't, never a half. All hens or pullets should be efficient transformers of raw materials into a finished product. This transformation, to be the most profitable ,should ,take place when the price of the finished product (eggs) is at its maximum, which is during the winter months. All hens or pullets tend to consume a similar amount of food, regardless of whether they are good or poor winter layers. It is during the winter months of Nevembr, Dcember, January, February and March, when the poultryman has to supply his flock with all of the following: grain, mash, vegetable and animal food, grit, shell and charcoal, that his expenses are the heaviest; therefore if, by careful and judicious feeding and management, he can have his flock producing eggs enough to defray expenses, or to give him a small profit, he is bound to be more successful than the poultryman who has to pay the winter's board of his flock from his spring egg production.

During the months of November, December and January the egg production at the Experimental Station, Charlottetown, from a pen of 50 White Leghorn pullets was November 159, December 623, January 762, making a total of 1544 eggs.

From these records it will be seen that the White Leghorn pullets averaged 3.18, 12.46 and 15.24 eggs for the months of November, December and January respectively.

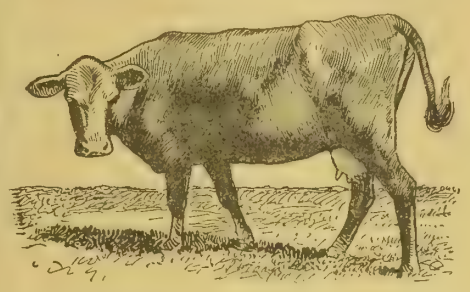
The cost of feed consumed was—656 lbs. whole grain $21.84, 328 lbs. mash $9.47, 38 lbs, shell 70c., 15 lbs. grit 27c., 22½lbs. beef scrap $1.35, and 500 lbs. mangels $2.00, making a total cost for feed of $36.13.

The value of the 128 1/3 doz. eggs at 55c was $70.77; deducting the cost of feed, $36.13, left a profit over cost of feed for the 50 pullets for three months of $34.64.

It will be seen from the statement above that these pullets not only paid for their feed during the time specified, but yielded a net profit of 69c per bird.

"Scrub" Feeding is as Bad as "Scrub" Breeding

A poorly fed cow that gives less than, or only enough, milk to pay for her keep requires just as much attention, just as much feed for upkeep and must be milked just as often as a good cow. Scrub feeding does not pay.



By feeding your cows a ration containing the proper amount of proteins, with a proper balance between constipating and laxative ingredients, together with sufficient bulk for proper digestion, you are bound to get larger yields of milk.

Your feed problem is solved quickly and satisfactorily by using

Monarch Dairy Feed

It is mixed in the proper ratio to produce the largest yields of milk. It keeps the cows in good healthy condition. Monarch Dairy Feed is highly digestible and is composed of oil cake meal, cotton seed meal, bran, corn feed and barley feed—an ideal ration for high milk production.

Monarch Dairy Feed, while being very rich, may be safely fed alone. The guaranteed analysis is: Protein 20%, Fat 4%.

Give Monarch Dairy Feed a trial. It solves one of the important points in successful dairying. Give your dealer's name and we will send you booklet, "Getting the Most Out of Dairying."

Monarch Hog Feed

A special Feed that meets all the requirements of the brood sow and the growing pig; consists principally of corn meal feed, shorts and digester tankage. Guaranteed analysis: Protein 15 per cent., Fat 4 per cent.

Sampson Feed

Meets the demand for a general purpose feed both for cattle and hogs. It is sold at a somewhat lower price than either Monarch Dairy Feed or Monarch Hog Feed. Guaranteed analysis: Protein 10 per cent., Fat 4 per cent.

SHORT CLIPS FROM THE SHORT COURSE

And now the poor farmer must learn Chemistry; not the elaborate laboratory science, but enough to make him an intelligent judge of the relative value of different fertilizers. The lecturer make it very clear that many farmers delude themselves with cheap fertilizers. The standard acid phosphate, for example, contains about 16% of phosphoric acid, the only element in the mixture that is of value as a fertilizer. The 14½ material comes at a lower figure per bag, but the purchaser of this latter simply buys a larger percentage of such sand as he might get for nothing on his own farm. He makes a bad bargain inasmuch as he pays bagging and freight charges on material that is of absolutely no value as a fertilizer. Ask for the high grade stuff. The tag on the bag gives its content of useful matter.

The motor tractor has come to stay. This season Nova Scoia will have a good look at it from the practical standpoint. There will be about a hundred of these machines scattered over the Province. Four different makes were on exhibition at The Short Course, Truro; the Cleveland Caterpillar type, the International Harvester 8-16, The Case 9-18 and the Fordson. Two years ago there was not one in the Province.

Plant a strawberry patch. The market was greatly undersupplied last eyar. The Annapolis Valley shipped les sthan one third the number of crates shipped two years before. This is a crop that sandwiches in well. Half grown children can manage nearly all the labour, and strawberries do particularly well in Nova Scotia. In these days when the cash income is such a vital matter, quite a substantial addition to it may be picked off the strawberry patch.

With a splendid protective law, with the best breeds available through the efforts of the Provincial Dept. of Agriculture, and with prices for wool and mutton products extremely high and likely to remain high, it is not remarkable that the sheep population of Nova Scotia has increased from 205,500 in 1915 to an estimated total of 259,800 in 1919. The Canadian Cooperative Wool Growers Association, which handled more than half the entire clip of Canada last year, buying in every Province of the Dominion, report that the highest prices were netted by the product of the three Maritime Provinces. There is ample room for big expansion in this profitable branch of agriculture.

PROFITS OF OTHERS

"I can't see why a farmer to-day can't make money," said a well-to-do grocer recently.

"No," replied a friend, in a friendly way, "and the farmers can't understand how you are making $20,000 a year in that store of yours—when you're not!"

The point he made was that there is a lack of understanding between urban and rural people; an antagonism exists which prevents it.

Overcome this antagonism and a great step in the direction of national unity will be achieved.

And the antagonism can only be removed by an intelligent study of the condition of both, by a frank recognition of each other's difficulties, and a DESIRE for unity and harmony.

N. B. DEPT. OF AGRICULTURE RULES GOVERNING STANDING FIELD CROPS COMPETITIONS SEASON OF 1919

Standing Field Crops Competitions will be held in the various counties of New Brunswick during the season of 1919 on the following basis:

There will be four competitions in each county, viz., Wheat 1 acre; Oats 2 acres; Turnips 1 acre; Potatoes 1 acre.

The variety must be named when making entry.

An entry fee of twenty-five cents will be charged for one crop and twenty-five cents for each additional crop entered by any one farm.

Entries wil lnot be received for more than one variety of wheat, oats, turnips or potatoes from one farm.

Entries accompanied by the stipulated entry fees must be lodged with the Secretary of each Agricultural Society on or before July 15th.

The Secretary of each Agircultural Society will forward all entries and fifty per cent. of fees thus received to M. A. MacLeod, Supt. of Agricultural Societies, Dept. of Agriculture, Fredericton, on or before July 20th.

Entries not lodged with the Department of Agriculture before July 25th and entries not accompanied by the specified entry fees will not be judged.

The minimum number of contestants necessary to constitute a competition in any one crop in a county will be five.

A prize will not be awarded on any crop that does not score 80 points out of a possible 100 points.

The number of prizes in each competition will be based on the number of competitors and the score they make as follows:

5 entries	$20.00
6 to 10 entries	40.00
11 to15 entries	60.00
Over 15 entries	75.00

The sum of five dolairs will be deducted from each of the foregoing amounts and the balance will be divided pro rata among the contestants scoring 80 points or over.

To the highest awards will be added an additional sum of three dollars and two dollars respectively (these amounts constitute the five dollars deducted as above mentioned) as a special inducement to aim for first place.

First and second prize winners will be required to exhibit their grain at the Provincial Seed Fair, Fredeicton, before the above mentioned additional amounts are paid.

The judging will be done by representatives of the Department of Agriculture. The Federal Seed Division will not grant prizes after this year on field crops competitions excepting in cases where the growers use registered seed. Get a small quantity of registered seed this year so that you will be in line to participate in the 1920 competitions.

Prize winners in the Standing Filed Crops Competition will find it to their advantage to select, clean and grade their surplus food grain and offer it for sale for seed purposes and buy their feed oats if necessary. The growing of good grain is a profitable side line for the progressive New Brunswick farmer.

A special competition in clover growing is being planned, full particulars of which will be announced in good season.

M. A. MacLEOD,
Supt. of Agricultural Societies.

GET MACHINERY READY NOW

Winter is almost over and the rush of spring work will soon be here. To many of the farmers the thought of approaching spring acts somewhat like a sudden jolt, while to others it cannot soce too quickly. Why the difference ? As a general rule most people are glad to see the approach of spring and budding life, but on the other hand thre are farmers who have so many odd jobs to do before they are ready to start the spring cultivation that they are behind all the time This shows a lack of considerate management, which in most cases could be easily overcome.

The chief trouble lies in not being prepared for the spring rush when it comes. The marhinery is in need of repairs, the seed grain has not been fanned, harness not ready and in some cases colts that are expected to do a share of the work have not been trained. All these things piling up at once are enough to wreck the year's efforts, which a little planning ahead could have averted.

Winter is the farmer's spare time, and during that slack period he should aim to get all the little preparatory jobs done that are possible, and thus save valuable time during the busy season later on.

Now is the time to go over the machinery and see that it is in proper repair and ready to go out to the fields on short notice. It is true most farmers have their implements stored in a shed, more or les closely packed and it is no little chore to take these out and overhaul them. However, most men can remember, if they try to, whether any part of their implements were broken last year, and have not been replaced. If not the extra parts should be ordered now before the implements are required. If they cannot be put on without taking the machinery out of the shed they should be ready, and a day before seeding begins can generally be spared, and the work done without too much loss of time. If any whiffltrees or eveners have been broken they should be repaired now, and an extra few made for emergency. The harrow teeth sould be sharpened if necessary, and the disc and disc drill should receive attention. Oil the harness, replace worn out pieecs and mend breaks that may have occurred. In short, put everything possible in shape before the season's work starts, and it will help out greatly when spring activities commence. The present is not a very busy time and no better use can be made of idle days than to go over the machinery and equipment needed for the spring and summer work, to put everything in good working shape. It may save serious delay later on.

FINE MEETING AT DARTMOUTH

A fine meeting was held at Woodlawn Schoolhouse, Dartmouth, on Wednesday evening, the 26th inst., when Mr. J. D. McKenna, of the Maritime Farmer, spoke on co-operatiin. The President of the Dartmouth Agricultural Society, Mr. Maynard Tullock, was in the chair. The attendance was good and those present decided to get down to business. They will have another meeting on April 2nd, when arrangements will be made to carry on business as a society next season. The Dartmouth society will probably buy its fertilizers, feeds, seed, etc. co-operatively.

If I will take care of my character, my reputation will take care if itself.

A GARDEN FULL OF VEGETABLES FOR $1

In preparing the following Home Collection of Vegetable Seeds, which, if purchased separately from our catalogue, would cost $1.50, we have given critical attention to the varieties offered, selecting only those which have been tried and proven of excellent merit under widely different conditions of soil and climate.

One packet each of the following for $1.00

Beans—Sutton's Masterpiece
Beans—Ferguson's Golden Wax
Beets—Ferguson's Imp. Dark
Carrot—Ferguson's Early Market Red
Corn—Golden Bantam
Cucumber—Davis' Perfect
Lettuce—Ferguson's Peerless
Lettuce—May King
Onion—Ferguson's Red Wetherfield
Parsley—Ferguson's Perfection
Peas—Gradus
Radish—Long White Icicle
Radish—Ne-Plus-Ultra
Swiss Chard—Giant Luculus
Turnips—Early Stone

ORDER YOUR COLLECTION NOW

Mail this advertisement with Check, Money order, Dollar Bill, or Stamps, or present at our store, and secure this excellent collection of Vegetable Seeds for only $1.00 sent prepaid anywhere in Canada.

Our Spring Catalogue sent on request.

THE AGRICOLA CENTENNIAL

The world owes a great deal to men of vision—men who recognized possibilities, and who formulated ways and means whereby the latent possibilities might be brought to light and put into successful operation. Men such as these have set ideals towards which many of their fellow men have set their faces in the onward movement of their respective professions to a higher plane. Might movements frequently eminate from small beginnings. Such a movement we find in the development of agriculture in Nova Scotia. One hundred years ago agriculture was a despised and neglected art in that province. Men were in the habit of apologizing for being farmers and their methods were frequently crude. People from the Old Country believed that her climate rendered farming in Nova Scotia little better than a joke, while the Americans made merry over the efforts of the Provincialist farmers and sold them most of their food.

How a man of vision changed all this in a few years by proving conclusively that Nova Scotia's climate and soil were fitted for the development of practical farming and putting confidence into the hearts and knowledge into the minds of men of the land is clearly set forth in the following extracts from a letter to the Maritime Farmer by Prof. Cumming, Secretary for Agriculture and Principal of the Nova Scotia Agricultural College, a gentleman who has been in the formemost ranks of those who have given and are giving our agriculturists a broader vision of the possibilities of their calling:

"On July 15, 1918, the first of a series of 38 letters on Agriculture signed by Agricola, appeared in the Acadian Recorder, a newspaper still published in the city of Halifax. The occasion of the publication of these letters was a marked depression in Colonial business following the conclusion of the Napoleonic wars, during which the Atlantic Provinces in particular had been extremely prosperous on account of the profitableness of building ships and prosecuting various lines of trade in connection with the war. The depression had become so marked that real estate values had diminished and the country was facing still greater depression.

"Agricola, who nine months afterward revealed himself as John Long, a gentelman who migrated frrom Glasgow, Scotland, in 1814, who prosecuted business in Halifax and who subsequently bought and operated a farm at Willow Park, near the Exhibition Grounds at Halifax, argued in the course of his letters that the only hope for the prosperity of the country ws the development of its agriculture. The letters aroused the most enthusiastic response and were responsible for the rejuvenation of the art of agriculture in Nova Scotia. Within less than a year of the publication of the first letter, 25 Agricultural Societies and a Provincial Secretary at Halifax were organized, a system which has remained in existence ever since that time.

"Agricola himself was appointed Secretary of the Provincial Agricultural Society and subsequently as Member of the Legislature of Nova Scotia for the then County of Sydney (now Antigonish) pioneered the present Department of Agriculture.

"On the centennial of the appearance of these letters of Agricola, the Acadian Recorder has begun the republication of these letters.

Last year a great interest was taken in the erection of a memorial to Herbert, the great agriculturist of Quebec. It would seeem fitting that some similar recognition should be given Agricola, the great pioneer of agricultural development in Nova Scotia.

"Already it is planned to erect a fitting memorial to him in Nova Scotia and in the meantime marked interest is taken in the appearance of the letters.

"I am sure a reference to this in the columns of your paper would be very much appreciated by readers in Nova Scotia."

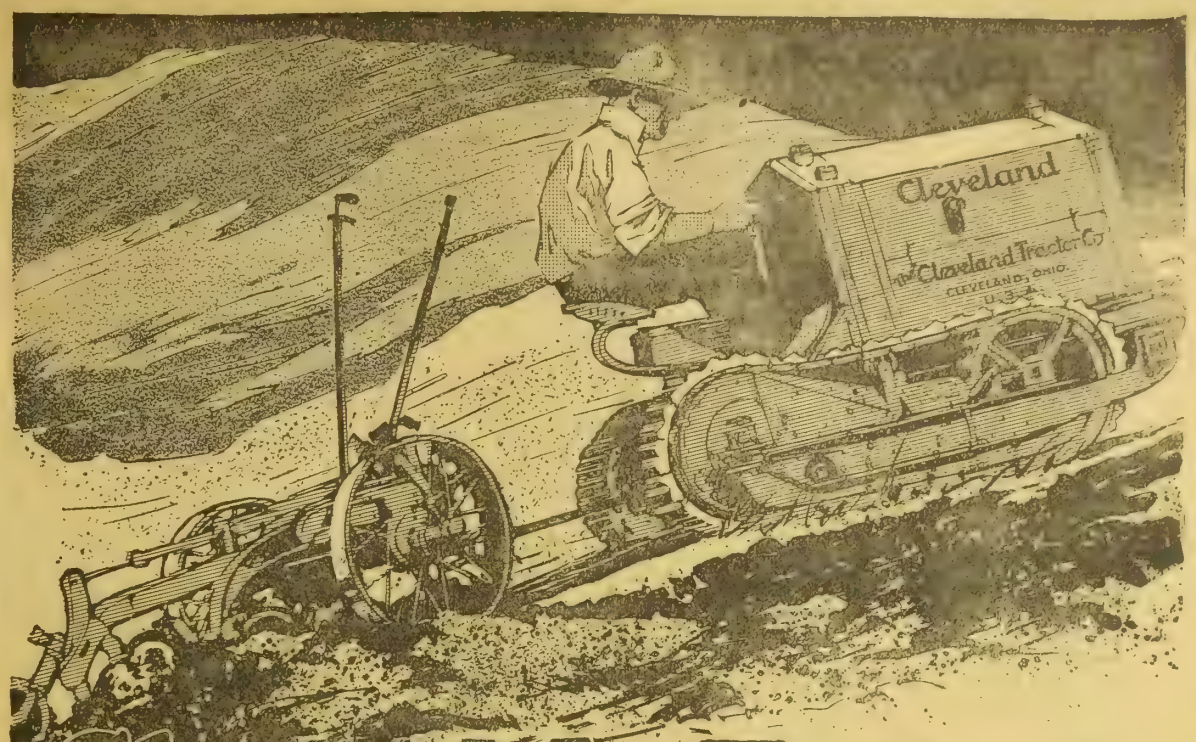
The thirty-eight letters were devoted to the following subjects:

1.—The low state of Agriculture and trade in the Province.

2.—Agricultural Societies.

3.—Benefits elsewhere of such So-

(Continued on page 787)



Show Me Facts !

BEFORE you buy *any* tractor you have every right to say to the manufacturer : "Show me what the USERS of your tractor have to say. *Show me* that it has already proved itself economical and practical in everyday work. *Show me* the *figures* your *users* have given you so that I may figure costs and so determine why I should own one of your tractors."

Here, then, is part of one of the large number of letters constantly received from farmers telling us what their *Cleveland Tractors* do for them.

To begin with, I used my Cleveland Tractor to plow about 305 acres during 1918 and used double discs, two 60 tooth harrows and a heavy wooden drag on one load for fitting.

When I plowed I covered from eight to ten acres a day with a two-button gang and covered about 40 acres a day with the harrows.

I harvested 150 acres of wheat and oats at 25 acres per day.

In July I used the Cleveland in loading hay, and got in the crop from 140 acres at the rate of about 35 tons a day.

Besides these things, I used my Cleveland for a great many belt jobs—put in 300 tons of ensilage in 32 hours, on 30 gallons of kerosene, for instance.

I now keep six horses instead of the fourteen I had before and need two men less than previously.

My Cleveland is in excellent condition, ready for the 1919 season, and counting everything, I haven't spent over $10 for repairs.

F. H. JOHNSON,
New Augusta, Indiana.

Such specific, definite facts tell why the Cleveland is so fully justifying the faith that so many farmers have placed in this compact, powerful Tractor. *Write today* for complete information and the name of your nearest Cleveland dealer.

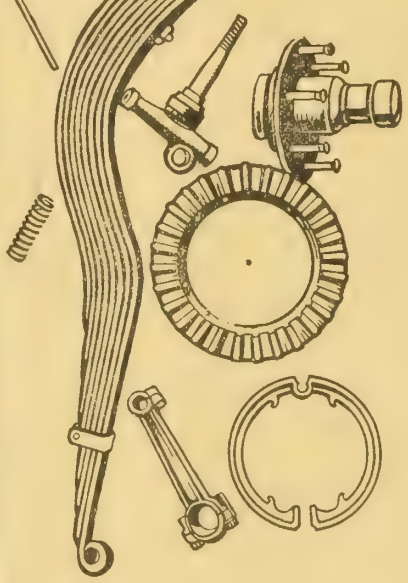
Now *Staple* Articles of Trade



THE parts of a Ford car—*every* part—can be bought *anywhere* in Canada.

They need not be "ordered from the factory."

—nor from a Ford Branch.

—nor even from one of the 750 Ford dealers.

They can be delivered "on the spot" by over 2000 garage and repair men.

Although highly specialized pieces of engineering and machining, Ford parts have become *staple articles of merchandise*. They are as easy to obtain as a hatchet or a saw.

This is a most unusual service to the owner of a car.

Its value is incalculable.

The Ford car need never be "tied up" while repair parts are being "brought on from the factory."

There need be no annoying delays while touring because Ford Service Stations are located everywhere.

The owner of a Ford (barring serious breakdown through accident) may enjoy uninterrupted use of his car.

Caution to Ford Owners

Never allow "spurious" or imitation parts to be used in repairing your Ford. Your repair man—if he is earnest in his desire to serve you well—can get genuine Ford parts and sell them to you at a reasonable profit.

You need never accept "spurious" repair parts. In any locality, in any emergency, there is sure to be close at hand, a Ford Service Station.

Demand genuine Ford parts. Be firm.

Keep your Ford running at full Ford efficiency.

FORD MOTOR COMPANY OF CANADA, LIMITED, FORD, ONT.

DEMAND Genuine Ford Parts

CO-OPERATIVE DAIRYMAN

REGISTERED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 24. SUSSEX, NEW BRUNSWICK, APRIL 22, 1919. Number 14.

N. B. Fruit Growers Annual Convention

The fourteenth annual meeting of the New Brunswick Fruit Growers' Association was held in the Council Chamber of the Fredericton City Hall on April 2nd. A representative number of members were present.

The President's Address

When the convention opened the President, Mr. S. B. Hatheway, of Springhill, York County, read the following address:

"Your executive has considered it in the best interest of the Association to hold the annual meeting apart from any other organization. We have felt that our members are sufficiently interested to attend a busines meeting where fruit growing alone is discussed without having to offer other inducements to come to Fredericton.

"As you have observed, the programme we have prepared has to do with all phases of fruit growing and althought the total fruit output of the Province is not large yet we must consider our possibilities for greater production rather than present conditions.

"The strawberry crop in 1918 throughout the province, was one-half to two-thirds of an average. Prices generally were high and yet thousands of boxes from up-river points sold in St. John for comparatively low prices. While these growers have learned to expect such prices there is absolutely no reason why they should.

"During the discussion on berry growing it wil lbe shown that by organization with proper methods of handling and packing, New Brunswick strawberries can be sold at prices that will make it a very attractive business.

"Other soft fruits have not been allotted any special place in the programme yet it is to be hoped that some of the members will discuss their growing and marketing. Undoubtedly we have a splendid opportunity to develop the raspberry and gooseberry shipments to the equal of the strawberry business.

Good Prices for Apples

"Apples, the past year, while a short crop, returned exceptionally high prices. No. 1 McIntosh sold as high as $8.00 per barrel and $3.50 per box, while the fall varieties shipped through the Association returned prices ranging from $4.16-$4.60 for No. 1; $3.73-$4.16 for No. 2; $2.85-$3.29 for Domestic, and $2.40 t o$2.85 for No. 3, f. o. b. coach, Fredericton.

"It would seem that there is no connection between price and demand of apples, the public are going to have them at any price. The only desert apples offered on New Brunswick markets after December 1st have been Western boxed at a wholesale price of $3.50 or more per box. There is no reason why our McIntosh, Wealthy, Fameuse and Pippins should not supply this local demand. Again, as in the berry growing, we must be organized and devote our energies to better fertilizing, pruning, spraying and grading produce apples of quality that the public wants and is willing to pay for.

"Our Horticultural Department, under Mr. Turney, has accomplished a great deal. Much of the work is educational—calling on individual growers and giving pratcical advice and help in looking fter their plantings. In so doing, this Department, while not being able to show tangible results in dollars and cents, yet is doing a work that we must concede is greatly needed and demonstrates that the Department is justified for this purpose alone. For the future welfare of the province it is the duty of this Association, through our Department to make it known that fruit can be grown on New Brunswick farms and, secondly, that large portions of the Province are as well adapted to the production of fruit as other crops.

"Through the efforts of our Department we are now able to buy nursery stock from Provincial nurseries. Our local nurseries, with assurance of recommendations from the Department, have increased their supply and offer all suitable varieties in excellen quality.

"Another feature in the policy of the Horticultural Division that is highly commendable is the establishment of commercial test orchards in different parts of the province, with the best men attainable, in order to get detailed information as to cost of growing, time for development, and comparisons in methods of handling.

"Some years ago the Horticulturist prepared a bulletin on 'Orchard Opportunities in New Brunswick.' This was revised in 1914, but the issue soon became exhausted and with the additional knowledge we have today, I think that a new and revised issue is advisable. In this conection it would be a benfit to point out the opportunities for bee-keeping.

"Probably nothing has appealed to our members as much as the co-operative shimpments of apples so ably organized by our secretary. The return has been satisfactory and the rapid handling enabled growers to clean up their crop early in the season. It is to be hoped that the shipments will be continued another year.

"Another feature is the purchase of all kinds of suplies for our members at cost price. In this conection I would point out that there is a prevailing idea in some quarters that it is the Government who handles these supplies and is cutting into the retail men. Other reports are that our secretary is acting as agent for the manufacturers and pushing certain lines on the growers. These inferences are due partly to the fact that the secretary is a Government official, but I wish to assure the members that the business of the Association is done through the executive of which sercretary is a member, and not through the secretary alone.

"In conclusion, let me ask each of you present to enter fully into the spirit of this meeting. The subjects we will discuss are most helpful only when everyone hase their say—our welfare is mutual. If there is anything you have to ask about fruit growing, the asking and the aswers will benefit not only yourself but the others present."

Provincial Horticulturist Presents His Annual Report as Secretary-Treasurer of the Association.

Mr. A. G. Turney, the energetic secretary-treasurer and provincial horticulturist, then read his annual report, which was as follows:

I beg leave to submit my report, which is divided into two parts, the first dealing with the secretarial and general work of the association and the second, with the financial statements.

This association, which was organizen in 1902, continues to do good work for the advancement of fruit growing in New Brunswick. Encouraged by the active sympathy and support of the Department of Agriculture it has steadiyl increased its membership. The growth in this respect is as follows: 1905, 34 members; 1906, 37 members; 1907, 37 members; 1908, 30 members; 1909, 24 members, 1910, 79 members; 1911, 115 members; 1912, 72 members; 1913, 113 members; 1914, 122 members; 1915, 91 members, 1916, 110 mebemrs; 1917, 151 members; 1918, 128 members.

During the past year the association continued the co-operative work of supplying its members with nursery stock and spraying materials and supplies, and distributed goods to the value of $3,000. The supplies handled consited of lime sulphur, soluble sulphur, arsenate of lime, hydrated lime, Black Leaf 40, Paris Green, bluestone, power and hand-spraying outfits, pruning shears, barrel presses, berry boxes and crates, apple barrels apple boxes, wrapping and lining papers, venner tree protectors and nursery stock.

It is with a good deal of satisfaction that I call your attention to the gratifying financial position of the association—the bank blance of October 31st, 1918, plus the excess of assets over liabilities giving us approximately $1,370. I am not one who believes in accumulating a balance at the expense of carying on important work but as yet we are hardly open to this criticism for a substantial balance is necessary to the most advantageous purchase of materials, and it must be remembered that one-half or more of our value is always in outstanding accounts and supplies carried in store. However, Ithink we have about reached the time when the association can begin the development of a still more ambitious and useful programme and this is a matter which I hope may receive proper consideration before the members now in attendance leave for their homes.

Rated as Agricultural Society

Some years ago I made application to the Superintendent of Agricultural Societies for the granting to this association of a charter as a regular Agricultural Society, so that we might have all the privileges and protection which they have, and receive a regular annual grant based on our membership. I think you will agree that as an organization we are, to say the least, as active and energetic as any of the regular Agricultural Societies and deserving of equal encouragement.

At the last annual meeting I was appointed a delegate to represent the association and New Brunswick at the Conference of Dominion Fruit Growers to be held at Ottawa on March 26th and 27th. Accordingly I attended the meeting which I am glad to report was most successful.

During the past ten years previous conferences and various provincial and local meetings of fruit growers had from time to time discussed and suggested certain improvements to the conference was to complete that work and crystalize it into definite recommendations for enactment into legislation at the coming session of Parliament.

The late Mr. D. Johnson, then Dominion Fruit Commisioner, presided at all the sessions and was assisted by Messrs. C. W. Baxter, G. E. McIntosh and F. H. Grindley, members of his staff. Representatives and inspectors from the different provinces, together with representatives of the barrel, box and basket manufacturers constituted the conference of about thirty-five members.

The ease and dispatch with which apparently conflicting views were harmonized and questions of years of contention were amicably settled enabled the meeting to crystalize in two days matters that had drifted on for years and to pass resolutions the substanace of which became law on May 24th, as amendments to the Fruit Marks Act. These resolutions in detail may be found on pages 105-107 of the Report on Agriculture for 1918 and no doubt reference to some of them wil be made later in this meeting.

In the untimely death of Mr. D. Johnson, who did much to bring about the amendments to the Fruit Marks Act, the fruit growers of this province and the rest of Canada lost an able, energetic and prudent admistrator. Those of us who were privileged to have met and known Mr. Johnson feel that his death had removed a warm personal friend, and an enthusiastic, whole-hearted worker in the interests of the Canadian fruit industry.

Summer Field Day Advocated

For some years I have felt that the Association might, with advantage to its members and the fruit industdy, hold a ummer meeting in the form of a field or inspection day. Such a meeting would afford growers an opportunity of seeing some of our best

(Continued on page 761)

Farm Notes From Nova Scotia

OPTIMISM IN THE CREAMERY BUSINESS

During the past month a number of Nova Scotia Creamery organizations held their annual meetings. As many as possible of these were attended by representatives of the Dairy Branch at Truro. In every case renewed interest was manifest and optimism expressed regarding the future of the business.

The Antigonish Dairy Company held its meeting on March 5th. The reports shewed an increase in business during the year. To encourage herd improvement among its patrons a resolution was passed authorizing the payment of a bonus of $5.00 at the end of the season to each person who will carry on cow testing during the year.

The Pictou Co. Cooperative Creamery Co. met on the 6th. It was decided by way of a forward step to hold a monster picnic during the summer for its patrons. A substantial grant of money was also voted for the encouragement of cow testing.

On the same date the Cumb. Cooperative Creamery Co., held its annual meeting at River Hebert. This Company has been fighting for existence for a number of years; but this year it recorded an incerase in business of over 50%, which puts it on a good working basis, and the prospects are bright.

The La Have Creamery Co. met at Bridgewater some three weeks earlier. This company has become the second largest in the Province, and the people of the district are determined to make it the largest. In no place is there greater enthusiasm over dairying than here.

The Scotsburn Ceramery Co. met on March 11th. This Company has developed from a business of $4,000 in 1908 to a business of $200,000 in 1919. Probably in no place has a company realized so fully the importance of close cooperation between the company and the milk producer, with the result that, among those who have taken advantage of it, a great increase per cow has been made. Plans are being developed for yet more strenuous work this year.

A number of companies have not yet held their meetings, but there is good spirit everywhere, and a keener realization of the fact that the interests of producer and manufacturer are really one, and their welfare must be sought in common.

POTASH ON POTATO LAND

Potato growers will be interested in an experiment carried out by the Horticultural Division of the N. S. Dept. of Agriculture, Truro, during the season of 1918. The main object of the experiment was two-fold: To ascertain, 1. Is Potash so necessary an ingredient in the production of potatoes that it can be profitably used at the extremely high price which is now commands? 2. If it should be used, what quantity per acre is best and most profitable?

Former experiments at the College indicated that no great benefit is to be derived from the use of Potash on lands which had in previous years been liberally supplied with barnyard manure, and were therefore well furnished with this ingredient. The 1918 experiment was tried on land that is naturally poor, a light sandy loam which had been in pasture for a number of years.

Two kinds of fertilizer were used in the experiment, a home-made and a commercial mixture, both containing throughout 3% Ammonia and 10% Phosphoric acid. Each of these mixtures was divided into four parts, one of which was used as it stood, i.e., as a 3-10-0 mixture. The other three lots had varying amounts of muriate of potash added to make mixtures containing 1%, 4% and 10% of potash. The four lots of fertilizer used, then, may be designed as 3-10-0, 3-10-1, 3-10-4 nd 3-10-10, in both the home-made and the commercial forms.

The plots were each 1/16 of an acre in size and the fertilizer was applied at the rate of one ton per acre, no barnyard manure being used. The varieties of potatoes grown were Irish Cobbler and Dreer's Standard. Throughout the season a difference could be clearly seen in the appearance of the plots. The foliage of the potatoes on the plots to which no potash had been applied was greenest in colour, and the growth was tenderest when the fall frosts came. Those to which fertilizer containing potash was applied were lighter in colour and less injured by the fall frosts. The ripening of the tops reached a higher degree where potash was used, and was greatest on the plots where the greatest amount was applied.

The following tables show the yields cost of production and net profit per acre of the different plots.

HOME MIXTURE

3-10-0 ...	249.23	$232.94	$89.00	$36.08	$125.08	$107.86	
3-10-1 ...	238.175	231.00	89.00	41.08	130.08	100.92	$6.94 Loss
3-10-4 ...	283.16	266.75	89.00	56.08	145.08	121.67	13.81 Gain
3-10-10 ..	321.06	304.39	89.00	86.08	175.08	129.31	21.45 Gain

COMMERCIAL MIXTURE

3-10-0 ...	235.39	$218.99	$89.00	$45.00	$134.00	$84.99	
3-10-1 ...	228.36	215.79	89.00	50.00	139.00	76.79	$8.20 Loss
3-10-4 ...	250.845	237.45	89.00	65.00	154.00	83.00	1.99 Loss
3-10-10 ..	297.355	280.55	89.00	95.00	184.00	96.55	11.56 Gain

Detailed cost per acre of growing potatoes.

Preparation of land and drilling	$8.00
Planting by hand	10.00
Seed, 15 bushels at $1.40 per bushel	21.00
Cultivating	8.50
Spraying, 5 times	12.50
Weeding out cadlock by hand	7.00
Digging and harvesting	22.00
	$89.00

Detailed cost of Fertilizers—Home Mixture and Commercial Brand.

Home Mixtures.		Commercial Brand	
Nitrate of Soda	$110 per ton	Commercial 3—10 fertilizer	$45 per ton
Acid Phosphate	$30 per ton	Muriate of Potash	$250 per ton
Muriate of Potash	$250 per ton		
Home Mixture 3—10—0		**Commercial Brand 3—10—0**	
330 lbs. Nitrate of Soda	$17.33	2000 lbs	$45.00
1250 lbs. Acid Phosphate	18.75		$45.00
1580 lbs	$36.08		
Home Mixture 3—10—1		**Commercial, 3—10—1**	
1580 lbs. as above cost	$36.08	2000 lbs. as above cost	$45.00
40 lbs. Muriate of Potash	5.00	40 lbs. Muriate Potash	5.00
	$41.08		$50.00
Home Mixture 3—10—4		**Commercial, 3—10—4**	
1580 lbs. as above cost	$36.08	2000 lbs. as above cost	$45.00
160 lbs. Muriate of Potash	20.00	160 lbs. Muriate of Potash	20.00
	$56.08		$65.00
Home Mixture 3—10—10		**Commercial, 3—10—10**	
1580 lbs. as above cost	$36.08	2000 lbs. as above cost	$45.00
400 lbs. Muriate of Potash	50.00	400 lbs. Muriate of Potash	50.00
	$86.08		$95.00

Price of Potatoes

Marketable table potatoes were sold for $1.00 per bushel.
The small potatoes were sold for .50 per bushel.
Both grades are included in the returns from each plot.

While the results of the experiment cannot be fully set forth except in a rather elaborate tabular form, the main facts brought out are these. 1. That the application of potash in considerable quantity on certain soils, even at the present high prices, pays well. 2. That the application of small quantities on the same soil and with the same conditions gives so little results as to be practically lost. To be more specific—The addition of 1% of potash increased the cost of the fertilizer $5.00 per acre, while no gain in yield occurred. The addition of 4% of potash increased the cost of fertilizer $20.00 per acre, but the yield showed a corresponding increase of some 35 bushels per acre, thus more than compensating for the added cost. The addition of 10% of potash, increasing the cost of fertilizer by $50.00, resulted in a gain of about 70 bushels per acre.

These results are only from one year's test and are offered for what they are worth. It is worthy of note, however, that legislation has been enacted in several States of the Union prohibiting the sale of fertilizer containing less than 2% of Potash.

NOTES FROM THE COLLEGE OF AGRICULTURE, TRURO

The Cheese Makers' and the Milk Testers' courses, which ran concurrently from March 25th to April 3rd, have passed off successfully. Mr. H. W. Coleman, Dairy Superintendent of New Brunswick, and Mr. F. T. Morrow, Dairy Inspector for Prince Edward Island, were instructors. In the Milk Testers' course Mr. H. R. Brown was the instructor in charge. Mr. Brown is Supervisor of Cow Testing Associations in Nova Scotia.

Students in Attendance.

Cheesemaking Course, March 25th to April 3rd, 1919:—

Fred Myers, Malagash, R. R. No. 1, N. S.; B. R. Keith, Butternut Ridge, N. B.; Fred Fawcett, Killams Mills, N. B.; Miles Perry, St. John, N. B.; Harry Parlee, Folkins, N. B.; Albin Gallant, Mount Carney, P. E. I.; Heber McQuarrie, Summerside, P. E. I.; John Murcheson, Orwell, P. E. I.; A. W. Jones, Hazelbrook, P. E. I.

Milk Testers Course, March 25th to April 3rd, 1919:—

Herbert Murray, River John, R. R. 3, N. S.; Walter W. Smith, Shenimicas, N. S.; Miss Mary Fraser, Lower South River, N. S.; Patrick Hebert, Rogersville, N. B.; Urbaine L. Breau, St. Anthony, N. B.; Arthur H. Daigle, St. Charles, N. B.; A. C. Cock, Waldegrave, N. S.; Mrs. A. C. Cock, Waldegrave, N. S.; Miss McConnell, Antigonish, N. S.; Miss K. McArnias, Antigonish, N. S.

STANDRADIZATION OF FARM MACHINERY

Years ago the apples of the Annapolis County Valley were put into barrels and shipped to England practically as "run of tree." What price did these aples bring? That they sold at all was due to the fact that all apples in competition were packed in the same way, that is to say there was no particular grading of apples in those days. The same conditions obtained in the shipping of other fruits, vegetables and grains. Without following the grading or standardization of these foods just remember how they are sold and marketed to day.

Wheat, for instance, is graded and sold acocrding to standard, and pretty much all other farm crops are sold in same way. Butter, and all products of the dairy are today standardized. We all know the benefits derived.

Why not then adopt a standard in the manufacture of farm machinery of all kinds?

War measures forced the great milling companies of Canada to remodel their machinery so as to produce a standard grade of flour. The United States of America, which manufacture, use and ship more farm machinery than any other country in the world, appointed what is known as the United States Commercial Economy Board of the Conservation Division of War Industries Board. This Board in co-operation with the manufacturers of machinery made recommendation that practically 2,000 styles of the various implements could be eliminated from manufacture.

I have here the list of implements the manufacture of which the Board recommended to be discontinued and the dates when manufacture ceased.

Another illustration of standarization is the wooden and steel shipbuilding such as prevails at the Hog Island yards, one of the largest steel ship building plants in the world. I might also mention the evolution of the Liberty Motor.

Last winter a delegation from the British Government visited New York for the purpose of discussing possible co-operation between the two Governments in standardizing motor trucks, airplanes and other equipment. If the war had continued these and other reforms would have been accomplished. There is, however, no reason why this movement should not be developed in the arts of peace.

One of the main ideas of this movement is to lessen the cost of selling repairs. Instead of several merchants and implement dealers carrying repairs, one merchant or blacksmith could carry repairs that would fit any machine, wagon, motor or implement. At present a farmer has to purchase these repairs from the agent for the particular kind of machine he sells. This often means los of time, crop and money. One reason for the vicious system at present in vogue is that agents, encouraged by the implement manufacturer, try to make

(Continued on page 786)

Potato Grading and its Relation to Market Prices, Transportation and Consumption

Address by Guy G. Porter, of Perth, N. B., at the Recent Potato Growers' Convention, Woodstock

I want to congratulate the potato growers of this Province on the advances they have made in the potato industry, during the last few years. Two reasons which help your position greatly, are undoubtedly, our suitable climate and soil. A great deal of credit is due to the pioneers in the potato industry of this Province and also to the efforts of the working heads of the Association. Neither climate nor soil will produce potatoes without hard work, and hard work, unless properly directed and coupled with scientific knowledge, will not produce the results we are striving for.

Grading and its Relation to Seed Selection

We must select our seed with the utmost care, being sure to use nothing but sound tubers, of medium size, free from all diseases. We must also select seed of straight varieties and true to type. We are cursed in New Brunswick, to a very large extent, by planting mixed varieties, and as a result, we are at the present time, receiving from 10c. to 30c. per hundred pounds less for our potatoes in the large consuming markets than the Aroostook County Shippers, who pay more attention to seed selection and the planting of straight varieties. Our seed potatoes are not only mixed, but as a rule, are grown from weak seed, and are of poor eating qalities. Certain varieties of potatoes are better to eat than others, just as certain apples are better than others. Moreover it is possible to grow varieties for boiling, others for baking and still others for starch. The production of potatoes of good eating varieties would not only be a surprise to 95% of our population but would increase our per capita consumption of this article. We have found the good eating apples, but we have neglected the good eating potatoes. Uniform and shapely potatoes are much more economical than the general run of mixed and unshaped tubers now found in our market, because they can be peeled thinly with the minimum percentage of waste and the best food elements of the potato lie close to the skin.

If you plant mixed varieties and unshoped potatoes you canot help but raise a mongrel crop, and it is impossible for the farmer to deliver to the potato buyer a good, clean, smooth crop from such seed. He will have a crop of mixed varieties, all shapes and sizes, including cuts and damaged tubers and marbles which should have been kept on the farm for stock feeding. The consumer has been getting a large percentage of trash in his potato basket, and there is little wonder he only eats the equivalent of one normal potato daily. And there is little use of asking him to eat more unt liwe can make it worth his while in better quality and value.

Therefore, let us begin to grade our potatoes, by selecting the seed properly.

Grading and its Relation to Proper Cultivation

It is of course important that good, clean ground be selected, in which there are no contagious diseases carried over from season to season. All good farmers, I believe, recognize the importance of frequent and thorough cultivation. In dry seasons this conserves moisture and in wet seasons it prevents an abundant growth of weeds. By properly cultivating the potatoes are hilled up so that we get a minimum of sun-burn and frosted potatoes when digging. Any potato crop which is not properly cultivated will be stunted in growth. Therefore, cultivation is highly essential, and bears directly on the quality of the potatoes to be harvested. If you get s smal, stunted growth, it is impossible to grade them properly, for the general average is small, and even by throwing away a very large percentage of the small potatoes, it is impossible to have the balance present a good appearance.

Spraying and its Relation to Grading

From my observation and experience, I believe it is impossible to raise a good, clean crop of potatoes, without proper spraying with Bordeaux Mixture. It has been estimated by scientific men connected with the potato industdy of this Province that 25% of our crop is lost through preventable diseases, which could be controlled or almost eliminated by proper spraying. It has been shown beyond all doubt, that proper sprsying increases the yield from 5% to 20%. Increasing the yield means potatoes of better size and quality. I fully believe that the increase in yield alone, from thorough spraying, will more than pay for the cost of spraying, and I also believe that the quality will be improved very materially. Improvement in quality is just as necessary as increase in yield. And I am strongly convinced that only as long as we produce the best quality of potatoes possible, with all our advantages of soil and climate, will be able to hold first place in the potato industry in Canada. Potatoes properly sprayed will keep muhc better in storage. I han an instance in our own business this fall, where we stored a carload of potatoes from a certain section, and the potatoes looked to be in first class condition, when put into the warehouse in October. We loaded these potatoes out about three weeks ago, and were surprised to find that nearly 20% of the potatoes were affected with dry rot. We took the trouble to find out who loaded these potatoes and found that they had not been sprayed. This convinces me that spraying is not only necessary, but profitable. As one of the most difficult jobe we have in grading our stock for market is taking out the drp rot, which can be prevented by proper spraying.

Digging and Delivery to Warehouse and its Relation to Grading

I believe that fully 10% of the entire potato crop of New Brunswick is spoiled by rough handling between the field and the shippers' warehouse. Many farmers and warehouse men handle their stock so roughly that the entire value of the crop depreciates fully 10% from bruises, cuts, cracks, etc., which later develope dry rot and deterioration. By rough handling, the nice, sound, smooth appearance is lost, when the potatoes are delivered at the buying point. Estimating the potatoc rop at ten -million bushels, and estimating the price as low as 50c. per bushel, the farmers are losing half a mililon dollars anually by rough handling. This amount of money which is lost through careless handling would pay the expense of selling the entire crop under proper organization. I advise you, gentlemen, to handle your potato crop more carefully, and cut out this unnecessary waste. The potato crop is one which can be raised profitably in this Province, providing the waste in raising and marketing can be eliminated. This 10% waste in handling, if converted into dollars and cents, would pay the interest on the debt of the Province every year. It is therefore important, specially at this time of general economizing, that both farmers and shippers elarn something about economy in the handling of their potatoes.

Grading and its Relation to Market Prices

Until very recently the farmers in this province made little or no atempt to grade their potatoes properly before bringing them to market. Competition has been so keen between the buyers that until last fall thy paid little attention to grading. The potato shipper seems to be afraid to be particular about the quality and size, fearing that he may drive his customer to some other shipper, who would accept the poor quality without protest. He overlooks the fact that in accepting the load of poor potatoes, he does an injury to the farmer who is bringing to market first class stock. He dumps them all in the same car together, and, as a result, the good stock which should have graded No. 1 is mixed with the poor stock, which would grade No. 2, and the whole car is thereby made nothing better than No. 2 grade. We all know that it is impossible to get the top price for a poor article. While on the other hand, a good article always brings the top price in any market, so in order to keep up the reputation of New Brunswick, and the potato industry of this Province, we must co-operate and work out and maintain a satisfactory method of grading. The growing end and the shipping end of the potato business, are separate and apart. So much so, that the growers generally take all the profit, and put the shippers in for all the losses. Still the interests of the potato growers and shippers are so closely connected, that the closest co-operation concerning quality and grading, would undobutedly be of advantage to both. Interlocked with these interests again, are those of the buyer and the consumer, whose money, we have to depend upon to keep the industry going. I can show you today, where New Brunswick potatoes are selling from 10 to 30c. per hundred pounds lower than Aroostook County Graded Stock, simply becouse our varieties are mixed and our stock is not properly graded for size. This has a direct bearing on the market price, and if we expect to stay in business and compete with other potato-growing sections, we must grade our potatoes properly so that we can get the top price.

I believe the best Grader we have on the market today is the Boggs Potato Grader, which is a very simple machine, belted with a wire mesh of suitable size, and grades No. 1's, 2's, and 3's at the same operation. The old fashioned system of grading over a hand rack is obsolete and does not give a unform grade. In using the old-fashioned hand rack you leave the grade entirely to the opinion of the individual at work, and I have found from running a number of houses, that the judgment of the men using the hand rack, varies very materially. In fact, so much so, that you would not recognize the grade as being similar to the grade put out at another house. It is impossible to grade potatoes economically and well on the old-fashioned rack. You have to depend upon your eye and your hand. You are either throwing out too many large potatoes, or not taking out enough small ones. I am therefore convinced that a system of mechanical grading is the only proper method.

About twenty-five years ago an organization of farmers on the Eastern Shore of Virginia formed themselves into a corporation wnown as the Eastern Shore of Virginia Produce Exchange. For the first few years they marketed their potatoes ungraded in the large cities up and down the Atlantii Coast. Their potatoes went on the market at a very opportune time, beginning about the 1st of June and finishing about the 1st of September, at a time when Northern grown stock did not come in competition. Nevertheless, it was not long before they conceived the idea that they should be selling their potatoes according to grade, and about ten or twelve years ago they decided to grade their potatoes No. 1, 2 and 3, and have continued to do so ever since. This was long before any compulsory grading in the United States was ever heard of. Last year this organization sold upwards of 3,000 carloads, and their New England salesman told me a few days ago that he only had two rejections in the New England territory last season. This goes to show that the buyer has confidence in the grade and is willing to pay the top price. Compare this with our system of shipping out anything and everything as we do from New Brunswick, and I believe you will decide that in order to get the top market price for potatoes we must first grade them.

I have seen potatoes from every Province in Canada and can say without hesitation that if our potatoes were graded, they would be in a class by themselves, but as they are today, being shipped ungraded to the different markets, we are finding it difficult to hold our own, and unless immediate steps are taken to put a better grade article on the market, we will not be able to compete with other potato growing sections. I might also state that the South Carolina Produce Exchange started in eight or ten years ago to ship ungraded potatoes. These potatoes went on the market, chiefly in competition with Virginia stock, which at that time was graded. The South Carolina people found they could not compete and hold their customers by shipping ungraded stock. They therefore decided about four years ago to grade their potatoes, and have continued to grade ever since with satisfactory results.

Transportation and its Relation to Grading

We very often have a car shortage in this province and very often this car shortage comes at a itme when we are most anxious to ship. Our firm has often been hard up for cars at a time when we would have anywhere from one to five cars turned down at destination on account of improper grading. This means a delay of anywhere from two days to three weeks in the unloading of cars. The consignee simply refuses to accept the car unless a special reduction in price is made. This generally takes from two days to a week, as the shipper must first satisfy himself that the reduction is warranted. He must inspect the car and finally arrange with the consignee, or some other buyer, to take the car over at a reduced price. This ties up the Railroad equipment, which is directly an injunry to the shipper, and besides this, the shipper generally has to pay the demurrage at the other end, which now runs from five to ten dollars a day, after the car has been at destination over five days.

Proper grading would eliminate these rejections and give us a better and omre regular car supply.

Consupmtion and its Relation to Grading

The potato is a key commodity in the food situation. It furnishes bulk and nourishment for price as no other food commodity can do. During the war when an attempt was made to save wheat and meat, our food experts

THE CHILD'S EDUCATION

Some doubt it, some disbelieve it, but history points out that most of the successes in all walks of life go to those best fitted by education. Some succeed by what they have learned outside of schools. They succeed in acquiring much learning by hard work and close observation. Their path would have been easier, their success greater with better schooling.

An education is no guarantee that a person will be a success in any line he may choose. It is no insurance against failure if one tries to follow an occupation for which he has no liking or aptitude. Education does not always give judgment. But the educated man has the best of it in any undertaking, for he can the more readily acquire the knack and the knowledge necessary to do the thing in hand.

Too many parents leave the education of their children entirely to the teachers. A considerable number of failures in life are due to this lack of interest in the education of the children on the part of parents. The child gets discouraged because he cannot understand some of the things in class work. The teacher may not notice the cause, and the child soon drops out simply because the parents have not willingly given a little help and encouragement or have failed to back the teacher. When parents sneer at education, or run down the teacher, or use every little excuse for keeping a child at home, the best of teachers will fail to give that child an education. He is handicapped for life.

There must be the closest harmony between parents and teachers if the school is to fulfill its mission. The parents must know educational problems and help in their solution. You do not leave the planning and execution of farm work to the hired man. Take as much interest in the children as in breeding and feeding and housing the livestock, and the children will rise up and call you blessed in the years to come.

THE FARM INVENTORY

An inventory taken once a year will show the net worth of the farm. By comparing inventories from year to year the exact progress of the business can be found. Many times a farmer feels discouraged at the end of the year because his cash is short, when an inventory taking in growing stock and crops, and unsold products would show that a handsome profit had been made for the year.

In taking an inventory the farmer must go over all of his property at least once a year. In this way his attention will be called to the condition of his stock, machinery, etc., and naturally, needed repairs, changes, etc., will be suggetsed and made.

Another step in stopping leaks in the farm business is to keep a record of receipts and expenses of the farm throughout the year. From these and the inventory it is easy to figure not only the net worth but the profits and losses as well. March is probably one of the best months in the year to start this work.

PURE-BRED SIRES BUILD UP HERDS

A good sire is half the herd, a poor one nearly all of it, said a pioneer Texas cattleman at a recent United States Greater Production meeting, where purebred bulls were being discussed.

Fifty years ago the cattle of Texas were a lean, shaggy, ill-conditioned lot; today they are low set, blocky, white-faced animals of excellent quality. What has brought about such a change? Simply the consistent use of good purebred Hereford bulls. It was by a similar method that the Argentine built up her great beef export business, Denmark her extraordinarily profitable bacon trade, and Australia her world-renowned wool sales. Shorthorn bulls, Yorkshire boars, Rambouillet rams, purchased or bred at no end of trouble and expense, representing the best blood obtainable and used, consistently year by year—these tell the story.

It is true Canada has produced, and produces, purebred stock equal to the best of the North American Continent. But it is also equally true that the cream of our good isres, both dairy and beef,, regularly find a market across the border in the United States. This should not be, and until the Canadian farmers and breeders use the best at home instead of sending them out of the country, they cannot make the progress they should.

Canada has a great task ahead of her, especially in live stock fields. It will require new intelligence and determination on the part of live stock men. Competition will be very keen in the struggle for commercial positions. The continued use of scrub sires will make progress impossible and defeat the purpose. The future of Canada's business is dependent upon the use of purebred sires. The best beef, the best bacon, the profitable production of milk and butter, cheese and eggs can be insured in no other way.

FARM YARD SPRING CLEANING

Though the farm home has unique surroundings for a healthy atmosphere it is often impaired by the accumulation of filth and debris around the buildings. Such accumulation of foreign matter is often the cause of disease and epidemics, both to man and beast. They act as breeding places for such and are the propagating hotbeds for all things that poison healthy life. How often one finds, when visiting a farm home, a pile of dirt alongside some building that is not only an eyesore to the place, but a source of danger to health. Pools of stagnant water, seepage, decaying carcasses of animals and such refuse are invaraibly found around farm places. Not only are they a source of contamination, but they spoil the general appearance of the place. There is nothing that mars the beauty of a home like a heap of rubbish here, a broken implement there, a broken fence, gate or door, or water hole close to the buildings. They make good shelter for weeds that never lose the opportunity of establishing themselves. As summer goes on thees weeds grow in abundance and it is very difficult to cut them down on account of all the rubbish that is around them. The result is, they are allowed to grow, ripen and disseminate their seed, and next year there are more weeds than ever.

It does not require much labor and very little expense to tidy up the farmyard, and the change in appearance is worth far more than the labor. It does not need much exertion to remove a pile of broken boards or old implements, either by carting away or burning when not in close proximity to the buildings. A day spent in rebuilding broken fences and gates around the buildings, nailing on the boards that have fallen out of the gable end of the shed, putting a few nails or a bolt in that loose hinge on the barn door will go a long way towards improving general appearance and utility. Moreover, when this has been done, the owner and his family will take more pride in their home, and that has a great deal to do with keeping people contented and happy. Perhaps a little paint can be used to advantage, and not cost much. If the job is not too big perhaps the farmer or the boys can do the painting during spare hours in spring and thus save on the labor bill. All these things tend to brighten up the farm home.

Then there is the very important item the health of the farmer's family, which must be protected. Cleaning up the place will do a great deal towards this end. It is well known that filth and rubbish forms an ideal breeding place for flies, and they carry disease into the home.

A couple of days spent in cleaning up the surroundings before spring seeding starts will make a great difference in the appearance of the place. Two men, a team, wagon, and a bonfire will do a great deal in a day, and then it is done for the season. Tidiness is a great asset to anyone, but more so to the farmer, and as a rule it is those same farmers who are satisfied with their calling and are not offering their farms for sale. The pride taken in a neat and tidy home is worth considering, and no better use can be made of a couple of days before seeding than cleaning up the farmyard.

* * *

SIZE OF THE FARM

Some of the brightest young men among those I know best pin their faith firmly to the modern science of farm management, and that is to me evidence of its dependability—in very considerable degree. They tell me that the average farm is too small for best results. The surveys show that it is the relatively large farms that give the good labor incomes to owners. Doubtless this is the rule, but I should like to know how much of this success is due to the big acreage within the farm, and how much ot the type of man who has the trick of succeeding and expresses his success in added acres. If the farm management man who gets the data about the farm took with him a psychologist to examine the owner the results would appear to me more authoritative and conclusive. However, that may be asking too much; our debt to this new science even now is great.

"To provide supplies we must build up reserves. The first reserve in dairy products is the maintenance of our herds."—Herbert Hoover.

* * *

When planting an orchard, remember that it is a permanent investment and no pains in the preparation of the land or reasonable expense of the purchase of good trees, should be spared.

NEW BRUNSWICK FRUIT GROWERS IN ANNUAL CONVENTION

(Continued from page 757)

orchards and observeing in the growing season points of orchard practice discussed in winter meetings. Representatives of Boards of Trade and the press and leading business men might well be asked to take part in such a meeting, as it would surely give them a better and bigger idea of our fruit growing capabilities and result in advertising of benefit to the industry. I would like to see the meeting give a free expression of opinion on the suggestion.

I desire to call the attention of members to the fact that the prize money allotted to apple exhibits at the forthcoming Fredericton Exhibition has been materially increased. In view of the absence during the past few years, of opportunities for displaying the products of our orchards, growers should make an extra effort this year to see that all fruit classes are well and creditably filled at the exhibitions, and particularly at this one, because the advertising thus secured is of prime importance, not only to the fruit industry, but to all of the province.

I wish to take this oportunity of expressing my appreciation of the cooperation and friendly feeling shown to me in my work as secretary-treasurer and to again point out that the most beneficial results may only be obtained by each member taking as active an interest and part as possible in the work of the Association.

The Financial Statement

Receipts	$3,497.23
Expenditures	3,090.08
Balance in Rayal Bank, October 31, 1918	$ 407.15

Assets

Accounts outstanding, October 31, but since paid	$1,223.75
Accounts outstanding, October 31, and still unpaid, March 31, 1919	335.18
Supplies on hand	883.86
Total assets	$2,442.79
Total ilabilities	1,479.32
Excessof assets over liabilities	$ 963.47

Afternoon Session

Following the president's address and the secretary-treasurer's report an address was made by Mr. George E. Sanders, of the Dominion Entmological Laboratory, Annapolis Royal, N. S. Mr. Sanders stated that the spraying calendar, recommended to apple growers of New Brunswick this year, have been well tested out in the province during the past two years, and have given the best satisfaction of any and, that as far as liquid spraying was concerned, it would probably remain with slight variation, as the standard recommendation for some years to come.

A spirited discussion followed Mr. Sander's address in which many of the growers took the opportunity, through questions,to gain particular information which they needed on this subject.

The afternoon session opened shortly after two o'clock with Mr. G. H. Vroom, of Middleton, N. S., chief fruit inspector for the Maritime Provinces, as the first speaker and he gave a very interesting talk on the Fruit Marking Act, explaining the nature of the amendment to it passed last spring.

He referred particularly to the new standard apple barrel, and explained, in detail, the way this barrel should be constructed in order to complete with the requirements of the law, and at the some time turn out a first class and satisfactory barrel from all standpoints. Mr. Vroom also made reference to the high quality of the New Brunswick apples, especially of the varieties which are most suitable for growing here, such as the McIntosh, Fameuse and Wealthy.

Mr. W. S. Potts, Dominion fruit inspector for the City of St. John, was the next to address the meeting, and he referred to the condition of the New Brunswick apples going into St. John markets from up-river points. He pointed out that while there was still room for considerable improvement yet the growers were to be congratulated on the improvements of the pack made during the past two years. In the course of his remarks, he stated that something like 20,000 boxes of western apples had gone into the city of St. John during the past winter, for sale in the province. These apples, he further stated, while having a fine appearance and being in good condition and a fair qpality, yet they could not be considered in the same class for desert purposes as the New Brunswick McIntosh and Fameuse, and that, in the production of these varieties, there was a big opportunity for apple growers in New Brunswick.

A keen discussion followed this address in which Messrs. S. B. Hatheway, W. P. Fox, A. G. Turney and others took part.

Following this discussion, Mr. E. P. Bradt, Deputy iMnister of Agriculture, addressed the meeting and spoke very interestingly on apple growing in the St. Lawrence Valley, stating that clean crops was the best system of growing the young orchards from the time of setting out until the trees came into bearing and the sod-mulch system had given best results in the management of the bearing orchards.

Mr. Bradt also spoke of the necessity of thorough spraying and of the co-operative marketing of the fruit.

He also stated that the principal varieties grown in the St. Lawrence Valley were the same as ours, namely, McIntosh, Fameuse and Wealthy and that many of the growing conditions were similar to New Brunswick's. His remarks were of particular interest and value to the growers in New Brunswick.

Following Mr. Bradt's address the meeting adjourned to the Gaiety Theatre which through the courtesy of the manager, Mr. W. W. O. Feeney, a film was run off depicting apple spraying work and investigations in the Annapolis Valley, which was taken by the Dominion Atlantic Railway.

The picture was very timely and much appreciated.

The Evening Session

The first item on the programme at the evening session was a practicable paper on strawberry growing and marketing, by Lt.-Col. O. W. Wetmore of Cifton, Kings county, but owing to his absence on account of sickness his paper was read by the secretary and the discussion on it was lead by Messrs. H. H. Smith, of Hoyt Station, S.B. Hatheway, R.E. Floyd, of Bloomfield, A.G. Turney, and others.

The fololwing resolutions were then brought before the meeting and adopted:

"Whereas the New Brunswick Fruit Growers' Association, in annual convention, have unanimously decided to carry on a series of summer meetings to further the Fruit Industry of the province; therefore resolved that the Department of Agriculture be asked to lend all possible assistance to make these meetings a success."

"Resolved that this Association wishes to express its appreciation of the assistance given the fruit growing by the Provincial Horticulturist, Mr. A. G. Turney and his staff. We regret that under war conditions his staff of assistants has been so reduced that he has not time to give the required assistance.

"And further, resolved, that the Department of Agriculture be requested to increase his staff to the requir-ed strength."

This motion was moved by H. H. Smith and seconded by J. W. Vanderbeck.

"Resolved, that the New Brunswick Fruit Growers' Association, in annual convention, have unanimously desided that it is in the best interests of the Association, and the fruit interests of the province, that the association be incorporated under special charter of the Legislature and that an annual grant, in keeping with the importance of the industry which this association represents, be made for the further work of the association; and that a representative committee be appointed to lay the matter before the Government In case this cannot be arranged, then application be made to have this Association incorporated under the Agricultural Act as an Agricultural Society."

This motion was moved by R. E. Floyd and seconded by H. H. Smith.

"Whereas the production of soft fruits in the province is a very profitable sideline, especially on small farms, and the sale for this crop is confined at present to local markets, often resulting in gluts and lower prices than is warranted; and whereas it has been shown that the shipping of strawberries, especially to Montreal, can be carried on very successfully, and to an almost unlimited extent, giving prices that leave a very satisfactory profit to he growers; and whereas the basis of success of such shipping necessitates the better organization and instruction in picking and packing of the fruit; therefore, be it resolved that this association, through the oHrticultural Departmet, make every effort to engage the services of competent men to so carry on such organization and instruction that this line of production may be materially increased."

This motion was moved by Allan B. Dingee and seconded by T. A. Clarke.

The evening sesio nclosed with the election of officers for the ensuing year, as follows:

Hon, President, James S. Neill, Fredericton.

President, Lieut.-Col. O. W. Wetmore, Clifton Kings county.

Secretary-Treasurer, A .G. Turney.

Additional members of the executive, Messrs. W. B. Gilman, Fredericton and R. A. Fillmore, Burton. .

PLAYING THE PART OF A NEIGHBOR

The pure-bred bull in a community is a fine asset and farmers owning such animals should feel free to ask their neighbors a service fee for the use of the animal that is in proportion to its value as a breeder. Neighbors that bring their cows for service should be prompt in paying fees as this is only right; and it encourages others to buy pure-bred bulls. When a fine pure-bred bull is owned by a neighbor it gives a farmer with an ordinary herd of cows an opportunity to improve his stock and finally own a herd that is nearly pure-bred. It may not be necessary for every farmer to have pure-bred cows. Of course, there are not enough to go around. However, it is important to keep as good cows as possible and never neglect an opportunity to improve them by good breeding methods.

Never use a tin vessel in making Bordeaux mixture or other solution containing copper.

The AutoStrop Safety Razor marks as great an advance in shaving methods as the reaper over the old hand scythe. All that the modern mower has meant in convenience, comfort, and economy is realized in the AutoStrop Razor.

The safety construction of the AutoStrop Razor enables the novice to use it with the same ease and dexterity as the veteran shaver. The self-stropping feature gives him a clean, keen-edged blade for every shave; while throughout stropping, shaving and cleaning the blade remains in the razor, thus removing the troublesome necessity of taking the razor to pieces and assembling it again.

There's nothing to learn about the AutoStrop Razor. A man takes to it as naturally as a duck to water, and he gets head-barber shaves from the start. So sure are we of this that we offer the AutoStrop Razor with strop and 12 blades, complete in an attractive case, on the distinct understanding that if it fails to please you, the purchase price—$5 will be handed back to you without argument. Any dealer will be glad to let you have an AutoStrop Razor on this condition.

AUTOSTROP SAFETY RAZOR CO., Limited
AutoStrop Building, Toronto, Canada

AutoStrop Safety Razor

Nitrate of Soda--Its Nature and Use

By Frank T. Shutt, M.A., D.Sc., Dominion Chemist and B. Leslie Emslie, F.C.S., Supervisor Investigational Work With Fertilizers

Source and Composition.

Nitrate of soda, also known as Chile Saltpetre, as found on the fertilizer markets of the world, is the crystallized and purified product from extensive deposits of the crude nitrate (caliche), occuring in Chile, South America, whence it is shipped in 200 pound bags. This product is about 95 per cent pure and contains between 15 and 16 per cent of nitrogen, the element to which this material owes its fertilizing value.

The most Important Nitrogenous Fertilizer

Nitrate of soda is the most important and the most widely used of all nitrogenous fertilizers, chiefly for the reason that its nitrogen is directly and immedately available to growing crops. Since it has not to undergo any preliminary or preparatory changes in the soil, it is in a class by itself as regards efficiency and quickness of action; all other nitrogenous fertilizers, with the exception of nitrate of lime, (which is not on the market), must pass through some process of conversion in the soil before they are utilizable by crops.

Functions of Nitrogen as a Plant Food

Nitrogen as plant food is instrumental chiefly in promoting the growth of the vegetative parts, (stem and leaf) of crops and hence is more particularly valuable during the earlier stages of development. The nitrogen so stored in the tissues forms a reserve to be used later in the formation of seed and fruit.

From this property of available nitrogen, it will be evident that an excess of nitrate of soda or any similar source of readily assimilable nitrogen would tend to unduly prolong growth and possibly delay the maturing of the crop. Some crops are more particularly susceptible in this regard than others and the effect is more marked when there is a lack of phosphoric acid.

Nitrate of Soda as an Indirect Fertilizer.

Experiments have shown that nitrate of soda exerts an indirect fertilizing influence, in causing the liberation for crop use of potash from its inert stores in the soil.

Application.

Time and Method. From the fact that nitrate of soda is readily soluble and its nitrogen immediately available, this fertilizer, as a rule, is most economically employed as a top dressing to the growing crop during the earlier weeks of growth. A portion of the application may, however, be given at the time of seeding without danger of any appreciable loss through leaching, the remainder being subsequently applied in one or more top dressings to the crop.

In dressing the growing crop, broadcasting the nitrate should be done on a dry day, to avoid scorching the foliage.

Rate. The application per acre per annum may be from 100 to 400 pounds, the heavier dressing being used in market gardening and other intensive forms of farming, as in potato growing. For the ordinary farm crop on soils of average fertility, 100 to 250 pounds per acre probably represents the limits of profitable application.

If one half of the application, say 75 pounds per acre, is broadcasted and harrowed in at the time of seeding, the remaining half may be given as a top-dressing about two weeks after the crop appears above the soil. Or the first application may be made as soon as growth appears and a second some two or three weeks later. A single application should not exceed 100 pounds per acre. As far as may be practicable, it is well to conform to the practice of small and frequent dressings during the earlier weeks of growth, according to the crop's ability to utilize nitrogen. By this means loss through leaching will be reduced to a minimum.

Rate Suggested for various crops.

	Pounds per acre.
For grain crops	75 to 150
For hay and pastures	100 to 200
For corn (fodder) and turnips	100 to 200
For mangels, sugar beets, etc	150 to 300
For potatoes	200 to 300
For cabbage and similar leafy crops	200 to 300

Clover, alfalfa, peas and beans, though "nitrogen-gatherers" when well established frequently respond profitably to a small quantity of nitrate of soda applied during the initial stag-s of growt.h

The amount that can profitably be employed will naturally be determincd in a large measure by the character of the soil, the smaller dressings sufficing on liberally manured land.

Supplemental Use of Nitrate

As a supplement to low grade mixed fertilizers, containing only say one per cent of nitrogen, as well as to purely phosphatic fertilizers, such as superphosphate and basic slag, the use of nitrate of soda will usually be found profitable.

Symptoms of Nitrogen-hunger

When soil and weather conditions are unfavourable to the production of nitrogenous crop food (nitrification), early spring sown crops may suffer form a lack of assimialble nitrogen. If the young crop assumes a sickly looking yellowish appearance, it stands in need of nitrogen. An application of nitrate to such a stunted, starved crop will, in a few days, with a warm rain, change its colour to a deep green, a sure indication that the crop has obtained its required food and is again making healthy, vigorous growth. One of the chief advantages in using nitrate of soda is that is supports a continuous and vigorous early growth and that it will help the young crop to safely tide over a critical period arising from unfavorable weather conditions.

Storage and Preparation.

Nitrate of soda, as already pointed out, is extremely soluble and hence to avoid wastage should be stored in a dry, rain-proof building.

As received, it will in all probability be caked into hard lumps and masses. These should be broken down, by pounding or to a fairly fine powder, in order that the nitrate may be uniformly applied.

To facilitate distribution, especially when the application is of the order of 50 to 75 pounds per acre, the powdered nitrate may be mixed with any desired quantity of dry loam or sand.

Nitrate of Soda a Source of Plant Food

Though the principal function of the nitrogen in this material is to promote growth of the vegetable parts and its effects are frequently very quickly observable, nitrate of soda is not to be regarded as a mere stimulant; it offers plant food in the most acceptable form. Used rationally as indicated, it is an excellent and effective fertilizer. It is not a "lasting" fertilizer, but it is one that, other factors being favorable, yields a quick return on the investment.

Growing Pea-Fed Bacon Hogs in New Brunswick

By O. C. Hicks, B.S.A.

Pea-fed bacon and pea-fed smoked hams are a delicacy rare to the consumers of New Brunswick grown pork; though pea-fed home grown pork was produced last summer and marketed in each county. Present indications point to its becoming a quality common to our trade for pea-fed pork can be produced in all parts of the Province at low cost.

Farmers in each county who raise pigs cooperated with the Provincial Department of Agriculture to carry on a test during the summer of 1918, to introduce pasture crops for pigs that woulg dive cheaper pork production. The results of the test indicate that a highly satisfactory crop is a pasture mixture containing pease.

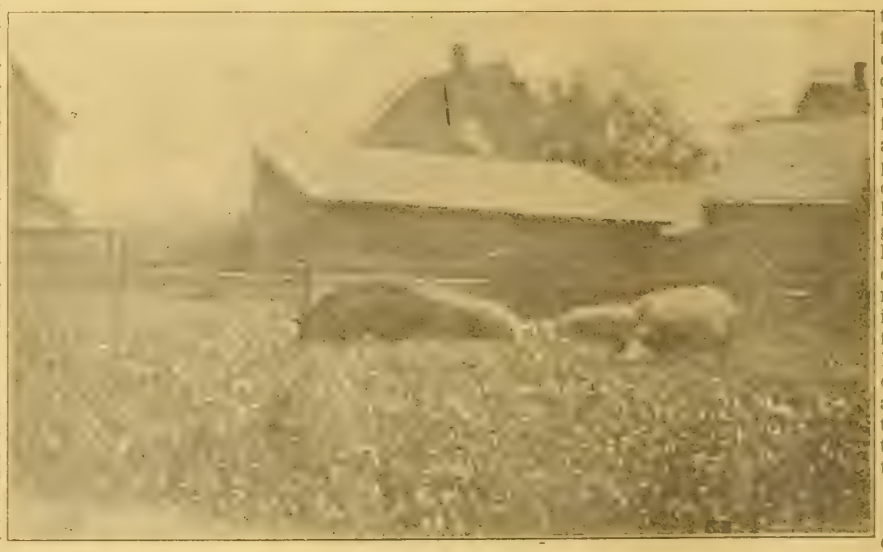
Forty-eight demonstration pastures were provided for and two hundred and forty-five pigs were pastured, while many more were fed in the pens upon green-cut rape, clover and pease.

Several popular breeds of swine were represented in the test, viz. Yorkshire, Chester White and O. I. C. Tamworth, Berkshire and Large English Black. The qeustion "which is the best breed as grazers"? cannot here he answered for in no instance were the weights of the pigs secuerd. But to the question do hogs make good grazers the answer is an emphatic "Yes".

Pasture Crops For Pigs

The plan of the cooperative tests included pasturing upon; Rape, Red Clover and three different grain mixtures, viz. (a) Pease and Oats, (b), Pease, Oats and Barley, (c) Oats and Barley.

Each experiment received sufficient seed for one acre of ground and a roll or woven hog fence-wire to enclose the pigs.



Good Pasturage Here.

The method of pasturing recommended was to divide the area into three parts and to pasture the pigs upon one section at a time. Thus a rotative system of pasturing was followed by which the part grazed off regained its growth while the other parts were being grazed and the pasturage was always fresh and succulent.

The test showed that pigs can be raised in large numbers without the cost of housing and that the out-of-doors mode of living contributes to an extraordinary thrift, cheap gains and consequently greater profit.

Location of the Pig Pasture

A favorable site for a pig pasture is one governed mainly by its convenience to the feeder.

Where a location can be had near the farm buildings and adjacent to a frequented farm lane, the thrice-a-day chore of feeding the pigs becomes an occasional pleasure only. An ideal situation for a pig pasture on many farms can be had by using the waste area of ground surrounding a duck-pond, swamp or spring brook so frequently an ugly feature of the farm lay-out. Such locations contribute a great deal towards maintaining the health and comfort of the pigs because of the advantage of the "wallow", so necessary a provision to their well-doing. Pigs perspire very little and suffer from heat, consequently a "wallow" and shade of some kind is needed. A rough shelter of boards or an area of bushes, or a large tree within the pasture to give shade and protection is an essential feature of a pasture.

The Preparation of the Pasture

A plan for pasturing pigs to be successful requires study beforehand, for other factors need to be considered besides the preparation of an area large enough for a given number of pigs and for a succession of pasture corps. A choice of successive crops can be planned to advantage only when the number and age of the pigs is considered. For example, one-half acre sown to rape in the first half of May would offer unsatisfactory forage for pigs littered during April, for by the time the pigs were 12 weeks old the rape would be so tough that only older pigs would graze on it, and for March born pigs, or for a late fall litter, the rape

would be in prime condition about the 15th of June.

Rape which is one of the best plants for pasturing pigs, requires fall preparation of the soil. This plant is a rank feeder, quite similar in this respect to the turnip or cabbage, and requires the same cultural methods. It grows most rapidly in the cooler months and consequently makes the best pasturage during the months of June, September and October.

A dressing of barn-yard manure applied either in the fall or early spring and harrowed in before sowing, produces a rapid growth of succulent forage. This crop grows but slowly during hot dry weather and when tough or stale it is less palatabel than the juicy young growth. Broadcasted sowing of this crop has the disadvantage that summer cultivation cannot be given, whereas sowing in rows two feet apart allows frequent cultivation to break up the hard paths along which the pigs have walked while feeding, and a fresh change of pasture can be given more frequently as the crop makes quicker growth. Five pounds of seed is ample for one acre sown in rows, while three times this quantity is used for broadcast sowing.

The replies received from different experimenters who pastured pigs on rape say that the amount of other food required by three months old pigs is less than half the amount ordinarily required and that old pigs will thrive on the pasturage alone. One correspondent, Mr. Jas. Easton, Chatham, says: "One-half acre of rape and one half acre of mixed grains had maintained eleven old pigs for three months."

Red Clover

Red Clover, the crop considered as forming the keystone of our agriculture has again proved its value as a pasture plant. For pigs of all ages red clover is the most satisfactory of any of the crops tested. It can be pastured very early, say June 10th in most places in the Province, and where the pasture is not overstocked ti continues to give good pasturage all summer. Several experimenters speak very highly of red clover as a pasture crop well suited to young pigs. Mrs. R. L. Hicks, Dalhousie Jct., pastured 6 pigs for 14 weeks on ¾ of an acre. Where a field of red clover can be had adjoining a piece of rape the combination is ideal for rapid growth and cheap gains.

Grain Mixtures for Pastures.

One of the essetnials to produce a good pasture with any grain or mixture of grains is that it must be sown thickly, consequently the quantities used per acre in these experiments was greater than is used in ordinary practice for grain growing. The experiments indicate that the mixtures containng the heavier quantities of seed prove most satisfactory.

A mixture of oats 2 bus. and barley 1½ bus. was the lightest sow pasture crop and contained 123 lbs. of seed. (b) Oats 2½ bus. and peas 1½ bus., contained 175 lbs. of seed and Oats 1½ bus., Peas, 1 bus. and barley 1½ contained 183 lbs. of seed.

Of these mixtures those containing pease were most satisfactory.

Fall preparation of the ground for any grain mixture is recommended. The ground should be well manured so that a rank, quick growing crop will be produced.

Pasturing should begin before the growth exceeds one foot in height, otherwise it becomes so tough as to be unpalatable.

Mr. L. J. Green of Blissfield reported as follows for a pasture of oats and barley; Sowed the plot, three-fourths of an acre, on June 27th on sod. Eleven 12-weeks' old pigs were turned in when the crop was 10 inches high. A pound of middlings and 4 lbs. of skim milk per head was given in addition each day. The pasture lasted for 5 weeks.

The oats-barley and peas mixture was reported on by Messrs. McIntyre Bros., Sussex, as follows: One acre was sowed on spring plowed sod June 17th and pasturing begun 6 weeks later on July 24th. Twelve 5-mos. old pigs were turned out to graze and fed in addition ½ the usual quantity of mill feeds and 100 lbs. of skim milk daily. The pasture was divided into 3 plots and the pigs changed about every week. We consider the pasturing plan gives good value."

A plan for pasturage, proposed from the experiences gained last summer, for a sow and litter of ten pigs farrowed, say April 5th, would include pasture upon Red Clover, peas and oats mixed, and rape for fall pasturage.

Approximately one half acre of each crop would be required. The clover to be of the previous year's seeding. The grain and rape to be sown on fall plowed sod or stubble. The peas and oats mixture to consist of ¾ bus. peas and 1¼ bus. oats for a half acre seeded down with clover and timothy. The date of sowing the 15th of May.

The rape to be sown the 20th of June in rows on soil well manured and prepared just as for turnips when sown on the flat, and 2 lbs. of seed used to the half acre.

The pigs to be eleven weeks old when turned on to clover at the time the clover is coming into bloom, about June 20th. They will not thrive on the clover alone and should receive for a time nearly the usual quantity of slop. Shelter should be provided in one corner of the field.

The half-acre of clover will give excellent pasturage for two weeks, or until July 1st, when the area sown to oats and peas on May 15th will be ready. At this time the young pigs may require to be ringed—in two weeks the pigs can be changed back upon the clover which will have regained a good strong growth and remain there two weeks or until the rape, sown June 20th is 6 or 8 inches high, or after August 1st. During this period the pigs will make rapid gains with but one half the grain and milk ration and while they are on the rape and clover alternately during August and September less than this will keep them growing well. They should receive at all time plenty of water.

This pasturage plan is suited to Kings, Charlotte and Madawaska, and parts of Westmorland. The dates of sowing should be one week earlier, in the counties of York, Carleton and Victoria, and in the remaining counties one week later than here outlined.

The results of the test last year proved that grazing was an economical method of growing pigs and the practice will be continued on the same number of farms. This year the Department of Agriculture will supply each of the experimenters with rape seed as it is proposed to try out this excellent forage crop on a more extensive scale.

How to Compare the Value of Fertilizer Materials

Sources of Nitrogen or Ammonia.

	Approx. price per ton.	Units or percentage of ammonia	Price per unit ammonia.
Nitrate of Soda	$125.00	19.5	6.41
Sulphate of Ammonia	153.50	24.5	6.27
xTankage	145.00	16.0	8.75

x contains 2 units of phosphoric acid worth $5.00

Sources of Phosphoric Acid

	Approx. price per ton.	Units or percentage of available phosphoric acid.	Price per unit of available phosphoric acid
Acid Phosphate	$32.50	16.	2.03
Basic Slag O.H.	22.00	6.	3.66

Source of Potash.

	Approx. price per ton.	Per cent of potash.	Price per unit potash.
Muriate of Potash	$200.	50.	4.00

By dividing the percentage composition into the price per ton, we get the cost of plant food in each material and comparison is then easy.

OR

We can determine the cost of a pound of plant food in the different materials. For example:

Sources of Nitrogen or Ammonia

	Approx. mar. ket price per ton	Percentage ammonia	Lbs. ammonia in ton=percentage multiplied by 20 (20—no. cwt. in ton).	Price per lb. ammonia= cost per ton divided by lbs. in ton
Nitrate of Soda	$125.00	19.5	390.	=32½ cts
Sulphate of Ammonia	153.50	24.5	490.	=31 1/3 cts.
xTankage	145.00	16.0	320.	=43¾ cts.

x contains 2.5% phosphoric acid worth $5.00

Sources of Phosphoric Acid

	Approx. price per ton	Percentage available phosphoric acid.	Lbs. available phosphoric acid per ton=percentage X 20	Price per lb. available phosphoric acid=cost per ton divided by no. lbs. in ton
Acid Phosphate	$32.50	16.	320.	10 cts.
Basic Slag, O.H.	22.00	6.	120.	18 1/3 cts.
Basic Slag War Brand	16.00	2.	40.	40 cts.

Source of Potash.

	Approx. makret price per ton	Percent of potash	Lbs. potash per ton=perecntage X 20	Price of potash per lb.=cost per ton divided by lbs. in ton
Muriate of Potash	$200.	50.	1000	20 cents

How to Value a Ready-Mixed Fertilizer

For example, a 2-8-2 fertilizer is offered for $61.25 per ton. The 2-8-2 means that the fertilizer contains 2 per cent of ammonia, 8 per cent of phosphoric acid and 2 per cent of potash. If we multiply the percentage by 20 (the number of hundred weight in a ton) we get the number of pounds of each element of fertility in a ton. Thus we find that this fertilizer would contain then 40 pounds of ammonia, 160 pounds of phosphoric acid and 40 pounds of potash. From our previous calculations we found we could buy ammonia for 31 1/3 cents per pound in Sulphate of Ammonia, phosphoric acid for 10 cents per pound in Acid Phosphate and potash for 2 cents per lb. in Muriate of Potash.

By applying these prices to our calculations we find:

	Percent.		Cwt. in ton.	Pounds in ton.		Price per pound.	Value in a ton.
Ammonia	2	X	20	= 40	X	31 1/3	= $12.53
Phosphoric acid	8	X	20	=160	X	10	= 16.00
Potash	2	X	20	= 40	X	20	= 8.00
							$36.53

This value $36.53 represents what a ton of this fertilizer could be bought for by buying the raw materials and mixing them at home.

To Fill a Fertilizer Perscription

Suppose you wish to prepare a 2-8-2 mixture, we want then 2% ammonia, 8% phosphoric acid and 2% potash. Now 2 per cent ammonia means 2 pounds per hundred. One ton contains 20 hunderd weight, so we multiply 2 by 20 and get 40 which is the number of pounds of ammonia required in a ton of the mixture. Sulphate of Ammonia contains as we saw from previous figures 24.5 per cent ammonia, or 24.5 pounds ammonia in 100 lbs. material. We want 40 pounds of ammonia so if there are 24.5 lbs. ammonia in 100 lbs. Sulphate of Ammonia, we would get 40 pounds in 100x40.x=163

24.5

pounds Sulphate of Ammonia. Using Acid Phosphate 16% available phosphoric acid and Muriate of Potash 50% potash, and proceeding in the above manner we would find as follows:

	Percent		Cwt. in ton	Total lbs. required in mixture	Pounds material required to furnish these amounts
Ammonia	2	X	20	= 40	163 Sulphate of Ammonia
Phosphoric acid	8	X	20	=160	1000 Acid Phosphate
Potash	2	X	20	= 40	¼ 80 Muriate of Potash
					12.43 total

or, as briefly put, the percentage composition required X 20 X 100 and divided by the percentage of plant food in the materials used gives the number of pounds of each material required.

In 1242 pounds of the above material we find as much plant food as is contained in a ton of the ready mixed 2-8-2 formula, hence such large applications are not necessary.

HORTICULTURE.

THE NEGLECTED ORCHARD

A few old decayed trees around the home fitly describes the orchard of today on far too many farms. A generation ago every farm home was an apple Eden. Apples were grown everywhere and by everybody. Now it is the exception to find an orchard that has been given the care usually given to other cultivated plants. Many orchards are worn out because they have been neglected, and many are in such a state that the trees are not worth pruning and waiting for results. Insects and fungi have been allowed free scope for reproduction and increase, and have contributed much to the downfall of the average farm orchard. Plant diseases and germs are continually increasing in kinds and in individuals. The kinds increase by importation from foreign countries and because as natural food is destroyed by the destruction of wild vegetation, pests are driven to the cultivated plants. The individuals of the innumerable kinds are increasing because farm orchard areas are becoming more and more the breeding ground for disease. Disease spreads faster and pests multiply as their feeding grounds extend and are left uncared for. The farmer with good intentions who spends time in pruning, spraying and cultivating is handicappel in his effort by his neighbor's pest propagating areas around his home.

The only attnetion many orchards have ever received is to have all the lower branches taken off. The argument put up in favor of this treatment is that "the good apples are always in the top of the tree anyawy." But those apples in the top of the tree had more sunlight and air, and as a result they were better than the apples that grew down in the more dense part away from the sun and in sheltered places where the bugs just love to work.

Few wornout orchards have been well pruned, a condition manifested almost at every farm. Trees with unsymmetrical heads, too many branches, decaying branches, and a growth of water sprouts fill the areas that get the name of orchard. Such orchards should be pruned to correct the defects mentioned; to let in light and air; to facilitate orchard operations, and increase the vigor of the trees. Have an ideal in mind as to the shape of the tree desired, and prune strong growing varieties lightly, and weak growing ones severely.

ESTAT JAMES KENNEDY,

KENSINGTON, P. E. I.

Every planting season you stake land, fertilizer, time, work, and the cost of the seed on the good faith of your Seedsmen.

Every season for Forty-five years **EWING'S SEEDS** have justified this good faith.

They are clean and fresh—they show a very high percentage of germination—and are true to name and type. They include all the best of the new varieties, as well as the old favorites.

Write early for our new Illustrated Catalogue, and if your dealer hasn't Ewing's Seeds, order from us direct.

The William Ewing Co., Limited

Seed Merchants, McGill St., Montreal. 65

Ewing's "Improved Hanson" Lettuce

A "crisp heading" variety that is very hardy and will stand extremes of weather. Head is large, hard, tender and crisp, with blanched centre; wholly free from bitterness, and remains long in excellent condition.

¼ lb. 90c; oz. 30c; pkt. 10c. Sent postage paid—cash with order.

Of all the places the farm home possesses the greatest opportunity for beautiful effects and profitable ornamentation is to be found in a well arranged and properly kept orchard. Judging by what is to be seen in many of the rural districts, this fact is not sufficiently appreciated. In many cases no attention is given to planting trees about the home, and as little attention to the trees that have been planned by a former generation.

Many times nature herself has given the country home and its surroundings al lthe main essentials of landscape beauty. With attention to some of the simple principles of oranemntal planting, or that necessary for keeping a well trimmed orchard, practically any farmer can make the grounds about his home a thing of beauty, thus not only making it a better place to live in, but enhancing the market value of his property.

USE OF ELEVEN AND SIX QUART FRUIT BASKETS

During the past few months there has been considerable difficulty in reaching an agreement as to the specifications of the new standard six and eleven quart veneer fruit baskets. This has meant an unavoidable delay in commencing their manufacture and has made it necessary to allow the use of baskets of the old sizes during the coming season. Manufacturers have therefore been advised that they may continue to make these until Septmber 1st next, after which date only baskets of the new dimensions, which have been finally agreed upon, may be manufactured.

So far as the use of the old baskets by growers and shippers is concerned, there are no restrictions. They may be used until the supply now in stock, or which may be manufactured up to September 1st next, is completely used up.

The necesity for arranging at an early date for a reasonable supply of fruit packages will be quite obvious to all fruit growers, as it will permit the manufacturer to meet the increased demand should the crop be above the average of the past few years. In past years, when the crop has been large difficulty has been experienced in obtaining sufficient packages to market it to advantage. This difficulty wil be removed if growers will place their orders well in advance of the harvesting season.

A circular letter has been sent to all fruit growers, dealers anad manufacturers on the mailing list of the Dominion Fruit Branch, embodying the foregoing information.

DISEASES IN HOT BED

Very frequently when plants are grown in the hotbed they are attacked by various diseases peculiar to the particular plant grown, sometimes resulting in the destruction of the whole bed. Various types of damping-off diseases and rots caused by either fungi or bacteria are common. The damping-off fungus is especially prevalent and also very destructive, often killing a whole bed of lettuce in three days.

Prevention is the best means of combat. First, insure that the disease is not in the soil by using new soil each year and thoroughly disinfecting the bed at the beginning of the season. During growth maintain as even a temperature as possible, avoiding high temperatures especially. To as great an extent as possible select hardy varieties of plants. When applying water, avoid wetting the leaves, if such is possible. At any rate do not have the plants thickly seeded so that when once wet they remain wet for several hours afterwards Keep a careful watch for disease and use the method of combat that best suits your own particular conditions and the plants being grown.

FIGHT CABBAGE WORMS NOW

Whenever the snow leaves the vegetable garden, gather up the old cabbage stumps that were left on the ground, the chances are that they are harboring cabbage worms in the dormant stage. To get rid of them, all that is necessary is to destroy the leaves, stems and everything that remains of the old cabbage in the garden. There is still time to rid the garden of many another pest by cleaning up and destroying the dead rubbish of last summer.

Never spray fruit trees when in bloom. The spraying is apt to wash off the pollen and when this occurs no fruit will set. The bees of the neighborhood may also be poisoned.

When using a solution of a strength that may damage foilage, try spraying but one or two plants at first. If no damage results after three days it may be safely applied on a larger scale.

The farmer by using his brains in winter can save his back next summer by scheming and plannngi the season's work.

RENOVATING THE NEGLECTED ORCHARD BY MODERN PRUNING YOUNG AND OLD APPLE TREES

Most fruit growers admit that pruning is essential in any orchard, but they do not always agree as to just which method of pruning is most desirable. This difference of opinion is not because all methods have not been sufficiently well tested, for all have undergone exhaustive tests. It is just because all growers do not have the same ideal tree before them when they think of what a perfect tree should be. In dealing with an orchard that has been neglected pruning will be guided largely by the trees as you find them.

The general idea is to have them so that the sunshine will reach every apple alike. The idea that the apples at the top of the tree are superior to others on the tree is due entirely to the fact that they get all the sunshine and the light, and if these trees were so thinned by pruning, all the apples on the tree would be of the same superior quality.

The Leader and Open Top Method

In some of the older sections the apple trees have and still are pruned chiefly to what we know as the "leader" system. Theoretically, a leader tree is one with a main stem running up in the air an indefinite distance and with several whorls of main branches arising from this main stem or "leader." But the open top pruning is the preferable way.

An open-top tree is in appearance just a big bush. The trunk is short and the main branches form a low head that is easy to spray and easy to harvest. It makes altogether the best type of orchard tree if you are intending to grow first-class fruit. The taller trees of the old style will produce more apples to the acre, but I doubt if they will produce as many dollars to the acre, and in this day and age it is money that talks.

Someone has said that the proper time to prune is "when your knife is sharp." That is largely correct provided you expect to use a knife to do the work; but even then it is possible to favor the tree by the selection of a favorable season.

According to experiments that have been conducted, it has been found that wounds heal just about as well if made at one season as if made at another. Many trees were pruned each month of a given year and all of the wounds seemed to heal equally well. If the same experiment had been conducted during some other year with a different set of climatic conditions, a difference might have been noticed.

If a tree is pruned early in winter and very severe weather follows, the pruned stub will nearly always be killed back for some distance. The reason for this is that moisture can more readily escape from the wounded surface than it can from a sound one. When too much moisture escapes from the tree death of the tissues occurs simply from the drying out process. In winter, with deeply frozen soil, it is often impossible for the tree to replace the moisture that is evaporated from the normal bark tissues. It is this drying out that produces the winter injury with which all growers are familiar. With a tree wounded from pruning this injury is very apt to be much worse. By delaying the pruning until late winter or very early spring, the wound is made just before growth starts. As a result the tissues round the cuts readily heal and the damage to the tree is quickly overcome.

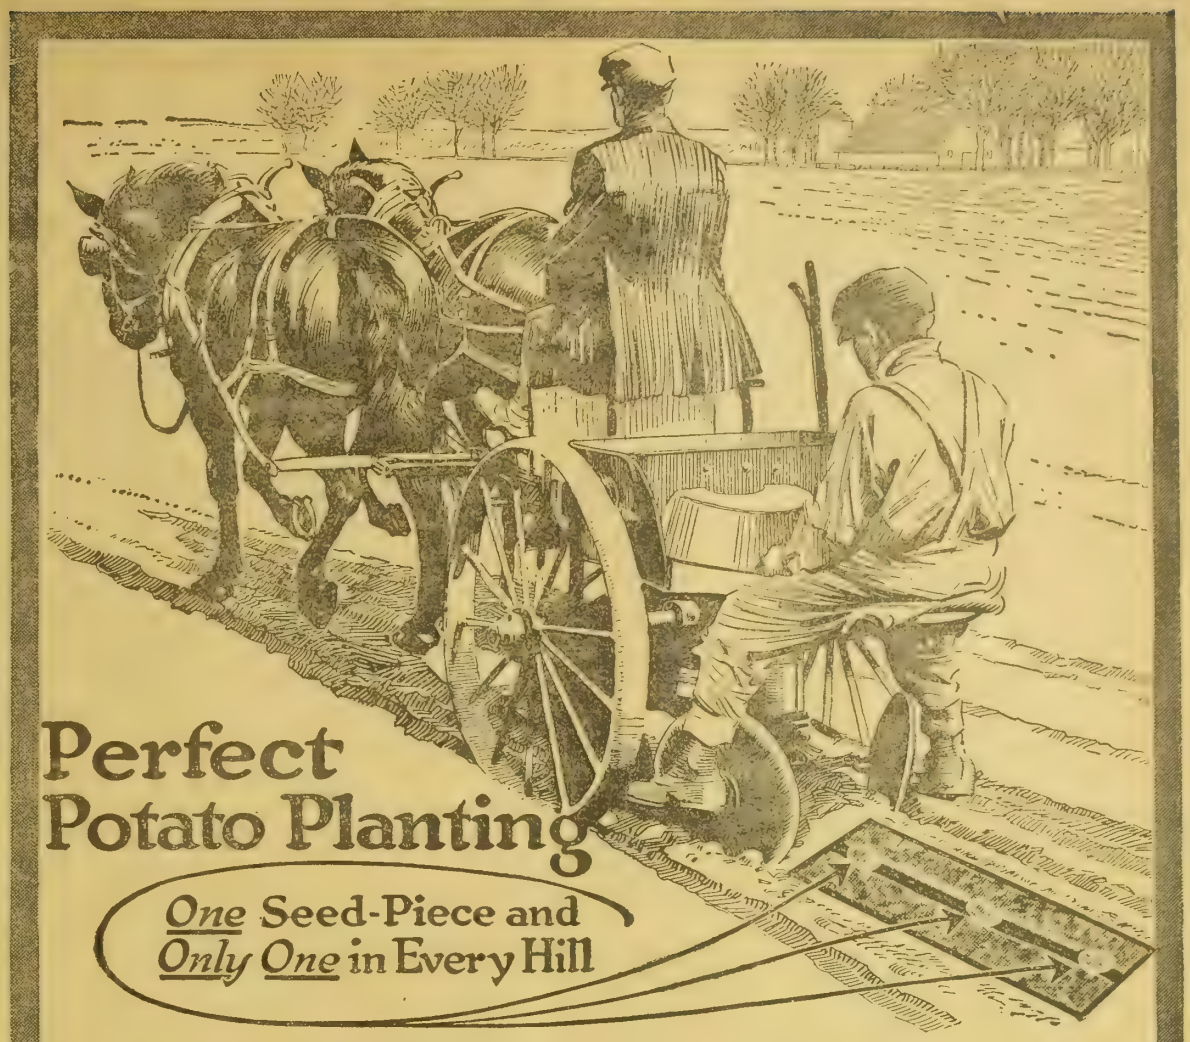
Stubs Must Be Removed

Regardles of the kind of tools you use to do your pruning, there are certain rules you must observe if you are to make a good job of your work. In cutting small branches always try to make the cut just above a bud. In this way the new growth will start close to the end of the branch you have cut off and no dead stub will be left to form a weak spot later.

In cutting large branches the cut must be made flush with the surface from which such branch originates. At the base of nearly all large limbs on an apple tree you will notice a very perceptible swelling. It was formerly thought that the proper place to cut was just where this swelling, or bulge, joints the branch. This, however, is not good practice. The branch must be taken off just as close to the tree as possible, regardless of any bulge and regardless of the size of the wound that results. A large wound flush with the tree will heal much quicker and give less future trouble than will a small wound at the end of the stub.

Short stubs or any other kind of stubs must never be allowed to remain on a tree. They can never heal over, and as a result they are a constant source of infection. Through them the spores of food-destroying fungi enter the tree.

There has been a good deal of discussion about the proper treatment of large pruning wounds. Some growers



Perfect Potato Planting

One Seed-Piece and Only One in Every Hill

Perfect Planting Pays the Profit! Cut out the "perfect" and you cut out the "profit." The first part of the crop goes to pay the cost of production; consequently, the profit depends on that *extra* part of the crop which perfect planting gives you. Perfect planting, together with stabilized prices due to the new dehydration plants and potato flour and starch mills, will enable you to calculate your profits with certainty.

Save Seed! The Iron Age is known as the 100 per cent planter because it puts *one* seed-piece and *only one* in every hill. This means a saving of $10 to $20 per day in seed alone. Loss through puncturing and bruising is entirely avoided.

Save Time and Labor! The perfect planting of the Iron Age means a tremendous saving of labor, time, fertilizer and insecticides, which would be wasted on missing hills. Unplanted spaces in your rows have to be worked over with plow, harrow, planter, cultivator, weeder, sprayer and digger, and require fertilizer and insecticides, the same as if planted. This loss *must* be avoided.

Uniform Spacing Makes Uniform Sizes! The "always-correct" spacing of the Iron Age Planter is necessary to obtain the largest percentage of No. 1's. Plants which are too close together produce undersize potatoes while those too far apart produce oversize potatoes.

There is *only* one planter that gives you this "personally-inspected" planting which saves your seed, your time, your labor, your fertilizer, your insecticides, and the *profit-part* of your crop—the *IRON AGE*—

The IRON AGE Line includes Potato Planters, Sprayers, Cultivators and Diggers; Garden Seeders and Wheel Hoes; Truckers' Variety Machines; Horse Hoes; Hay Rakes; Sulky Weeders; Climax Ensilage Cutters; Wilkinson Plows, Drag and Wheel Scrapers, Wheel Barrows; etc.

have advocated one sort of "dressing" and some another. Here again the experimental horticulturist has been of service in determining what is what. Skilled orchardists have made extensive experiments, and at the end hav been forced to conclude that the wounds which received no treatment healed just as well as those that were painted. Some kinds of paint caused actual injury.

It has never been demonstrated, however that a coating of good white-lead paint was injurious to a wound, and there is every reason to think that it may be of some benefit.

Though the unpainted wounds heal just as rapidly as those that are treated the character of the tissues which are healed is not the same. If a large wound is left untreated the bark at the edges will in time entirely cover it, and it may appear to be in perfect condition. However, the exposed wood is certain to check and crack, and before the bark has entirely sealed up the opening, some decay may have started in the heartwood. Later, under the perfect scar, this decay will work down into the trunk and some day the orchardist will be surpirsed to find that an unsuspected hollow tree has blown over in the night.

On the other hand, the wood of large wounds is painted it is much less likely to crack, thus preventing decay from setting in. Cover every large wound that is made, and use grafting wav rather than paint of any kind. In the first place, it it not always possible to know just what chemicals are in the lead paint you buy, but you do know what is in the grafting wax because you will make it yourself. Then, too, the wax will remain on the tree indefinitely and will keep out the air and water perfectly until such time as the bark has grown entirely over the scar.

Very large scars will heal rapidly at first and then, as the new bark becomes tougher, the healing is less rapid. If at the beginning of a growing season this newly formed bark is cut slightly with a sharp, clean knife, it will again begin to grow vigorously and the complete healing of the scar can thus be materialy hastened.

Pruning Old Neglected Trees

Old trees which have been badly neglected for a long time often present many difficult problems to the pruner. In the first place, these old trees were often badly started and their early owners usualy spoke of their tree trimming as "pruning up the trees." That just describes it. They were "pruned up" until all of the lower branches were removed and the fruit-bearing area was finally high above the earth.

It is sometimes impossible to do much with such old trees. Severe heading back will often expose large areas of old bark that has been growing in the shade for years. The sudden exposure to the sun will result in sun scald, the bark will die, borers will enter, and in a short time the old tree is gone.

It is usually much better to thin out the tops so as to allow air and a moderate amount of sunshine to reach the fruit, and to remove all deadwood. Often each old tree is a problem in itself, and to attempt to describe the proper pruning of enough types to cover the ground would take more space than this entire article.

After any mature tree has had a moderately severe pruning there will be a tendency for it to produce a quantity of "water sprouts." These are simply vigorous shoots that originate along the trunk and on the main branches. Some varieties produce them early in life in great abundance. In all cases they are to be removed, except where a tree has been damaged and a water sprout may be useful in growing a new branch.

Training the Young Tree

It is quite possible that many of the trees will be beyond the stage that skilled pruning can court back to fruit-bearing, and in that case the only alternative will be planting young trees.

The pruning of an apple tree starts immediately after it is planted. In fact, it may be started even before it is planted, and as far as the roots are concerned it must be. tI is somewhat more convenient to plant the tree just as it comes from the nursery and then as soon as it is firmly fixed in the ground it should be pruned.

If a one-year old tree has been planted the pruning will be a simple matter because such trees usually consist of a single straight "whip." This whip is merely headed back to a single bud about 30 inches above the ground. This 30 inches will form the trunk of the future orchard tree and it should not be encouraged to grow any taller. It is understood, of course' that stems—of the sort of plants we are discusing—do not grow in length after the first year. Consequently, if the head of our tree is formed close to the ground it will remain forever so. Later the lower branches may be removed(but the trunk of the tree will never elongate, because it is physically impossible.

In planting a two-year-old apple tree you will find that the nursery has furnished a much-branched little thing that looks like a dwarfed orchard tree. There are nearly always more branches than there should be and they are always quite long for their age. These branches must be shortened to about one-third of their length and their number must be reduced to not more than five. Three branches left on a tree of this age are often enough, but five are more nearly an ideal numer.

These five branches will form the one-year-old tree will be very similar to that described for the initial pruning of the two-year-old from the nursery. After that you can usually simplify matters by preventing all formation of any more main branches and by treating each branch just as if it wtre in itself a small tree.

These newly painted trees grow vigorously for the first few years and it

"TOTAL ARSENIC AS METALLIC ARSENIC, NOT LESS THAN 32.5%. ALL OF WHICH IS IN SOLUBLE FORM.
DISTRIBUTED BY
JOHN WATSON & COMPANY
HOULTON, MAINE
CAUTION

One pound does the work of two of Paris Green, and does it better. It's first cost is far less than Paris Green. WATSON'S SOLUBLE ARSENOID is now recognized to be far the most efficient insecticide for killing potato bugs and other leaf eating insects.

It must be used with bordeaux mixture, and not otherwise. It is very adhesive and does not wash off easily.

FREE OF DUTY except the war tax.

On July 22, 1918, the Canadian Customs at Ottawa issued an order removing the duty on WATSON'S SOLUBLE ARSENOID except the war tax, and this order applies only to WATSON'S SOLUBLE ARSENOID, manufactured by John Watson and Company, Houlton, Maine. This endorsement speaks for itself.

WATSON'S SOLUBLE ARSENOID has been on the market for a number of years and is used almost exclusively in Aroostook County. If your dealer cannot supply you, write us direct, and give us the name of your dealer.

JOHN WATSON AND COMPANY,
HOULTON, MAINE, U. S. A.

Top Dress with Nitrate of Soda

Feed the Crop; not the Bacteria

Every form of Nitrogen fertilizer, except Nitrate of Soda, must be broken down by bacteria and changed into Nitrate before it can become available for crops. Such bacterial action always results in costly *Nitrogen* losses.

Nitrate of Soda

is *already nitrated!* It does not have to undergo changes—but is immediately and wholly available. That's why Nitrate is the quickest, surest, most economical source of Nitrogen

Grow Strawberries for Profit

Do you know that one Farmer in New Brunswick sold nearly $5000 worth of berries from five Acres? That another Farmer sold over $8000 worth from a little over ten acres? These results are not exceptional, any good farmer can do as well who will give his attention to the most profitable crop that can be grown in the Maritime Provinces. We can supply Plants for the professional Strawberry Grower, for the man who grows an acre or two as a side line to general farming or for the family garden. Good strong well rooted plants are more than half the battle in successful strawberry culture. Start right. Don't take plants from an old bed or from the side of the rows as a gift. All Farmers know that poor seed means a poor crop. Dunlaps, Warfields and Beder Woods, $4.00 a thousand; Sample, Glen Mary and Dr. Burrell, five dollars a thousand.

Catalogue Free.

CYRUS & MANNING ELLS,
PORT WILLIAMS, N. S.

is at this period of their growth that you must be watchful to see that the tree is properly shaped for if neglected now it will take a great deal of engineering to correct the error after the tree grows to a large size. There are some orchards over thirty years old in which the trees have not been pruned for at least fifteen or twenty years, but in spite of that they are well-shaped trees and really need comparatively little pruning now. Comparatively little later pruning was needed, owing to the fact that they had been carefully grown and pruned during the first ten years of their life.

After a tree gets to be six or eight years old—and in some cases at an earlier age than this—the need for severe pruning ceases. At this age the tree should begin to bear a little fruit, and it is reaching a size where it can hold quite a good load if it has the chance. Constant pruning does not improve this chance. In these older trees the chief pruning that is needed is to remove an occasional cross branch, to thin out branches that have grown too thick with twigs, and to cut out carefully all dead, diseased or otherwise damaged wood.—B. W. Douglas.

SOIL MANAGEMENT INVESTIGATIONS IN A YOUNG APPLE ORCHARD

The object of this investigation carried on at Laurel, Indiana, has been to study the effects, and particularly the factors responsible for the effects of tillage with cover crop, mulch, and sod on apple trees. The present report covers the formative period of the life of the trees. The land comprising the experimental plots had been user as premanent pasture for nearly 40 years previous to planting the orchard. The investigation has to do mainly with the upland area, the hillside plot being included for any additional light it might throw on the behaviour of th eupland plots. The systems of soil management include four major treatments, viz., clean cultivation with a winter cover crop; a heavy mulch of straw applied to the trees, and the grass cut and let lie; the grass cut and alolwed to lie where it falls, no mulch given the trees; the grass cut and raked up to form a mulch collar about the trees.

The Laurel soil contains a high percentage of silt and clay, and varies but little in its physical composition, specific gravity and water-holding capacity. The soil (to a depth of 9 in.) is not notably deficient in any essential element, however it is not very productive. The low organic matter content and the high proportions of silt and clay, make the soil one through which water percolates slowly and one which is easily puddled; coupled with these conditions is a slight acidity. The subsoil is not greatly different from the surface soil.

The average annual precipitation during the five year-period, 1912-1916, has been 38.71 in. The spring months are usually much better supplied with moisture than the autumn months. Periods of dry weather frequently prevail in June and July, which are commonly broken by heavy precipitation in August.

While there have been no wide variations in phenological behaviour of trees under different systems of soil management, yet there does not occur a marked slacking up of growth on grass plots during dry periods in summer.

Trees grown under a clean culture cover crop system or under a heavy mulch made 44.5 per cent. greater average yearly gains in trunk girth than trees grown as grass with a light mulch or no mulch at all. There was no significant difference between the three varieties, Grimes, Jonathan and Stayman, in their response to soil management treatments. The Stayman variety made slightly greater gain in girth of trunk on all plots than did the Grimes or Jonathan.

It is largely in dry periods that the value of certain systems of management in conserving soil moisture are made manifest. During two such periods, occurring in June two out the five years, where an adequate mulch was maintained on the surface of the ground, either through the agency of cultivation or a heavy supplemental covering, the percentage of soil moisture was more than twice that in grass land. These soil moisture conditions are closely correlated with the girth increase made by the trees. The great importance of water in tree growth is further emphasized by a study of the precipitation data which show that the variation in growth due to seasonal moisture conditions, appears to have been quite as lagre as that due to cultural practices.

The soil temperature studies were carried out under field conditions (at a uniform depth of 9 in. on all plots)

DAIRYING.

DEVELOPING THE HEIFER TO DO HER BEST WHEN SHE BECOMES A WORKING COW

The profitableness of dairying depends to a large extent upon the careful rearing of the heifer calves from the best cows, and sired by a good purebred bull of quality The care and feeding of the calf during the first few months of its life is often the deciding factor as to whether that calf is going to develop into a satisfactory cow or not. The ill-fed calf seldom develops into a satisfactory animal, and no matter how skilfully she is cared for as a heifer, she cannot be developed into a high class mature animal.

On the other hand it often happens that the well-fed heifer calf does not develop into a good cow, simply because she was not developed as a heifer. It pays to feed the growing heifer well and develop her as she should be. Any extra amount of feed given her wil lbe repaid when she becomes a cow. Here is where a great many of our dairymn fall down, they practically let the heifer shift for herself as much as possible and consequently she does attain the size or development she should. One of the main reasons why the dairymen of Scotland are so successful is that they lay great emphasis upon the feeding of their heifers and consequently they grow into profitable dairy cows.

Feeding the Calf

The calf should have its mother's milk for the first three or four days. The fresh milk of the newly calved cow contains what is necessary to stimulate the newly born calf's digestive system into action. At least the calf should have fresh milk till two weeks old, five to six quarts a day being sufficient. After that time, skim milk may be substituted gradually, till finally the whole milk is dropped entirely. As the whole milk is decreased some substitute should be added to the skim milk to supply the fat which is lacking in that article. One part ground flax seed, two parts fine sifted cornmeal, two parts finely ground oatmeal, make a very satisfactory mixture when fed in addition to skim milk.

At three weeks or so the calf will commence to nibble at a little hay, and some nice clover hay should be within reach of it at all times. It is not wise to pasture calves until they are at least six months of age, and then only on good pasture with plenty of shelter. The calf requires more concentrated feed than grass supplies, and consequently young calves do not do as well on pasture as when stabled and well fed.

Developing the Heifer

In spring all calves over seven months old can be turned out to grass and if the pasture is good that is all the feed they require till fall. They should have plenty shade, water and salt twice a week. When brought into the stable the food should be plentiful. Silage, roots, clover hay and good quality straw, together with a little meal, will keep them growing steadily throughout the winter. There is nothing better than silage and turnips to put growth on a young animal and it wil pay to feed such feeds to the growing heifers.

It is not good practice to breed a dairy heifer until she is at least twenty months old, but this will depend largely upon the development of the heifer, and to some extent upon the breed. At any rate she should not be bred before she is properly developed. During the period she is carrying her first calf she should be handled occasionally, so that she may cause as little trouble as possible when first commencing to milk. Great care is also necessary just before the heifer freshens so as to prevent any udder trouble, etc., so often caused by feeding to heavily on strong meals.

"BULLS IS BULLS"

Thousands of dairy farmers have deluded themselves by using scrub bulls. Result—low producing, low testing, ill shaped, unprofitable cows.

Do you realize that a good bull is more than half the herd, but a scrub is mighty near all of it?

In this age of high prices—

Economy and Efficiency

is the watchword of every manufacturer.

Mr. Dairyman: Do they apply to you?

If so, remember that no breed has ever proved their superiority to the *Ayrshire* in these two great essentials. *Start right*—put an *Ayrshire Bull* at the head of your *herd* and grade it up.

For information about the *Ayrshire* breed, write:—

W. F. STEPHEN,
Secretary

Canadian Ayrshire Breeders' Ass'n
HUNTINGDON, QUE.

10

LANDS WANTED FOR... SOLDIER SETTLERS

POWERS have been granted to the Soldier Settlement Board of Canada by Order in Council of the 11th of February, 1919, to purchase land to be re-sold to qualified returned soldiers who desire to make farming their permanent vocation.

To assist soldiers in settling in any suitable district in which they may wish to locate, the Soldier Settlement Board desires to have filed in each of their Provincial Offices a select list of farm lands available for purchase in each district of the Eastern Provinces, with full description and lowest cash prices of the same. Purchases by the Board will be paid for in cash.

The public are informed that this land is for purchase by returned soldiers, and must be of good agricultural quality, and reasonable price, making possible the success of the soldier as a farmer. It should be within seven miles of a railway, open, free from weeds, water supply assured, and of moderate price. In giving particulars, mention nearest market and school. In comparison with the vast supply of vacant lands, the number of farms immediately required will be very limited. Owners, therefore, will kindly assist the Board by offering for the present only land which fills the above requirements.

No commission will be charged or paid. No offers to sell will be binding on the person offering, unless a sale is effected, and no obligation will be on the Board to accept any offer.

If application from a returned soldier be received for the purchase of land, an inspection and valuation of such land may be made by the Board, as soon as free from snow. If approved, negotiations may be entered into for the purchase and sale thereof. An approved list is desired for each suitable district throughout Canada

All communications concerning land in the Eastern Provinces should be addressed to the Provincial Supervisor of the Soldier Settlement Board for the province in which the land offered for sale is situated, a list of whom is given below:—

ONTARIO:
Mr. W. M. Jones, 32 Adelaide St. E., Toronto.

QUEBEC:
Lt.-Col. Bruce F. Campbell, Drummond Bldg., Montreal.

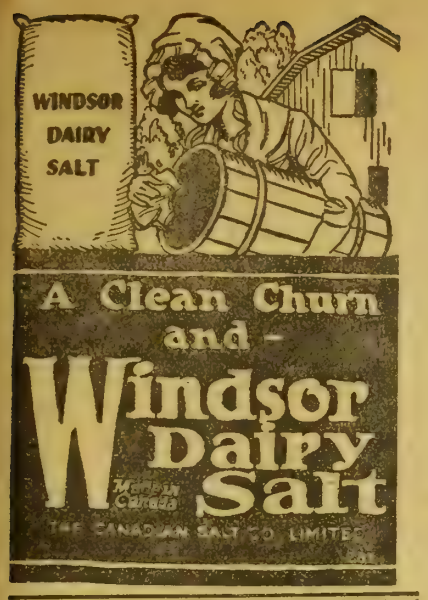
NEW BRUNSWICK:
Mr. Wm. Kerr, Post Office Bldg., St. John.

NOVA SCOTIA:
Mr. R. H. Congdon, 529 Barrington St., Halifax.

PRINCE EDWARD ISLAND:
Soldier Settlement Board, Riley Bldg., Charlottetown.

SOLDIER SETTLEMENT BOARD, Canada.

Advertise in the Maritime Farmer



Bran is the best concentrate to give the heifer at this time and it is also wise to reduce the allowance of silago, especially if there is any amount of grain in it. It is also good practice to milk the heifer as long a period as possible the first year, as this tends to fix the length of her lactation periods in future years. The heifer that is allowed to go dry at nine months the first year is very likely to do the same the following year, and so on throughout her years of work as a dairy cow.

THE CARE OF THE MILKING MACHINE

(Experimental Farms Note)

In the production of pure milk with milking machine, great care is necessary in the handling and washing of the machine. Milk that is allowed to become dry on the parts is very difficult to get off. To avoid this, as soon as the cows are milked and the milk empitied, but while the pump is still running, cold water should be drawn through the teat cups into the can. The machines should then be removed to the dairy and dismantled. The can covers to which the pusator is usually attached should be washed, wiped dry and hung up. The teat cups and tubes should be washed in hot water to which has been added some alkaline washing powder. This will dissolve any fats adhering to the parts. Once a day, a brush should be used on the interior of the teat cups. These parts should now be put into a sterilized solution until next milking time. Once a week the teat cups and attached rubbers should be taken apart and thoroughly washed in hot alkaline water with the special brushes suplied for this purpose. The cans may be handled with the rest of the dairy utensils in the ordinary way, steaming or scalding and draining in a room free from dust being important.

On taking the teat cups from the sterilizing solution for the next milking, they should be rinsed in fresh, cold water and then be assembled. At this stage, the drawing of scalding water through the teat cups into the cans would have a beneficial effect but is liable to injure the rubber. When adjusting the milker and attaching the teat cups to the cow's teats, be careful not to draw barn air through the tubes into the can. In shifting the machine from one cow to another and changing the cans let the milk and cans be exposed to the barn ais as little as possible.

One of the best sterilizing solutions to use is composed of chloride of lime. Use fresh chloride of lime, preferably from sealed tins and provide an earthenware crock. Into this put one pound of chloride of lime and add a gallon of cold water. Break up the lumps, stir thoroughly and then allow to settle. Cover and keep in a cool place. This is a stock solution and only the clear liquid off the top is to be used. In making up the solution ofr the teat cups use one pint of this stock solution to every ten gallons of water. As the sterilizing action gradually decreases, add another half-pint of the stock solution every three or four days as long as this solution is kept in use. The old solution should be emptied out and a new solution made as often as is necessary to keep it clean. A new stock solution should be made at least every two weeks.

The keeping of the outside metal parts of the teat cups and pails bright is not so important but improves the appearance of the machines. For this purpose such polishing substances as Bon Ami, Dutch Cleanser, etc., may be used.

TESTS IN FEEDING BREEDING FEMALES

Proper feeding has much to do with assuring the full gestation period, and a normal birth of healthy, vigorous offspring. The use of good roughages, such as alfalfa and clover hay, solves the problem except where trouble is caused by contagion. These facts have been fully proved by a series of experiments covering the past ten years at the Wisconsin Experimental Station, where cows were fed a variety of balanced rations from calfhood to maturity and on through several gestation periods The first principal they discovered is that a balance between protein and energy in the feed is not sufficient Abundant mineral matter is necessary. Some feeds contain unknown injurious substances, whose evil effects are only counterbalanced by a suitable variety in the ration.

Even with good roughage it was found that wheat or its by-products should not be fed continuously too liberally, or the offspring would be weak. Injurious effects were produced especially by feeding the embryo of the wheat kernel. Poor roughages to cause early delivery of offspring and failure of the cow properly to clean, with the consequent liability to starting infection. The low mineral content seemed to be the cause of injury from feeding too exclusively on straw for roughage. The experiments significantly comment that "the condition of the straw-stack herd, without reference to what the calves may be, is direct evidence of poor nutrition." Cows fed entirely on wheat products and straw, or on oat products and straw, always produced either weak or dead calves or abortions. Those fed on these rations with half of the straw replaced by alfalfa hay produced strong calves.

Dairymen especially should apply these teachings. While it is well known that contagious abortion is common in dairy districts, it is important for breeders to recognize the fact that it is possible to produce dead or weak premature calves from the improper selection of feeds. Contagion is doubtless blamed for much damage which it does not cause. Heavy milking cows frequently secrete more mineral matter in their milk than is supplide by their feed. The evils of poor nutrition are added to those of contagion and the disaster is increased. On the other hand, sufficient minearl nutrition may be expected to check the damage done by infction. This phase of the problem is not covered by the Wisconsin tests, but logically presents itself for thoughtful consideration, because it is known that some cows naturally possess, and others acquire, a degree of immunity to infection. Proper feeding may help.—E. T. R.

THE
DE LAVAL
CREAM SEPARATOR
Every Reflection Shows Perfection

VIEWED from every angle, the De Laval is distinctly in a class by itself. It has a business-like appearance. It looks as if it were well made, and it is. It looks sturdy, and it is. There is no make-believe about it anywhere, from the wide-spreading substantial base to the solid, seamless, symmetrical supply can.

It's no wonder that big dairymen and creamerymen who have for years made a careful study of dairy methods and machinery refuse to consider any other separator but the De Laval. They know that from every angle—clean skimming, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

They know that it has a record of 40 years of service behind it. They know that it can be depended upon. They know that they can't afford to take chances with any other cream separator—

And neither can you.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

THE DE LAVAL COMPANY, Limited

ADVANTAGES OF DIPPING

It is important, in order to gain success in sheep husbandry, to be assured that the sheep are in a healthy condition when brought into winter quarters. Under close housing conditions infection runs rife and parasites increase at an alarming rate. This is especially true of mite, causing sheep scab, the louse and the sheep tick. The wool, being long in the winter, the tick is protected and, consequently, receives greater opportunity for rapid growth and for reproduction of hordes of its own kind. Its ravages, however, can always be lessened and, to a large extent, entirely prevented by fall dipping.

If any sheep ni the flock should appear to be infected with scab, that sheep should, without delay, be isolated from the healthy ones. The wool should be clipped from that portion of the body directly affected with the disease, so as to permit the dip coming in full contact with the scabby skin. The sheep should at once be dipped in some reliable material twice at least, and three times still better, at intervals of ten days. A longer period may elapse between the second anad third dippings. The stringent, precauationary measures of quarantine and compulsor dipping of infected cases adopted and pursued by the Dominion Department of Agriculture, has, however, happily kept in subjection the most dread disease.

It should be explained that sheep scab is a contagious disease governed by the Animal Contagious Diseases' Act and that the owner of a flock in which an outbreak has been discovered is bound to report the fact to the department. Failure to make such report involves the penalty of a fine of not more than $200.

Necessity of Dipping

With the average flockmaster, dipping is directed specifically against the sheep tick. Dipping for this purpose should be practiced twice a year, in the spring after the sheep are shorn and in the fall as they are taken from pasture. Most shepherds realize the necessity of dipping in the spring when the ticks are plainly visible on the shorn sheep. In the fall the ticks are deeply hidden in the recesses of the wool, and to the careless sheep raiser are not apparent. He rests under the delusion that the one dipping has destroyed all of these external parasites or that there are not sufficient left to compel a second dipping. This is a mistake that, it must be regretted, with the average farmer is far too usual. It is really more important to dip in the fall than in the spring, since in the spring, if the sheep are shorn early, cold weather will very frequently destroy the unprotected ticks. At that time of year it is more essential to dip the lambs, since the ticks will leave the shorn bodies of the ewes and take up their abode in the longer wool of the lambs where they can obtain some shelter against the cold. Besides, if sheep are severely infested with ticks during the winter they lose flesh and become debiliated more rapidly than during the summer, when both feed and weather conditions are of a more propitious nature to aid the upbiulding or recuperation of their vitality.

Classes of Dips

Diips can be classified according to the nature of the poison they contain, as carbolic, arsenic and tobacco. Most standard proprietary dips will produce effective results, providing the directions of the manufacturers are carefully followed. No material, however, should be purchased without a thorough investigation of its merits. The farmer who raises a small number of sheep may club together with others so as to permit purchase in large quantities, which will not only reduce the cost but assure a good quality of dip.

For a small flock of sheep it will not be necessary to construct an elaborate dipping apparatus. A tub or trough, large enough to hold a sheep will answer the purpose. There should also be a small pen connected with the dipping trough and with a floor sloping toward the latter, wherein the sheep may be perimtted to drain. The wool especially if long, will soak up a large quantity of dip, a part of which can be saved by keeping the sheep in a draining pen for several minutes.

Description of Tank

Modern steel tanks may be purchased on the market at a reasonable cost. One can readily be made by a tinsmith from galvanized iron, or a wooden frame can be constructed and lined with a thin layer of this material. Concrete vats are also coming into comon use. For the average sheep raiser quite satisfactory results be obtained from a tank made entirely from inch and a half pine plank, smoothly planed and firmly bolted together. The joints should be well covered with pitch to prevent leaking.

A tank conforming with the following measurements, will prove suitable for a flock of 50 to 500 head: 10 feet long at the top, 3½ feet at the bottom, 2 feet wide and 4 feet deep. The sides and one end are perpendicular, the other end having a slope in the neighborhood of 35 degrees. On the entire inner surface of the sloping end are fastened cleats 8 inches apart. These form a stairway by means of which the sheep with little or no aid, can climb from the vat. The tank is placed in the ground so that the upper edge rests only a foot or so above the surface.

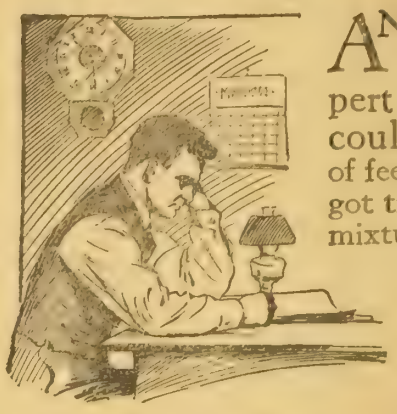
Draining Pens

The dripping pen is connected with the tank at its sloping end. The sides of this pen may be made of heavy 1 by 4 inch slats with a matched plank floor. The floor should decline gradually toward the vat, so as to permit the return of the dipping fluid. It should also be cleated, but openings, to provide for small narrow drains, must be left on both sides. The draining pen may be very long and the same width throughout as the vat, or it is commonoly made triangular shaped, the same width as the tank where it joins the latter, 5 feet at the other end, 10 feet long. In large flocks it is sometimes an advantage to have two dripping enclosures, one following the other. By so doing more fluid can be saved.

Unless the tank can be conveniently placed in close proximity to the gate of a sma'l yard, a pen 8 to 15 feet long and the same width as the vat, should join the vertical end of the latter. In structure it resembles the draining pen except that a sloping floor is not necessary. The floor should be on a level with the topmost edge of the vat. From this pen the sheep can be plunged into the dipping fluid. A cleated floor here is also an advantage, and a sloping runway at the entrance.

Dipping should be performed, if possible, on a bright, sunny day, so that the sheep may have an opportunity to dry off perfectly. They should remain in ithe dip at least two minutes. Several minutes must be allowed for draining. The fluid should be heated to about 110 degrees Fahr. Guard, however, against having it so warm as to give the animals a sudden chill when they return to the cold air.—By T. Reg. Arkell.

Let Experts Figure the Rations



Don't Waste Your Time

ANYBODY can feed a hog—but only experts can feed for *tip-top results*. Who but an expert with years of study and special experience could properly make available the odds and ends of feed materials about your farm. Certainly you haven't got time either to study scientific feeding or to figure out mixtures changing with the feed materials that happen to be available to you.

Let the experts figure your rations.

Our experts—Canadian experts with closest knowledge of Canadian needs—have the time, the scientific training and the facilities for proper selection and mixing of feeds. The result is

Monarch Hog Feed

the cheapest feed available because it means good, firm, hard bacon, commanding best prices. It means quality bacon at minimum cost of production when feeds are high-priced. In short, it means extra profits put into your pocket.

Monarch Hog Feed is not only calculated to a nicety as a ration, but it is properly mixed. And it is handy. No trouble collecting feeds to mix—just one feed to handle. You just ought to see how hogs go for it. It is both highly palatable and digestible.

Monarch Hog Feed is composed of shorts, corn products and digester tankage. It is unequalled for bone and muscle forming, and supplies the right amount of fat for shortening the hogs' stay on the farm and for sending them to market in A1 condition. Guaranteed analysis: protein 15%, fat 4%

Decidedly you should feed not only for results but for MAXIMUM profits. With Monarch you can do it. Give it a trial. Order a ton from your dealer. If he can't supply Monarch write us direct, giving dealer's name.

MONARCH DAIRY FEED

has guaranteed analysis of 20% protein and 4% fat. It is a properly mixed combination of Oil Cake Meal and Cotton-seed meal with the bulky feeds, bran and corn meal. Though very rich, ensuring splendid results, it can be fed alone.

SAMPSON FEED

This general purposes feed is somewhat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage; it gives results for both cattle and hogs. Guaranteed analysis: 10% protein and 4% fat.

INFLUENCE OF THE AGE OF THE COW ON THE COMPOSITION AND PROPERTIES OF MILK AND MILK FAT

The question of the changes in the composition of milk with successive lactation periods and particularly the question of relation to the percentage of fat in the milk of the heifer has been of great practical importance to th edairyman, as a possible index of what may be expected from the mature animals. The conclusions so far reached from data compiled by several investigators have not been entirely uniform. This paper offers new data on the question, taken from the records of the University of Missouri dair yherd, composed of purebred animals of the Jersey, Holstein, Ayrshire anad Shorthorn breeds.

The data showing the average percentage of fat for the successive lactation periods of all animals of each breed and similar data for the entire herd are given in tables in the Institute Buletin.

These data show that the percentage of fat in the milk of Jersey cows attains its maximum with respect to the average for the entire lactation ptriod during any one of the first three periods, but the chances appear to be greater that this will be attained in the second or thir period rather than the first.

Holstein cows on the contrary almost invariably show the highest average of fat for the lactation period during the first period and the conclusion seems justified that this is a breed characteristic.

Ayshire cows more frequently show a higher average lactation test during the first than during subsequent periods, but less frequently than in the case of Holstein cows.

The variations in the average percentage of fat among the first few lactation periods are not sufficiently great to be of much practical importance but the gradual decline in average test accumulates to a figure of considerable importance as the number of lactation periods becomes greater.

The fact that certain of the animals of the Jersey and Holstein breeds whose records are included in the data, comprised an experiment to determine the influences of the plane of nutrition during growth and age of first calving upon the dairy qualities of cows, suggested that the two factors may have contributed to the dif ference in the character of the data from the two breeds.

The data concerning the influence of the plane of nutrition during the growth, indicate that this factor may be of importance in connection with the average fat test for the first lactation period. The light-fed Jerseys showed both a lower average test in the first latcation period and also a less frequent tendency for this period to show the highest test, while the heavy fed Jerseys sowed exactly opposite results. The strong breed tendency for the Holsteins to show a higher average test in the first lactation period than in any subsequent period was also materialy diminished by light feeding during the growth of the animals.

It must also be considered that the light feeding of the animals for both breeds was by no means extreme, although it was widely different from the heavy feeding carried out with the other animals in the experiment.

The data bearing on the age of first parturition indicate that a difference of 16 months between the first parturition of the Jerseys had little influence upon the breed tendency already noted for the higher test to accompany the second lactation period. In the case of the Holsteins, however, calving at a more advanced age seemed to decrease the breed tendncy for th first lactation period to show the higher average test. As far as the composition and properties of milk of aged cows is concerned neither the percentage composition of the milk nor the physical and chemical constants of the milk fat of aged cows show any abnormalities attributable to old age.

Butter made from the milk of a cow 19 years old and in her thirteenth lactation period was pronounced to be of excellent quality and kept for a period of three months at a temperature of 8° to 10° C, (46° to 50° F.) without showing any marked deterioration.—C. H. Eckles and L. S. Palmer in the Journal of Agricultural Research.

Shorthorns

The Breed For You

Shorthorn steers hold the high-price record for a carload on the open market in Canada. They also hold the high-price record for carlots of heavy steers, yearlings and feeders on the American open markets. They are money makers.

LESS DAIRY DRUDGERY

Nearly every dariyman who has used a milking machine for six months or more and knows how to handle it properly declares that there is nothing like it. If he had to go back to the old method of milking by hand he would go out of business at once. With two good machines one man can milk at least 20 cows in half an hour, which means that at least an hour and a half's time is saved. It is such laborr-saving appliances as the milking machine that keeps our boys on the farm. It is drudgery which sends boys to the city, and to most boys mliking cows after coming in from the fields is the worst kind of drudgery. The milking machine is one of the forces which are making the farm a better place to live and the farmer's life more pleasant.

The Savings Bank Pays 4%

A savings bank account is a splendid thing, but if you own cows and have no silo you will find that a few dollars invested in a good silo will bring you very much greater returns than the same amount put into the bank. The average savings bank pays 3½ or 4%

An IDEAL GREEN FEED SILO will pay 100%

A prominent dairy authority says that a silo is worth its entire cost if it is used for only one year. The life of an IDEAL SILO is from twenty to thirty years. Is it any wonder farmers are finding the Silo profitable?

Practically one-third of the feeding value of your corn crop is lost when fodder is allowed to dry. An IDEAL will not only save all the nutritive elements of the fresh, green corn, but will convert into rich, juicy, milk-producing feed corn stalks that cattle can not otherwise eat up clean. It reduces feed bills; means more milk, healthier cattle and less labor in feeding.

Write today for a catalogue. It shows you every detail of the IDEAL and explains just why you get in it more for your money than in any other silo.

Keep the cows in clover all the winter long

COWOLOGY

Rub-a-dub-dubs,
Three men all with scrubs,,
They flounder and flatter and feed,
'Till they're blue in the face,
And worn out with the race,
Then ask if there's value in breed.

The first thought he knew
Of only a few
Of dairymen who had made kale;
So he sold all his cows
But now he allows
That his is a slim dinner pail.

The second made a raid,
From scrub turned to grade
And now 'stead of bills has some debtors,
His friends thought it well—
His decision to sell
The cows that had kept him in fetters.

The third took the lead,
Sold out; ;bought a breed
And now he makes money galore.
He sells cheese and calves,
Then the proceeds he halves,
The right buys a bull to make more.

Left half hits the road
To lighten the load
Of the wife who has helped save the mon.
And the girls and the boys,
Have a life full of joys.
Sure! Life in the city they'll shun.

So if you've a scrub,
Don't be a dense dub
And conclude that there's nothing in cows,
Clean house; take the lead
Buckle up; name the breed
And your home will rest high in the boughs.

I. J. MATTHEWS.

The best practice in removing horns is to use caustic potash on the young calves, apply it before the horns are enough developed that they break through the skin. This operations is a simple one and is very much to be preferred to waiting until the horns are developed and then having them taken off with a saw or clipper.

THE HORSE

METHODS OF TONING UP "OUT OF CONDITION" YOUNG COLT AND WORKING HORSE

Had horses suffered from as many diseases while in the natural state as they do in the domesticated surroundings on the farm, they would, as a species, long ere now have ceased to exist. It is a well-known fact to all who take intelligent interest in the domesticated life of the horse that most of the diseases that follow the life of the farm horse are due to this domestication. Those who are most successful in horse raising are those who consider these changed conditions from that of nature, and substitute for them artificial methods of attention that bring health and vigor to the animals. The whole secret of success lies in adapting the artificial methods to meet the necessary requirements of the animal.

The conditions around the young horse stock of the farm in winter are so different from the natural that many of the diseases that afflict the animals in after years are generated in their organisms while under the average care in colthood. The number of queries that reach this office asking advice as to tonics and medicines for certain apparent maladies, gives evidence that many farmers still beleive that tonics can take the place of good food and good care, or at least they will put to rights the ravages of close confinement and poor feeding.

The "Condition Powder Craze

There are a host of popular ideas abroad with many farmers about the virtue of certain drugs and their believed magival effect on the horse. Under the name of "condition powders" large quantities of secret preparations are sold throughout the country, the avowed object of which is to restore to vigor horses which are out of condition, and to increase their appetite. The majority of these powders do more harm thai good. They are generally composed of stimulating and heating substances, and unwisely administered, by persons ignorant of their composition, they often give, for a time, an appearance of health and vigor to the animal, followed by a worse attack of disease.

It takes close observation to follow the dictates of nature in feeding horses, and colic, indigestion, inflammation of the bowels, impaction, and the more severe forms of a sickness following these ailments, is due to the failure to feed clean, wholesome food, or failure to feed regularly. An intelligent caretaker is the greatest factor in bringing success, while the slipshod, non-observant feeder is a loss though his services may be given free. This fact holds good with all classes of farm live stock. Sick horses are many times the result of failure to observe some of the simpie rules of health that nature teaches in governing horse treatment.

Out of Condition Animals

When a horses's general health is termed as being out of condition it may be applied to two very different states of the system. One is where the animal has been well fed and cared for, and is sleek and seemingly robust. But he begins to get particular about his food, searches for dainty morsels, loses much of his appetite, the eye is dull and bloodshot, there is an absence of spirit in the animal, and a general want of tone.

Now, this is nothing else than what medical men call a state of plethora; there is a formation of superfluous blood and fat, owing to too rich and abundant diet, and an insufficiency of exercise and pure air. When a horse is in this condition medicines are usualy of little use, and the quack "dope" may be decidedly dangerous. All that is required in a case like this is a change to a poorer diet, and a diminished quantity, and if abundance of exercise is given, these symptoms will soon pass away. If it is an extremely bad case it may still persist after this natural remedy. Then a small dose of aloes, say four to five drachms twice a week, should be given; and an ounce of saltpetre placed in the water about as often. These agents act on the bowels and kidneys, and will soon relieve the overloaded system.

Another form of "out of condition" is seen in young neglected colts, or underfed working horses. The coat is rough and staring, the skin dry and often hidebound, the bowels are irregular, and the animal has lost its natural "fire." With a young horse once down to this condition it is doubtful if ever he can be courted back by any kind of treatment, to resume the vitality he had when a sucking colt by the side of his dam.

The spirit and vitality he had then ought to be kept with him through life. No better ideal can be set up for horse rearing, than the spirited, thriving, young colt before weaning; a product of nature that too often gets the check that irreparably stunts it for life. To expect that condition powders wil lrepair the damage thus done to a young colt and that it is a short cut to removing the evil, will be fraught with failure, unless it is backed up with very painstaking feeding and care.

With too many farmers hay is hay, whether it is clover or timothy or whether it has come off sour land or land that has the fertile properties of lime and phosphates. In frame or bone building, the colt requires mineral matter in its food. In order to obtain ample bone growth in the young colt it is essential that an abundant supply of the soil ingredients for the formation of bone should be available in the soil. This is the natural way of providing the mineral matter in food, and avoids any risk which some are tempted to take without skilled knowledge in supplying mineral matter in feeds.

It is always a risky undertaking to drug young growing colts, prevention against an out of condition state should be practiced. If, however, one is found to make but poor headway in regaining health or attaining maximum growth, it is possible by judicious use of medicine, along with charged anad better quality of food. to give the colt a new start. But one thing to always remember in giving a colt drugs, or tonics is to never apply them when the colt is shedding his coat of hair.

The methods of courting the young colt back to health and vigor can likewise be given to the hard worked and often underfed horse. In every case the trouble is indigestion and the secretory organs must first be restored to activity. Grooming and cleaning the skin thoroughly, and an ounce of salt petre should be given in a mash every other day to excite the kidneys; a moderate dose of aloes given, and soft, easily digested food.

Some science and observation is needed too, even in feeding hay. The notion that clover or alfalfa hay is injurious to horses anda that clover hay causes heaves, come sfrom not understanading the horse and the feed. Timothy hay does not cause heaves because horses will not eat enought of it, they do not like it well enough. Over loading a horses's stomach, especially when a horse is called upo nto work in that condition, with any forage may help to cause heaves, and the belief that clover is a heave producer is established because horses eat a lot of clover when they can get it and most farm horses are fed too much hay. Neither clover or alfalfa is injurious when fed in moderation.

Feed alfalfa at the rate of about one pound of hay per day to each hundred pounds of horse, if grain is fed, and a little more won't hurt if the horses are being wintered on a hay diet. Never cram the horse mangers full of hay.

Roughage is the chief natural source of mineral matter in feeds, and clovers and alfalfa are much richer in this respect than other forage. This suggests the filling up of growing horses and working horses in winter on clover, alfalfa or kindred hay, and then supplying enough grain, principally oats, to maintain a suitable degree of flesh to accompany rapid growth in the young horse or motive power in the work horse.

his actions accordingly. Horse dealers, like dealers in other commodities, will pay the highest price for what they can sell the best, which means that they have constantly in mind three distinct attributes, the relative importance of which is probably indicated by the sequence in which they are mentioned, viz., quality, condition, and manners; soundness, of course, being understood.

A good horse in poor condition is always a poor investment for the dealer, as he cannot be disposed of for anything approaching his real value, while a very ordinary animal in prime fettle can be sold for the last cent that is in him. Always remember that a better return for feed used and time expended can be had in conditioning horses for sale, then in fitting any other kind of farm stock.

Good manners in work horses is a most important attribute, and one the intelligent buyer is always ready to pay for. A horse of the finest conformation and quality, if balky, vicious, or hard to handle is practically useless, while ordinary animals, if thoroughly educated, are a canstant source of satisfaction to the man who works them Good manners, however, cannot be taught in a day; they are the result of careful and intelligent handling. Breed to stallions of good temperament, as vice is very often inherited.

In good horse producing localities co-operative effort should be along the line of establishing regular sale days at local centres, where horses could be taken for sale. Once properly advertised there would be no dearth of buyers, as dealers could thus avoid the exepnese and trouble of driving the country to find out where a likely sale co uld be made. Wherever there are horse producing areas, concerted ffort should be made to properly advertise the fact.

YOUNG MARE THAT INTERFERES

I have a three-year-old mare that interferes, what way could I get her shod to prevent it? What will take away the lump the interfering has caused?—M. S. S.

Reply.—It is difficult to advise you without seeing the animal as interfering may be caused by a variety of causes that make the foot that is going forward strike against the other leg. Colts before being shod never interfere, but often do it as soon as shod. The shoeing is a common cause, the foot is often pared down too much on the inner side, tipping the fetlock in so as to bring it in the way of the other foot. Take the horse to a shoer who is an artist at the business. As a rule no two feet are alike, and it requires an artist and a mechanic to change the position of the feet and legs resjectively. A good rule to follow is to shoe so as to tip the fetlocks out, giving the feet room to pass without brushing. This is done by leaving the inner side strong and paring down the outer side, which will throw the centre of gravity in a new line and often prove successful. If the horse is overworked, thin and weak, give him a rest and a little better feeding. There is no plan much more effectual than to spread the legs with good solid flesh, making him travel wider.

An efficient, cheap and useful lotion to aid in removing the bruise will be found by mixing together acetate of lead, one ounce; vinegar and water, each one pint.

TWO-YEAR-OLD COLT HAS MANGE OR ITCH

I have a colt, coming two years old, that is not thriving. She seems itchy all the time and I cannot find any vermin on her. She has rubbed most of the hair from the root of her tail.—P. H. F.

Reply.—Your colt is evidently suffering from mange. The insects that cause the itching are hardy visible to the naked eye. This disease is very contagious and measures should be taken to keep the colt away from the others, and also thoroughly clean and disinfect every blanket, every piece of harness, curry comb or utensil that has touched her. In all cases the utmost precautions should be taken to prevent the disease from spreading.

Make up an ointment with the following ingredients: powdered staves-acre two ounces, lard eight ounces, olive oil one ounce. Mix at a gentle heat. Before applying the ointment, wash the parts with warm water and soap to remove the crusts, dirt and scabs, then dry thoroughly, otherwise it will not reach the insects, especially the varieties that burrow into the skin.

CORNS IN HORSE'S FOOT

Please inform me what can be done to cure corns in a horse's foot.—E. P.

Reply.—Corns are only found in the fore feet, and almost always on the inside heel. They are caused by bad shoeing or wearing the shoe too long a time.

The shoe should be removed and if there is inflammation the foot should be poulticed, and if the corns are festered, an opening made to give vent to the pus. The seat of the corn should be pared, care being taken not to cut out portions of the bars or the frogs. As a corn salve, use the following: Tar, beeswax, honey, of each one-fourth pound; glycerine, three ounces; lard, half a pound; nitric acid, two drachms. Melt the lard and beeswax to gether, stir in the other ingredients, and stir till cold.

STALLION EXERCISE

The stallion that has stood in a cramped dark box stall since the close of the breeding season last summer is not likely to be a very sure foal getter. Stallions in heavy service should be walked at least six miles every day during the breeding season and should have exercise every day in the year if they are to be kept in the best possible condition for service.

Leguminous plants are of special value in feeding animals as well as for improving the fertility of the soil. The hay of leguminous crops is rich in protein and also carbohydrates, hence is more economical for animals than hay made from non-legumes.

FROM OUR FENCE FACTORY
SARNIA FARMER'S FRIEND FENCING
THE SARNIA FENCE
FACTORY to FARM
The most satisfactory way to buy Fencing is from a responsible Fence Factory where you get first service at Factory prices. That's us--we make Fencing for and sell to Canadian Farmers. We will save you a lot of good money if you deal with our Farmers Fence Factory. Prompt shipments made. Fencing fresh from the loom—always highest quality. Lowest prices on all Sarnia Farmers Friend Fencing, Sarnia Gates, Barb Wire and Fence Supplies. Costs no more to erect a Sarnia Fence with full gauge wire, heavily galvanized, rust resisting. Full measurement. Full size rolls and full weight. An honest service and a square deal. Our methods and our Fencing vouched for by thousands of satisfied users—Canadian Farmers throughout the Dominion. There is a good reason—it sells because it excells. Speaks for itself and stands for years as an advertisement of Sarnia Fence Satisfaction and the prosperity and good business judgment of Sarnia Fence users—
For Every Fencing Need
SARNIA
For Canadian Farmers
Will not sag in summer nor break in winter, conforms to uneven ground, up hill or down, as well as level ground. The strong line wires have a wave or crimp which gives elasticity and spring to the Fence, providing for contraction or expansion. The strain is evenly distributed on each wire. The Sarnia knot grips and stays tight—will not slip in any direction. We have saved the farmers of Canada many thousands of dollars by our plan of direct dealing from Factory to Farm—cutting out all dealer or middleman's profits and giving it to the Farmer.
Canadian Farmers must help supply the hungry nations of Europe by using every foot of ground for productive purposes. Have no waste fence corners cut plow to the line. Do not buy Fencing until you have our prices. Prepaid freight prices quoted in Old Ontario. Four cents a rod extra in New Ontario, Quebec and Maritime provinces. Western Canada supplied from our Winnipeg warehouse. Order now and be ready. Price list, order blanks, descriptive literature yours for asking.

POULTRY.

GIVE HATCHING EGGS A CHANCE

How They Should Be Handled.

Chicks that are healthy and well developed are those that come from well handled eggs. They are less liable to disease; better grown chicks; early winter layers; cockerels that are fit for broiling early; and pullets that will come broody early next spring. Early hatching and careful handling means gerater profit and better results all round.

Careless Hatching.—A large number of poor hatches are due to the fact that the hatching eggs have not been properly handled prior to the time that they have been placed in the incubator. One must remember that no matter how good the incubator, and how well it is taken care of, no incubator will hatch anything but the best eggs, and when one considers the complications which enter into incubation, and the many factors which are involved, it is surprising that as many eggs hatch or that as large a proportion of chicks are obtained from the number of eggs set. Because of these many difficulties which are involved in incubation, and because everything has to go along absolutely right, it is quite necessary and very important in order to secure good hatches, which means, of course, strong chicks, one must be careful in handling the eggs before they are ever set in the machine.

Ideal Handling.—Eggs should not be placed on their ends, but should be placed on the side, tilting slightly towards the point. It has been advocated by a great many, and it is being practiced still by many, to hold hatching eggs on their points. This is an unnatural position for an egg, and the saying goes that the only man who could stand an egg on its point was Columbus. As eggs naturally lie in a nest, they are on their sides. Had nature wanted these eggs held on their points, she would have given them another shape. The yolks in these eggs are held in place by the heavy, more tenacious part of the white known as the chalaza, and when the egg is placed on either end it is impossible for this chalaza to operate properly. The ideal way to handle hatching eggs previous to incubation is to gather them at least three or four times a day, and to place them in a cool moist place (40 degrees to 60 degrees F.) In holding eggs, it is well to keep a cover over them, as the dust which often comes from coal ashes or other sources is quite detrimental to them.

The Germ.—In considering the hatching egg as it should be, both as the germ from which the chick develops, and as the food from which this germ grows, let us first discuss the germ itself. When the egg is laid the germ is in what is known as the dormant stage. This is a condition which nature has provided to protect the germ while the clutch of eggs are being laid in the wild state, before the real incubation period starts. The germ in this state is able to withstand adverse conditions of temperature; quite low temperatures and quite high ones for a short time; it is able to stand quite a bit of jarring, and many other conditions which are very detrimental to the embryo chick as it later develops in the egg. It can be compared graphically to the buds on a tree during the winter tme. For nstance, it is a well-known fact that buds on a peach tree will stand quite severe cold weather during the winter. In the spring, when the warm weather comes along and conditions are right for these buds to start swelling or developing, they leave this dormant stage. They leave the stage in which they are protected, and it is equally well known that should a cold snap come along after these buds have swollen or left their dormant stage, that these buds will be killed by temperatures at this time which would not affect them in the least during the winter or during the dormant stage. The germ in the hatching egg is very much the same in this respect, and in the case of many eggs, which do not hatch, the trouble can be traced to this fact. Sometimes thees weakened germs will develop for the first seven days, but are not strong enough to go on farther. Occasionally they will hold on until about the fourteenth or fifteenth days before dying, but a great many of the germs weakened in this way die as full-developed chicks, just about the time when they are ready to leave the shell. Many have had the experience of having incubators almost full of eggs in which the chicks had reached full development, but lacked the strength to come through the shell, and they have been at loss trying to find fault in their method of handling incubators because their mistake had been made in improper handling of the eggs before they were put in the machine. Many cases of poor brooding can be laid at the door of improper handling of hatching eggs prior to incubation.

V. G. A.

THE BIRDS NEED SUNLIGHT

Poultry houses should be so constructed that sunlight may reach every part of the interior. Sunlight is our best disinfectant, and we should use more of it. By this it is not meant that the house should be built of glass. We must take into consideration the variation in temperature between day and night. Too much sunlight unduly heats the house during the day time and the more glass there is the cooler the house is at night. No rule can be given, but, roughly speaking, about one-third of the front might be given up to glass, and two-thirds to cotton. The shape of the window has something to do with the results. In deep houses (16 to 20 feet wide) windows should be arranged up and down, not crosswise; a window 3x5 feet, placed with the 3 feet up and down, will not be as satisfactory as if t were placed the other way. It is not that the windows placed vertically will allow more sunlight, but the rays of the sun going through a vertical window strike more of the interior, just as a wider broom takes a wider swath, so the rays of the sun through the windows vertically touch more space than when the window is placed horizontally.

Windows are better, if not secured fast. There should always be provision for opening them, and double windows should never be used. It is well, however, where high winds are prevalent, to have the windows arranged so that when they are opened up the draught will not strike immediately upon the fowls. This can be managed by hanging the windows on the inside at the bottom and a chain or rod used to let the top of the window into the house, more or less, as desired. The ordinary sash window serves very well in most locations. The top sash can be let down and the bottom still used to protect the poultry. Various hints for fastening windows are given but probably the most popular window and the one that gives the best results in most localities is the sliding window. A window that slides back and

Good Paint Saves a Great Deal More Than It Costs.

GOOD paint is never an expense; it is a way of saving. If you are in any doubt as to whether you can "afford" to paint your property, think this over. You paint to save something worth many times the cost of painting.

Everything depends on the QUALITY of the paint used. To make absolutely certain you must insist on *SWP*—*SHERWIN-WILLIAMS PAINT, PREPARED*—the proud result of over fifty years' experience.

SWP is prepared so that it meets every condition and climate in city and country in Canada. What goes into the can is plainly stated on the label—highest quality materials, prepared with conscientious skill.

For interior wall and ceiling painting, you will find *S-W FLAT-TONE*, exactly meets your needs.

You will enjoy reading "The A. B. C. of Home Painting"; sent Free upon request.

Look around for the *SHERWIN-WILLIAMS* Agent in your district.

forth can be adjusted to admit almost any portion of air required. With this style of window, however, much trouble will be obviated if there is no groove at the bottom. This groove always collects water and moisture. This freezes and the window is fast wherever it happens to be. The best arrangement for a sliding window is to have two small cleats nailed to the inside of the bottom of the frame and a strip arranged so that it holds the bottom of the window in place and upon which the two cleats rest. This allows the water to fall through and leaves nothing to obstruct the sliding of the window. For large windows the sliding style is much safer. The window cannot blow out and there is very little danger of anything breaking and allowing it to drop. Small windows, however, can be hinged with fairly reasonable safety.

DUSTY DIRT FLOORS IN POULTRY HOUSE

Dirt floors in poultry houses are cheap and possibly they may be a success when the right kind of soil is properly tamped, but we have found dirt floors from garden loam to be undesirable as much of the dirt floor is soon transformed into dust and liberally sprinkled all over the house. As soon as the hens are given their scratch grain in the litter, the air becomes so dusty that the attendant can hardly breathe in the house. This is not healthful for the birds. We have had more trouble with hens showing watery eyes from colds when they were on an earth floor. The dust in the air seems to aggravate the slightest irritation of the eyes and such colds are difficult to cure unless the bird is removed to a house where the air is always clean, even when the birds are at work in the litter.

The sand floor is much better than the earth floor as the air will be cleaner when the birds are at work. If sand cannot be obtained we believe it is better to use plenty of litter on a wood or cement floor and leave out the soil entirely as the flock will be healthier.

The best folor in our opinion is a cement floor on a well-draned location. This can be covered with an inch or two of sahd and plenty of litter. The cement floor is a cold floor, but it can be made very satisfactory with sand and straw. A sand floor is satisfactory without wood or cement beneath but these garden loam floors are, according to our experience, always dusty and such houses are bad for the health of the birds and also for the poultryman who must work in them.—R. G. KIRBY.

SIMPLE PREVENTATIVES OF POULTRY DISEASE

In some respects it is easier to keep the poultry house and range sanitary in winter than in summer, for heat is a great inducement to the rapid increase of bacteria. The cold in winter-time holds diseases in check, but on the other hand, the hens are so much more crowded in their quarters that the effect is much the same.

As most of the diseases of hens are contracted through eating or drinking, or at least through the mouth and nostrils, it must be remembered that it is essential to keep the drinking water free from germs. Drinking vessels are too often left without any special cleansing or attention for weeks at a time. When a sick hen drinks out of a vessel and infects the water it contains, if the water is allowed to stand without being renewed, an ideal place for the germs to multiply is the result, which more often than not leads to a general scattering of the disease throughout the flock. The strong hens may not show any sign of infection, as with them nature begins a stern resistance at once and will throw off the disease germs before they can increase enough to become dangeorus; but the weaker hens will not be able to resist so strongly, and finally the germs triumph, break down the resistance entirely and your hens die.

The chance of infection is greatly lessened when the water vessels are so arranged that the hens cannot get their feet into them from the floor of the house or pen. It is safe to put a drop or two of carbolic acid to each quart of water in the drinking water at all times, or dissolve a pinch of permanganate of potash in it, enough to color the water a light wine red. Also keep charcoal where the hens can pick it up whenever they wish, and you will be giving them the best protection possible.

CANADA'S HENS COULD PAY FOR WAR

"Poultry and eggs could pay Canada's National War Debt," says Mr. Fred C. Elford, Superintendent of the Poultry Division of the Dominion Experimental Farm, Ottawa. And he produces figures to prove it which he will send to anyone on request.

The interest on our debt of $1,247,000,000.00 as on October 31st, 1918, at 5½ per cent., will amount to $68,585,000.00. We could pay this interest and apply a balance of $213,415,000.00 to reducing the principal every year, and in less than six years Canada's hens could wipe out the total monetary cost of the war to Canada, and our total net national debt!

DON'T WASTE EGG SHELLS

Poultry-keepers would do well to bear in mind that egg shells, after the eggs have been used, should never be thrown away or be consigned to the dust bin, as is frequently done. They should be given back to the hens in the form of shell material for future eggs.

Such shells, however, ought never to be given merely crushed, unless one wants the hens to acquire the egg-eating habit. Before putting the eggs in the gritbox, abstract any of the white that may be adhering to them, place them in the oven until dried, and then pound them finely.

The grain you feed the poultry in winter should be scattered in a deep litter so as to make the hens scratch for it. It wiill give them good exercise and also keep them warm.

Be sure to give the poultry plenty of pure air and sunshine.

A bird with closely worn toe nails is considered a better layer than one with long nails.

Strength
Where Strength is needed

Every farmer knows that a gate is no stronger than its weakest part—and that the weakest part is usually the hinge. When this becomes twisted, the gate sags, and its usefulness is gone.

We have succeeded in designing a gate that is strong throughout, but especially strong as to its hinges—so strong that it is impossible to twist its hinges out of shape, even a fraction of an inch. In the

Invincible Gates

the unique feature is the setting of the steel hinge plugs in the extreme corners—we weld them there by electricity. Also, we weld the pipe stays to the one-piece frame; with the result that we have a gate as substantial as if it were one piece of steel.

With hinges set wide apart, the gate swings easily on its posts; and there is no indirect or bending strain on the frame—the strain on this "Square cornered" gate comes right in line with the upper and lower hinges—where we have provided the necessary strength to withstand it.

You would expect such a gate to cost more than a ordinary one—but this gate costs you no more than the round-cornered style, in spite of its special features of design and special strength of construction Invincible Fencing and Gates are sold and recommended by the better class of dealers throughout Canada; and the Farmers who have first-hand knowledge of their quality through years of use are telling their neighbors that there is true economy and very real satisfaction in buying these strictly high-grade "Made in Canada" Products.

Illustrated Catologue showing the various styles of Gate we make, will be sent on request.

THE VAMP

(By Inez Haynes Irwin)

"Isn't Molly coming today?" Phoebe Warburton asked of her sister-in-law, Sylvia Martin.

"She said she was," Sylvia answered. "I can't understand what's keeping her. It's her boast that she's never late to the Sewing Club."

"Yes, she does enjoy it," Mrs. Fall remarked, "it means a lot to her."

"It means a lot to all of us," Mrs. Day said gently. "I'm sure I don't know what I would do without ti. It has grown into my life so."

"It gives you something to look forward to. I find myself thinking of it all the week." Sylvia spoke a little absently. She had an occasional eye and a constant ear for the kitchen. From that direction, a door opening frequently let out the sound of cream being whipped.

"Iv'e been think of it a lot lately—analyzing it," Phoebe went on. "I think one reason that we enjoy it so much is that it's a comfortable way of growing middle-aged together."

"Middle-aged! Phoebe, you monster!" Mrs. Brodbeck charged.

"Yes, middle-aged!" Phoebe stood stanchly by her guns "We've reached the age, every one of us, when we're letting down, all along the line. We do over our last winter's evening colthes and our last summer's hats. We don't get massaged or marcelled or manicured. Oh, I suppose it's bound to be—"

'Yes," Mrs. Fall decided, "it can't be helped with children growing up! There's so much to buy for them—"

"Here's Molly now!" Sylvia exclaimed. "Oh!" This "Oh!" was merely recognition of Maggie who came in, wheeling the tea-wagon. Sylvia busied herself with the cups.

"You'r fired!" "Youre expelled!" "Charges will be preferred!" came in chorus as Mrs. Meredith entered the room.

Mrs. Meredith did not smile. She slowly drew a worn fur piece from about her neck; slowly took off her hat and coat. 'I've been long-distancing."

"Nothing serious, I hope?" Mrs. Brodbeck queried.

"Of course it's serious," Phoebe declared. "Not one of her dimples is on the job."

"I don't know whether it's serious or not," Mrs. Meredith said without smiling. "I don't know whether I'm in the worst pickle I ever was in or not. I dont know whether I'm a malefactor or not. I feel as though I was going to start a terrible epidemic in this town. I feel as though I was one of those human disease-carriers that you read about in the magazines."

"My goodness, Molly!" Phoebe broke, "what are talking about?"

"Listen!" Molly answered. And even now, not one of the dimples which Phoebe had predicated, appeared in the dusky round of her cheek. "You remember that I got a note from an unknown female about ten days ago, enclosing a letter of introduction from an old friend of mine, Alice Robinson? And perhaps you remember that the unknown female said she was coming to Boston, and that I invited her to spend a week with me." Her eyes, travelling about the circle of faces, apparently culled enough or recollection, for she went on—"Well, this morning I got a letter from Alice. I'll read it. It shouts for itself in large, round, emphatic letters:

Dear Molly:—In a few days, a girl from this town, Sybil Storrow, will present to you a letter of introduction, which I have just written for her. She's going to Boston for a visit and knowing that I had friends there, she asked me for letters. I was very glad to give them to her because Sibyl is a perfectly dandy girl. And yet, I thought I would like to write an extra word of explanation—something, as you will readily see, that would scarcely go into a letter of introduction. Somehow, it seems only fair to you to do this. I'm not quite sure that it's fair to her; but in thinking it over, I have concluded that I have no choice in the matter. Anyway, I'm taking the chance. So here goes!

As one woman to another, Sibyl Storrow is absolutely all right in every respect but one. She's perfectly honest in money matters; keeps her engagements; is straight, in short in all ways in which we like a woman to be straight. But nevertheless, ther's one thing about her. She's a flirt. She's an awful flirt. She's the worst flirt I've ever known in all my life. I don't think she means any real harm. Sometimes I think she can't help it. She was born that way. But she's rather exasperating to other women. Everything in trousers is fish for her net—babies in the cradle, boys in prep school, college men, middle-aged business men, doddering, senile wrecks—from nine to ninety she goes out after them all. And she gets them. That's the worst of it—she always gets them. There's something about her—what it is, search me. She makes me think of a song I've heard somewhere:

"What it was that Mary did,
Mary didn't know;
But everywhere that Mary went
The men were sure to go."

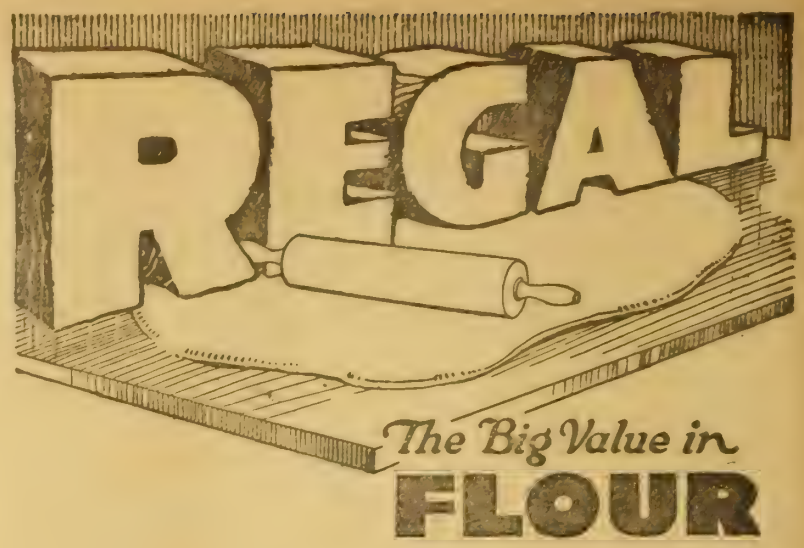
She isn't very pretty, although she does know how to dress. But she's got something about her that most women don't have. She can't help what she does. She attracts men—that's all there is to it. And so, my warning is—look out for sons, brothers, fathers, husbands, sweethearts. She's perfectly impartial. As I said before, I think she is harmless; but fascinate men she must and does.

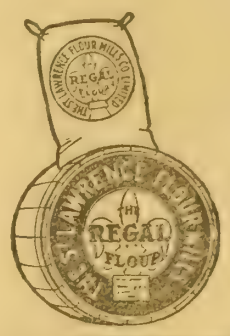
Now if it proves that I've unloosed a human scourge on your neighborhood, please forgive me. What else could I do when she asked me for letters?

Yours with love, but in great perplexity, Alice.

Now what do you think of that?" Mrs. Meredith demanded.

All her dimples were playing now. She was a pretty woman; rounded in contour; velvety in surface; duskily dark. She paused an instant to look into the glass, to pull down a rather tumbled waist, and to adujst the mussed lase at her neck. There was a stir in the room, as much psychological as physical. Mrs. Brodbeck and Mrs. Fall made an effort to blank their expressions. Mrs. Day's face took on an unmitigated seriousness. Sylvia alone showed no change. She went on serenely pouring tea. But Phoebe frankly laughed. "It sounds





IN making tea biscuits and pastry, there is no flour that gives better satisfaction than "REGAL". Biscuit makers consider "REGAL" the BIG VALUE in flour.

to me as though there was going to be some doings in this town," she said.

"When is she coming?" Mrs. Brodbeck asked.

"Tonight," Mrs. Meredith answered.

"I wonder what she looks like?" Mrs. Fall dropped, in a little flat interval of seriousness.

"I haven't the remotest idea," Mrs. Meredith answered.

"Sibyl," Mrs. Day said musingly. "It' sa pretty name." Her China-blue eyes reflected in one of Sylvia's long, old-fashioned mirrors. They seem to take reassuring cognizanco of the white-and-gold prettiness they met there.

Phoebe sighed ostentatiously. "Well girls, I suppose we'll have to get out our old duds and do our best to compete with this whirlwind among men. Not that I personally think I have any chance. But if a vicious vampire is determined to tear my husband from me, I supose I won't give up without a struggle."

"Oh, she'll have an easy enough time with Tug," Mrs. Fall remarked. "Everybody knows how hard Tug is straining at the matrimonial leash.

"Pelase come to a party at my house tomorrow evening," Mrs. Meredith begged. "Bring your husbands and all adjacent males, encumbered or unencumbered. And let the slaughter begin at soon as possible. Of coure I'll sacrifice Elliott on the altar of hospitality, immediately. By the time you arrive she'll probably have swallowed him whole. But unless she falls into a state of torpor in order to digest him, I shall expect you to hand over your loved ones, one at a time."

"Tug," Phoebe commanded, "this is the night you are to put on your glad rags. This is the night I hand you over to the Circe from the Middle West. Of course, she will have snatched you from me forever, before we get home this evening; so I will now take this oportunity to bid you a long and lingering farewell. You've been a good husband to me Tug, and I wish I could have kept you. But with a young woman in the game, the mere mother of your six children must expect to go into the discard."

"Well, of course," Tug remarked, "the easiest thing I do is to fall for this vampire stuff. All my life I have hoped that some enchantress like this lady from Troy would decide to enslave me, no matter what the cost to herself or me. In farewell I will say, Phoebe, that you have been a very satisfactory mother to my children. I hope that your life isn't ruined and that some day you may meet another man who will make you really happy."

"That's nice, Tug," Phoebe responded with the dancing eyes which always accompanied the nonsensical dialogs which were her delight and Tug's. "Nobody could fill your place. I will say that, if you had taken my advice, you would have had a slimmer figure to present to this enchantress."

"It doesn't make any difference about my figure, woman," Tug remarked with much heat. "One look at this face, featured like a Greek god, and it's all off. It seems to me that you are looking pretty brisk this evening yourself, Mrs. Warburton."

"Well, of course, I am doing my feeble best to retain the father of my children," Phoebe explained meekly. And she gave a sidewise glance at the shining lights of her tulle-hung, blue evening gown. "Haven't been able to make up my mind for a long time whether I could afford a new evening gown or not."

"I'm glad you decided you could," Tug said heartily. "That gown is a bird. You look great."

When they entered Mrs. Meredith's charming big living room, every chair seemed to hold a coruscating specimen of womanhood. The couch, however, a big, high-backed affair, was surrounded with black-and-white masculine units. It was not until Mrs. Meredith said, "Miss Storrow, I want you to meeet . . . . " that its contents were revealed.

Then there disengaged itself from the black velvet background, a slight figure in white. That white was lustrous?surfaced. It dropped from slim shoulder to slimmer ankles in long lines that seemed a piquant combination of the mode of Greece with Paris. At the neck, a square of flesh showed a slight olive contrast with this ivory shimmer. Miss Storrow was a brunette, although she was pale; and her eyes were a little indeterminate in color and character. Her jet-black straight hung so close to her head that is might have been glued down; it invaded her forehead, her ears, her very cheeks in long shining loops, equally flat.

She acknowledged the introductions with a little jerky nod, and, turning immediately to a near-by mirror, proceeded to apply a lip-stick so vigorously that her mouth seemed to turn into an opening poppy. It echoed, that opening poppy, the scarlet of the long coral earrings; the scarlet of tiny, very pointed velvet slippers; the scarlet of a long, tasseled bag—the only bits of color in her costume.

The phonograph started the instant Miss Storrow had performed this delicate operation. "I've not danced with Mr. Warburton yet," she said. She glided in Tug's direction and that frankly-astonished gentlemaan suddenly found himself whirling her about the room.

Phoebe, with much amused gray eyes, watched their progress. "I take off my hat to her," she remarked under ner breath, seating herself beside Mrs. Day.

"Oh. you've lost most of it!" Mrs. Day said regretfully. "It's been wonderful. Well, will you look at that?"

(Continued next issue.)

THE MODEL KITCHEN

Some years ago our kitchens, as a rule, were not made so convenient as they are at this present age, for as the years have ben advancing we can see the disadvantages we have been put to in our work. The kitchen, the most important room in the house, generally lacks proper light, and ventilation, and being at the back of the house, rarely has a pleasant outlook. The best room is probably toward the view and too often closed and unused, while the housewife spends most of her waking hours in a kitchen backed toward the barns or washing dishes against a dead wall.

I would confine myself to two rules for constructing a model kitchen, and if you keep them in mind, when you make over yours, you will not go far astray.

The first rule is to make it convenient, and the second is to make it neat and cheerful for the one who spends the greatest amount of time in it.

To make the kitchen cheerful it would be well to have the walls and ceilings painted with as light bright tones as possible, such as pale green, bright blues, or fawn, with contrasting wood work as light as possible, also the floor painted light, or covered with linoleum. By painting with light colors, the kitchen is brighter and appears larger, thus giving a pleasanter sphere to work in.

The color note can be carried out in a bright colored scrim curtain, or a white one stencilled. Paper on the walls is not considered sanitary, as dust and odor adhere to it, also pictures and ornaments are objectionable. A clock is useful and ornamental.

It is well to have a ventilating hood over the cooking stove so that odors may be carried off . Where electric light cannot be obtained, the position of a hanging lamp is also important, or a rflector and and an extending bracket will often help the plain kitchen lamp to give better service.

If you are to save steps and time, this means that it is important to have the pantry, kitchen cabinet, cooking stove and table as near as you can ato one another. You will find it labor-saving in many ways. The sink should never be placed in a corner. If possible, put it where there is light from a window. The best place for it is the midle of a wall space, with a good drip board on either side of it and a table to the left.

Another helper to time and steps is a carrier conveniently arranged to convey the dishes and food to and from the dining room as required.

Time and steps saved are money saved, even in the kitchen, for the kitchen is the engine that runs the home machinery. I assure you it makes for happiness, as well as for

WIFE'S COLD

Husband's Bronchitis

CURED BY

DR. WOOD'S

NORWAY PINE SYRUP.

Mrs. James Mack, Trenton, Ont., writes:—"I suffered for several months with a bad cold. Some friends told me about Dr. Wood's Norway Pine Syrup, and of the benefit it was to them. Before I had used two bottles I could get some rest, which I could not do before. I had tried everything, but "Dr. Wood's" was the only thing that gave me any relief.

My husband suffered terribly from bronchitis, and did not know whether he was going to recover or not. At my druggist's, Mr. J. H. Dickey, I was advised to try your syrup, which I did, and am so thankful that I cannot recommend it highly enough."

Many people on the first sign of the slight cold or cough neglect it, thinking, perhaps, it will disappear in a day or two, but the longer it is let run the worse it gets until it settles on the lungs and serious results ensue.

On the first sign of a cough or cold, get rid of it before it gets settled. Take a few doses of Dr. Wood's Norway Pine Syrup and see how quickly it will disappear.

This sterling remedy has been on the market for the past 30 years, and stands head and shoulders over all other cough remedies.

Put up in a yellow wrapper; three pine trees the trade mark; price 25c. and 50c. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

health, to have a beautiful as well as a convenient kitchen.

Written by Mrs. Geo. J. Dickson, Centre Napan, N. B.

A SEASON FOR SEWING, CLEANING AND GARDENING

In April begins the season when many housekeepers want to spend all their time in each of three different ways: spring sewing, spring cleaning and early gardening. But try to plant a wise adjustment and average up the time. On rainy days, sew. In pleasant weather, clean. Garden a while each fine day. You will find it a rest and a pleasant change, and the accomplishment of work will be gratifying. Above all, allow a liberal margin for outside recreation and mental refreshment.

Fresh vegetables are scarce, so use freely the parsnips and salsify dug from the garden. Try different recipes, that you may get variety. Have the garden plowed, have the lawn rolled, and the perennial beds and chrubberies fixed for summer. Transplant house-started seedlings to the cold-frames. Plant in close rows in the frames flower seeds you wish to hurry. Spade over the asparagus bed before the stalks begin to appear. Take up the board walks. Do any grafting you may have planned.

Kill the first flies and moth-millers. If you can accomplish this, you will save much further trouble. Each month put a strong solution of washing soda, followed by clear hot water, down bathroom pipes. Do the same thing in the kitchen sink. Instead of the washing soda any one of the chemical anatiseptic solutions may be used advantageously. See that the garbage can is in perfect condition before hot weather sets in. If you do not find it strong enough to last through the season, discard it and get another.

The entire contents of each clothes closet should have a day's sojourn on the line in the open, blowing air on a sunny day. Pack them away in a garment bags that come for the purpose. In city homes, all winter garments should be first sent to the cleaners for thorough pressing. Garments thoroughly aired, brushed, and put away early in the spring are seldom injured by moths. Air and put away the remainder of the winter blankets and puffs, slecting a clear, windy day. Put up the screens; they will help to keep out the first flies, saving much trouble later.

The time has gone long since when mother "did all her own sewing." The increasing excellence of the ready-made garment and the real financial gain in many cases make it a serious question if many garments should be made at home. Most mothers, however, find the make-overs are still imperative and demand personal attention. Plan a dress parade; note the garments to be lengthened or repaired, or to be made over. Note any new garments and material that must be purchased before hot weather.

This is an ideal month to inspect kitchen and pantry equipment. Fill in the tableware and utensils that have been depleted by breakage. Weed out much-worn and out-of-order utensils. Now is the time to have the kitchen walls painted and the ceiling whitened. You can even do the painting yourself. Take this season to install some little improvement or new idea you have had in mind but have not taken time to accomplish. Glass containers are ideal for holding pantry supplies. Make the shelves shipshape and trim in their new dress.

Install an incinerator in some corner far away from trees. It may be home-made, using one and one-half yards of wire, square-mesh wire. Lap over and twist the cut ends of the wire to form a varrel-shaped container. Use a square of the same mesh and hinge it on for a cover. Fasten to the ground with a couple of bent wires. Empty the contents of scrap-baskets, and surplus paper not good enough to keep, each week, and set afire. The debris will burn rapidly with no danger of setting anything afire. Never let burnable rubbish pile up in your cellar.

WOMEN'S INSTITUTE DIVISION

Marc 29, 1919.

Dear Members:—

A Short Course in Cookery, Home Nursing, Dress-making and Millinery is to be held in the Agricultural School, Sussex, April 29-May 9, 1919.

Expert teachers have been engaged by the Department to give practicable instruction in these subjects.

All railway fares will be returned, providing vouchers for same are sent to the Supervisor of Women's Institutes, Fredericton, N. B., immediately upon completion of the Course.

A five dollar prize will be awarded in each class for highest total of credit marks in practice and written tests.

In Cookery Classes each student will need to bring two large aprons and a goodly suply of hand towels.

In the sewing class materials to be made may be brought by students or purchased in the town where the Course is held.

In the Millinery Classes the teacher will have new shapes on hand for sale and wil ladvise students concerning materials to be used for making and trimming hats. In both Sewing and Millinery classes, students will need to have sewing aprons and work bags containing scissors, thimble, thread, measuring tape, etc.

In all other classes students will need to bring note books and pencils in order to make additional notes to those suplied by the teachers.

Applications may be made for all classes (this we strongly advise if possible) but students are at liberty to make a choice of classes, providing such choice is specified in application.

This is a big opportunity open to you. Take advantage of it and **apply at once.** Applications will be acepted in the order received.

Yours sincerely.
HAZEL McCAIN,
Supervisor.

KEEP CAREFUL WATCH ON THE WEIGHTS AND MEASURES

All of us are interested nowadays in pratical plans whereby we can effect a real economy, and we are no longer

AN ACHIEVEMENT BUILT ON MERIT

Remarkable Record of Famous Remedy

OVER 480,000 boxes of these little doctors sold each year.

Think of it! A box of Gin Pills for every 16 persons in Canada. A tremendous army of users who have found relief from kidney and bladder afflictions by using this safe and tested remedy.

The enormous sale of Gin Pills is not the only evidence that these Pills work wonders—Thousands of testimonials from persons who have benefited by their use prove that as a remedy for Backache, Brick Dust Deposits, Sciatica, Lumbago, constant Headaches, Gravel, Stones in the bladder, and other kidney or bladder afflictions—Gin Pills have no equal. Try them and judge for yourself.

Sold everywhere for 50c. a box.

The National Drug & Chemical Co. of Canada, Limited,
Toronto, - - Ontario. 214
U.S. Address: Na-Dru-Co., Inc., 202 Main St., Buffalo, N.Y.

cornful of small things.

The war has made the penny popular—so popular that 3,000,000 new ennies are made every day to meet ne deman—and one of our mints has ben directed to turn out nothing but ennies. So if we only save one here nd one there, or several on a morng's marketing, the aggregrate will otal a surprising sum in the course f a year.

All these points may not apply to ou, but if one of them does, you will e well repaid for your time of readng, clipipn gthis article, and pasting r pinning it where it will serve as a requent reminder.

Have a reliable pair of scales in our own kitchen. Weigh or measure roceries which are delivered to you, nd if there are any shortages, imediately notify the firm which is at ault. Compare weights and measres with the grocery slips and see hat these and the price are right. Mistakes are bound to occur. See hat the pointer stands at zero when he weighing process is begun and hat it has come to an unaided rest vhen the weight is taken.

When you buy anything by the dozn, see that the count is forrect—oranges, bananas, eggs or cookies. See that the number is correct and he quality reasonably uniform.

When you buy of an unknown huckter or peddler, observe his license number so that, if you have been short-weighted, you can notify the Bureau of Weights and Measures and prevent other housewives from being taken advantage of similarly.

To buy from a merchant with dented measures is to lose part of what you pay for. Inform yourself as to he law concerning the selling of iquid-measure and dry-measure commodities, also whether the law requires that the capacity of the measure be plainly marked upon it.

Don't chat with the merchant or clerk while he is weighing or measuring your purchases, as this is likely to cause him to make an error. Scrutnize carefully the quality of articles advertised at unusually cheap prices. There may be perfectly good reason why the merchant can sell good goods and good measure for a low price, but be sure that the bargain is real and not merely seeming.

It is poor business to ask for ten cents' worth or twenty-five cents' worth of any supply ,or to accept unquestioningly a package, glass, jar, or basket. Know exactly what you are buying according to standard weight or measure, so that you can compare the price per pound in the glass or jar with the price per pound bought in other ways.

When you buy butter, lard, or anything commonly put into wooden containers, see that the purchase is weighed with paper under it only. Wooden dishes weigh from one to three ounces, and should not be paid for at creamery butter prices.

Do your marketing or shopping in ample time so that you can make your selections wisely and not be forced into buying high-priced articles lacking nourishment, because there is not time to prepare the ones whcih require slow cooking.

Insist that all trimmings of meat for which you pay are sent home to you. These can be used in the soup kettle or tried out if fat, or used as food for the family dog.

If you are buying a piece of meat, such as a leg of mutton, part of which projects beyond the pan of the spring-scale, the butcher should not hold on to the projecting part, as pressure adds weight.

If your bureau of Weight and Measures has any printed literature for your guidance, obtain and study it so that you may know what your rights are.

An awkwardly placed scale pin is liable to bring the pressure upon the "runner" if it is a hanging spring-scale See that the pan is properly placed.

Learn to read both spring and computing scales.

It is impossible many times for a butcher to cut exactly two or three pounds. Require that you shall know the weight as well as the price.

Learn to read your own gas and electric meters and accompany the representative of the Company when he comes to read them. Sometimes inefficient help is employed.

Watch bills carefully upon which there is an extra percentage charged after a certain date, or upon which there is a discount or rebate previous to a set date so that full advantage may be taken of such savings.

Learn to gage the family wants accurately so as not to overbuy. Most families are xeceedingly liberal providers. There is real art in having enough, but not too much.

BLACKING A STOVE

In blacking a stove there are various simple additions which improve the result.

1. Use turpentine, and a little sugar, to mix ordinary blacking. It prevents rust and makes the polish more durable and glossy.
2. Mix the polish with soapsuds; or shave good hard soap into the polish and boil them together.
3. Mix the polish with vinegar and just a little sugar.
4. After blacking a stove, apply linseed oil with a woolen rag, and keep a slow fire until it dries It prevents rust and gives a lasting varnish.
5. Mix the blacking with cold coffee instead of water.

When blankets are stored away, cut up some good yellow soap and lay the pieces among the fold; this will keep moths away.

After paring onions, to remove the smell from the hands burn a piece of coarse brown paper on the hearth, hold the hands in the smoke, and the smell will quickly disappear.

"Oh, You Do Look So Strong and Well"

"AND why shouldn't I ?"

"You always wrote about how well you were, but we never thought you would be so hearty-looking as you are after all the hardships of camp and trench life."

"Oh, we had our share of hardships, all right, but except on rare occasions we hed plenty of good, wholesome food and lots of fresh air and exercise. That is what makes a person strong and well. But I don't think I have it much over you. What have you been doing to look so hearty ?"

"Didn't I tell you I was using Dr. Chase's Nerve Food ?"

"You don't mean to say that has made such a difference. You were so thin and pale when I went away."

"Yes, it certainly has, and after you went away I had a regular break-down, and was in a bad state for some months. I had nervous headaches, could not sleep, and grew down-hearted and discouraged. Mother got after me to try the Nerve Food, and I am so glad I did, for I did want to be well to welcome you home."

"It is a joy to me to find you so well. And now that we have such a good start surely we can keep well and enjoy life. My experience overseas has caused me to place a greater value on life and health than I ever did before, and your experience with Dr. Chase's Nerve Food convinces me that you women folks need not be pale and weak and nervous if you will but use it when you feel tired out and run down."

Dr. Chase's Nerve Food, 50c a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto. Every box of the genuine bears the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author.

SOIL MANAGEMENT INVESTAGATIONS IN A YOUNG APPLE ORCHARD

(Continued from page 767)

by means of soil thermographs. As the soil temperature is largely a reflection of the air temperatures, the extent to which soil temperature can be controlled by cultural practices is quite limited. The data do not support the opinion that rain is of importance in warming the soil. There is no indication that the single factor of soil moisture had an influential bearing upon the temperature existing under the different systems of soil management. She temperature range varies inversely with the amount of mulch covering the soil. The role of soil temperature within the limits of ordinary cultural practice appears to be a neutral factor in tree growth in Indiana.

From a study of the chemical changes induced in the Laurel soil by cultural practices during the period 1910 to 19.5, it appears that clean cultivation tends to deplete the soil of its organic matter, despite the fact that a cover crop is being turned under each year. The straw mulch plot has increased slightly in organic matter, while the sod plots have, as a whole, come nearer to holding their own in volatile matter, humus and nitrogen, than the clean culture cover crop plots. There is no apparent correlation between the previously mentioned chemical factors and tree growth.

A study of the average bacterial population shows that the are, in most cases, more bacteria present in the sod ground at Laurel than in the clean culture cover crop plots; that the variations in mulch on the sod plots have some influence on bacterial numbers; that tree growth and soil moisture cannot be correlated with bacterial numbers.

Tests show that ammonification varies with the season. Differences between plots are not consistent with seasonal climatic variations, and it is impossible to say that cultural practice has affected the ammonifying power of this soil. Tests show that nitrification varies with the season, but that a growing crop of grass or rye lowers the nitrate content of the soil; that the most nitrates are found unde rthe clean culture cover crop system, the straw mulch ranking second in amount of nitrates; that the girth gains of the trees are roughly proportional to the nitrate content of the soil; that there is no relation between the nitrifying power of the soil and either cultural practice or tree growth; however, the ratio between the nitrates present in the field and the nitrifying powr of the soil does bear a relation to tree growth. —H. A. Noyes and Joseph Oskamp in Purdue University Agricultural Experiment Station Bulletin.

AMOUNT OF WATER COW NEEDS

What effect has the amount of water a cow drinks on the percentage of butterfat in the milk she produces? —E. B.

Reply. — Experiments have proved that the quantity of water drunk by dairy cow shas nothing to do with the composition of the milk. When the cows are permitted to have an abundance of water, there is a very noticeable increase in the amount of milk given, and consequently in the amount of butterfa, but the butterfat test of the milk is not affected.

It can be said that water is the most importan part of the dairy cow's ration. Without it, other food would be valueless. Its usefulness is twofold, being absolutely necessary for both maintenance of the body and the secretion of milk. Water is needed in the making of blood, and also the various glandular secretions of the body, particularly those that assist in digestion.

The digestive tract must be flushed, and water accomplishes this purpose. It also serves as a medium by which the waste matter and poisons of the system can be expelled and the nutrients from digested food carried to different parts of the body. It aids directly in digestion, in that it permits the maintenance of sufficient moisture in the stomach so that the food can be dissolved, more easily digested, and more readily assimilated.

The cow seems to have the ability to draw her body moisture for these purposes, but if water is witheld from her for any length of time and she has none to replace what has been used, it is inevitable that she become incapable of digestion, and that she rapidly become poor in co dition.

The amount of water a cow shou have depends entirely on her ne This is best determined by the co hrself. whether she gets her wa from her individual drinking cup from a common drinking trough.

Cows consuming great amounts feed, particularly of high protein co tent, wil drink more water than tho on light feed or good pasture. Co fed succulent feeds will not drink much wate ras those getting only d feed. There is a perfectly natu tendency to drink water in an effo to make feed more palatable and

A smart boot which is a great favorite with women who prefer the long vamp medium-narrow toe and slender Spanish heel. Choice of several grades and varieties of leather.

How to Buy Shoes

THERE are many things which you need not buy unless you choose. But footwear is not one of them. You must have shoes. And the problem of buying shoes is one which comes home to every man and every woman in Canada.

In order to help you solve this problem, we have prepared a booklet with the title given above. We believe that you will find it helpful and interesting, whether you buy A.H.M. Shoes or not. And it is not necessary to buy A.H.M. Shoes in order to profit by the information which is contained in it.

We are glad to send a copy with our compliments to any address in Canada. Please send your request to our Head Office, at Montreal.

provide the succulence that dry feed lacks.

Water, like feed nutrients, is utilized up to a certain point in maintenance of the body. Beyond that point it takes a very important place in the ration as a direct aid to digestion. Cows on full flow of milk must have an abundance of water at frequent intervals or they cannot maintain production. In experimental work it has been found both the amount of water and the frequency of giving it made considerable difference in the milk flow. In one experiment it was found that whei the cow was supplied with only one-half of the amount of water she would ordinarily drink, there was a daily decrease in the amount of milk of about one-fourth. Toward the end of the 30-day experimental period the decrease was more nticeable. It is statd that if the cow had been continued on this one-half ration of water she would, undoubtedly, have gradually decreased in milk flow until entirely dry.

During cold weather it is absolutely essential that some means be provided for heating the water so that the cows may not be forced to drink ice water. When cows drink water at a low temperature, particularly when they gorge themselves after being forced to do without for a length of time, the temperature of the body is lowered during a greater part of the period of digestion. Therefore, as can be seen, the normal functions of the body are impaired when cows are forced to drink water at too low a temperature. Only when cows have contiuous access to water in the barn as provided by water basins is it unnecessary to heat it during cold weather.

SHORTHORNS FOR CROSS-BREEDING

The value of the Shorthorn for crossing on other breeds is well-known, and a large proportion of prize-winning steers in the selections for grades and crosses at our leading shows, carry Shorthorn blood in their veins.

Crossing the Hereford and Shorthorn has produced some of the most noted herds in the Panhandle country of Texas. (See "Shorthorn Cattle", by Sanders).

Perhaps the most noted cross is that of the Shorthorn with the black polled cattle of Scotland, the result being the so-called "prime Scots", which have been favorites for a great many years with both farmers and butchers in Great Britain. This cross has a growthiness and readiness to fatten which pleases the cattle feeder and swells his bank account. No other breed has proven equal to the Shorthorn for crossing with the Angus and Galloway.

Unfortunately for the Shorthorn, it does not stamp its colour upon its progeny when crossed with other breeds to the extent that the Hereford, Aberdeen-Angus, and Galloway impress their colour. In this way the Shorthorn loses a great deal of the credit which is its due, when crossbreds are upon exhibition. For example, at the 1918 International Exhibition in Chicago, the Grand Champion carload were advertised as Hereford, because they had the Hereford colour, but they carried a strong infusion of Shorthorn blood, which was a decided advantage to them in winning premier honours. Also, the group of three steers winning first in the grade and crossbred specials, were black and hornless, but their sire was a Shorthorn bull, and they owed much of their excellence to this fact.

Though he is not a good advertiser from the standpoint of transmitting his colour, the Shorthorn bull transmits the excellent qualities of the breed to a marked degree, and effects improvement wherever he is used.

Canadian Candy and Chocolate

IN recent years, it has been demonstrated to the world that in most lines of manufacture the Canadian product is equal to, and in many, superior to foreign-made goods.

In the manufacture of candy and chocolate, Canada is at the top. The Pure Food Laws guarantee a wholesome product, while skill in manufacture has produced a quality and deliciousness unequalled in any country.

Within the last few months a tremendous demand for Canadian candy and chocolate has grown up in England and Europe. The large supplies sent to our men overseas during the war gave to many Europeans their first opportunity of appreciating the high qualities which the Canadian product possesses. European merchants and candy lovers are now clamoring for Canadian candies.

There may be some Canadians who do not realize that the most wholesome and delicious candy and chocolate are made here at home—but this is true.

You can eat Canadian-made candy and chocolate with assurance of their high quality and wholesomeness.

Candy and Chocolate Made in Canada.
The Best.
They are Splendid Food.

HINTS FOR MOTORISTS

by ALBERT L. CLOUGH — Editor Motor Service Bureau Review of Reviews...

HOW THE ELECTRIC GENRATOR WORKS

Following is a brief explanation of how the eelctrical generator produces its current and how this current is regulated to a nearly constant value, despite variations in engine speed. The generator is merely a small dynamo, with a wire wound, rotating part (the armature), having a cummutator at one end upon which bear two brushes that collect the current generated. Encricling the armature is a stationary, wire wound, soft iron frame, the inward projections of which (the pole pieces) are located very close to the armature. When this field frame is magnetized and the armature is rotated, current is generated in the latter. It is magnetized by current passing through the wire coils about it, which current is derived from the armature. The principal magnetizing coil is the fine wire shuntcoil, from one main brush to the other around the field frame. The faster the engine turns the armature, the more current passes through this and the more this current is increased the stronger becomes the field magnetism and the electrical pressure (voltage) suplied by the generator. If this shunt coil only were allowed to act uninterruptedly, the current sent to the battery would increase with engine speed, so that in very fast driving, the charging current would become so great as to prove destructive to the battery and possibly to burn out the lights anad perhaps the generator itself. The situation is that the current supplied by the generator increases not only with increasing engine speed, but also with increasing magnetism, itself due to higher speed with these undesirable results, which must be checked. Since it is hardly practicable to keep the generaor speed constant, it is necessary to diminish the magnetizing effect of the shunt coil very greatly as speed increases and this is done by arranging that the shunt coil shall act, at full power, a less part of the time as the speed increases. To effect this, a magnetic relay, under control of the current sent to the battery, is arranged to introduce into the shunt field circuit a resistance, wherever the battery current becomes excessive, thus weakening the magnetism and to withdraw this resistance when the charging current becomes too small. The higher the speed, the more of the time the magnetism is kept weak and th current is thus kept substantially constant This is only one of the ways of regulating generator output. Others will be referred to later.

RUNNING STARTER AND LIGHTS WITHOUT GENERATOR

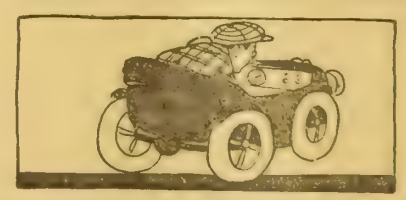
L. writes: The electric generator on my car they tell me must be sent to the factory for rewinding and the job will require several weeks. Please advise me if it is possible to keep the starter and lights working from the battery, while the generator is out of service.

Answer: Yes. You can have the battery charged from an external source of current at night or whenever the car is not in use or the battery may be removed and left at a charging station, when a test of the electrolyte indicates that it is nearing discharge, and the charging station will furnish you a fully charged battery to put in its place, for the use of which a moderate rental will be asked. By thus changing batteries you will be able to get along very comfortably, especially if you use the starter and lights rather moderately. By cranking the car by hand, relying upon the battery for lights and igni, tion only, a single battery charge will lats you quite a long time. If you charge your battery yourself, you will need a rectifier—a piece of apparatus which every motorist may well own.

NO OIL PRESSURE IS INDICATED

J. P. S.: A few mornings ago, when starting out with my car, I noticed that the hand of the oil pressure gauge would not move, no matter how much the engine was speeded up. This made me afraid to use the car and I put it back in the garage and have not used it since. Please tell me as soon as possible, what the trouble is, as I live far from any garage.

Answer: .You were wise to discon-



tinue using your car, as you might otherwise have seriously injured your engine. We do not know the construction of your engine's lubrication system, but the trouble may be lack of oil (although the gauge may be deranged and indicates "full"); the cloggging with dirt of the oil strainer, so that the pump cannot fill or its obstruction by ice formed from water accidently present in the oil; the failure of the oil pump to act, due to its having frozen anad broken or from some other cauase; the disconnection of the oil pipe between the gauge and the crank case deilveries.

PNEUMATIC TIRES ON HEAVY TRUCKS

Until quite recently it has generally been assumed that the heavy commercial car must necessarily be equipped with solid rubber tires, but recent advances in the tire art have led to the production of pneumatics of enormous size, adequate to support the weight of large capacity trucks and it appears that these tires are capable of giving economic results favorable enough to challenge the supremacy of the solid tire in certain branches of the trucking field at least. The more resilient the tire, the higher the permissible speed for a truck may be and the higher its speed the more paying work may be gotten out of it. These giant pneumatics of cord construction are highly resilient in comparison with solid tires, allow of greatly increased truck speeds without causing vibration detrimental to the mechanism or its load and carry their loads with very moderate heating, which means the fuel consumption is reduced by their use. War-time transportation conditions have given a pronounced impetus to long haul, intercity motor trucking, in which speed is an important consideration, and this has brought into prominence these giant pneumatics up to nine inches in diameter. Under conditions where high speed is a desideratum as in the transportation of valuable, perishablo freight or rush orders of any kind of merchandise there is reas on believe that the pneumatic truck will become a regular feature in the modern system of transportation.

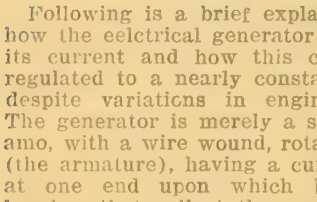
Make Your Ford Ride Like a Limousine

YOU cannot put any accessory on your Ford car that will add more to your pleasure and convenience in riding, or save more wear and tear on the car itself, than a set of

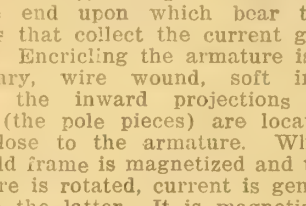
H&D AITCHANDEE SHOCK ABSORBERS

"Make Rough Roads Smooth"

This is the original cantilever-principle type, protected by Canadian Patent 172892—the logical shock-absorber for Ford cars. Easy to attach. No holes to bore. Weight per set, 20 lbs.



Single Arm Type, Set of Four **$10**



Twin Arm Type, Set of Four **$12**

These will save your springs; lengthen the life of your tires; increase your comfort in riding and earn their cost in a season. Over 200,000 in use to-day. Remit by Money Order or Postal Note. Use them for 30 days, then if not satisfied with your purchase, send them back and we'll refund your money.

MALTESE CROSS TIRES

We don't like to call a tire "tough" but it is the only word which explains the fact that it takes so much mileage to wear out a Paragon Tread Tire. Toughness in tires is a virtue which is manifested to a marked degree in the Maltese Cross Brands.

Maltese Cross Paragon Tread

PARAGON TREAD

The Paragon Tread, black with grey side-walls, has a neat, well-finished and substantial look, which adds something desirable to the appearance of any car.

GUTTA PERCHA & RUBBER, Limited
Head Offices and Factory, TORONTO.

BRANCHES:—Halifax, Montreal, Ottawa, Toronto, Ft. William, Winnipeg, Regina, Saskatoon, Lethbridge, Calgary, Edmonton, Vancouver, Victoria.

TOO HIGH VOLTAGE SYSTEM

L. A. D. writes: The lights on my car are altogether too bright and they burn out so soon that it puts me to considerable expense. Other users of similar cars seem not to have this trouble. Can you tell me what is wrong?

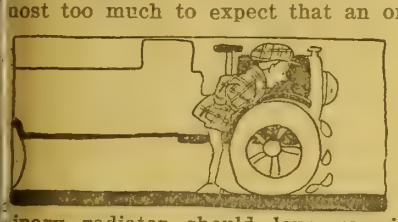
Answer: Assuming that you are using lamps of the voltage specified by the makers of your car, the most likely explanation is that your system is constantly at too high electrical

pressure, due to the habitual overcharging of the battery which, in turn, is attributable to the charging rate of your generator being higher than the circumstances warrant. If your battery is constantly gassing, when charging is going on, becomes very hot after long runs and requires lots of water to keep the cells full, this probably is the correct explanation and we advise you to take your car to the station and have the generator's charging rate lowered.

TRUCK RADIATOR WON'T STAY TIGHT

B. & J. writes: We are operating a Ford delivery, which was built from a passenger car engine and a truck converting unit and have constant trouble with radiators, which develop leaks soon after they are put on. Can you think of anything that will prevent this

Answer: We wonder if your are using pneumatic or solid tires on the front wheels. If the latter, it is almost too much to expect that an or-

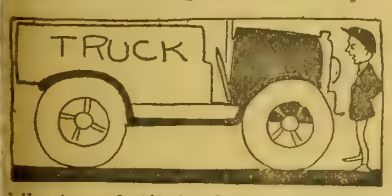


dinary radiator should long remain tight, under the severe jarring necessarily occcurring. Leather shims, between the bottom of the radiator and its support, may be of some value in mitigating the stresses that result in producing leaks and a suitable adjust ment of the stay-rod from the radiator top to the dash is of importance. We think that you can obtain a truck type of radiator, of more rugged construction, which will fit in place of the standard type.

IMPULSE MAGNETO

The B. L. Co writes: We have a truck the engine of which is very hard to start as it has large cylinders and a magneto only for ignition. Moreover it is kept out of doors nearly all the time. It is more than an ordinary man can do to spin the engine, at starting, fast enough to get a good spark. Have you any suggestions?

Answer: It might be worth your



while to substitute for your present magneto, a so-called impulse magneto. In this type a full powered spark is produced, at the correct instant, no matter how slowly the engine is cranked—the actual movement of generating the current being produced by the sudden release of a spring, which has been compressed by the cranking action. Almost any dealer, who is conversant with magnetos, can obtain one of these for you.

Lubrication Very Important

Are you giving your Automobile, Stationary Engine, Tractor and other farm machines the proper lubrication attention? All of these must be correctly lubricated if they are to give you the kind and length of service that they should give.

Imperial Farm Lubricants are well known to Canadian farmers. If you are using an Imperial Oil brand, you cannot find a better lubricant—but it is possible that the way you use Imperial Lubricants can be improved. Note recommendations below. We have the right lubricant for each purpose and it is only by using the right one that results may be secured.

HANDY SIZES

Imperial Lubricants are supplied in one half, one and four gallon sealed cans; half barrels and barrels. There is a stock of Imperial Lubricants conveniently near you.

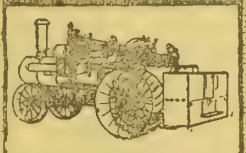
IMPERIAL OIL SERVICE

If you need advice on lubrication ask the *Imperial Oil man.* He knows the subject from every standpoint—knows the right oil for each farm machine. Exceptionally difficult problems will be referred to Imperial Engineers, without charge.

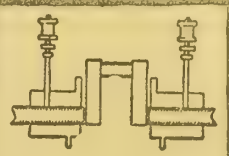
A Correct Lubricant for every Farm Machine

For Gasoline Engines, Tractor, Auto or Stationary
POLARINE OIL
STANDARD GAS ENGINE OIL
For Kerosene Engines Tractor or Stationary
POLARINE OIL HEAVY
POLARINE OIL A
IMPERIAL KEROSENE TRACTOR OIL
IMPERIAL KEROSENE TRACTOR OIL EXTRA HEAVY
(Recommended by many tractor manufacturers)

For Open Bearings of Farm Machinery
PRAIRIE HARVESTER OIL
—very heavy body, resists cold, won't thin out with moisture
ELDORADO CASTOR OIL
—a thick oil for worn and loose bearings



For Steam Cylinder Lubrication, whether Tractor or Stationary Type.
CAPITOL CYLINDER OIL
—the standard product for steam cylinder lubrication



THRESHER HARD OIL
For Grease Cup Lubrication of Bearings, a clean solidified oil high melting point.

IMPERIAL OIL LIMITED

EXAMINING FROZEN ENGINE FOR DAMAGE

J. writes: During a recent cold spell, my engine sustained a bad "freeze up" and I haven't used it since. I know that the radiator has burst in several places. How can I tell whether the cylinders were injured?

Answer: We assume that your engine has already been fully thawed out and that the radiator has been re-

paired so that it holds water. If you fill the cooling system as usual and water escapes through the cylinder jacket walls, this is likely to be through cracks produced by freeezing which cracks can be closed by welding. In case, however, water is found in the crank case oil, after the engine has stood for some time, or if air can be heard bubbling through the jackets, when the engine is hand-cranked, it may indicate that there is a crack in a cylinder wall, which is a pretty serious matter. A crack in the combustion space walls in the head, will have the same effect and so will a leaky head gasket. If you close the water outlet from the cylinders and apply hydrant water pressure to the water inlet, you will soon ascertain whether anything has been burst, by watching for the external leaks and escapes of water into the crank case. The leak, if any, may be in the head casting for the block or there may be leaks in both.

REPAIRING A SCORED CYLINDER

W. S. asks: If a cylinder has been scored, so that a piston cannot be fitted tghtly in it, is there any possible remedy except reboring it and the rest of the cylinders?

Answer: There are several processes in use in repairing "scores" without enlarging the cylinder bore, which depend upon replacing the metal that has been worn away by means of alloy electrically welded in place or deposited electrolytically. After this is done, the repaired portion is ground true with the rest of the bore. If a cylinder is all right, with the exception of a definite score, such as made by a displaced wrist pin, such a repair as this, if successful, permits the use of the old piston and obviates the necessity of doing anything to the rest of the cylinders.

FORD STARTER FOR OLD MODELS

J. H. M.: I own a 1916 Ford and am anxious to know whether the electric starter that is being furnished for the 1919's can be obtained for attachment to my car. Can you tell me as to this?

Answer: We understand that this will depend on whether the output of these starting and lighting outfits can be made more than sufficient to take care of the new cars which are being put out. If it can; we are informed that the surplus will be available for installation on cars of older models.

GIVING THE FUEL SYSTEM "THE ONCE OVER"

The principal requirements for the successful action of the fuel system are that it shall be kept tight and free from obstructions and foreign matter. Assuming a rear tank vacuum feed system, the following suggestions are offered. Draw off liquid from the rear tank settling-pocket into a glass bottle and see if any water or sediment is present, rocking the car meanwhile. Keep drawing off samples until only perfectly clean gasolin comes out. See that the gasoline pipe connection is perfectly tight, that the gauge operates freely and correctly and that the filler cap makes a perfect seat that its vent hole is unobstructed. If possible, follow the gasoline pipe along to the vacuum tank, making sure that it is securely clipped in place. Uncouple the feed pipe of the vacuum tank and clean the strainer, which is usually found there, replacing the union with care. Collect a little gasoline in a bottle from the draw-off at the bottom of the vacuum tank and, if it is not perfectly clean, collect samples until you secure a perfectly pure one. See that the gasoline connection at the bottom of the tank is perfectly tight. If the pipe is wet it probably leaks and ordinary soap on the union faces will tend to make it tight Try the unions on the suction pipe from the tank to the manifold, to make sure they do not leak. With the gasoline turned on, wipe the bottom of the carburetor clean and inspect it again after an hour or so . If it is wet, the float valve leaks or the fuel level is above the spraying outlet and adjustment or replacements parts is required. If there is a screen at the point of entrance of fuel to the carbuetor, clean it and, in replacing the union connection, wipe it clean and see that it does not later become wet. In case there is a draw-off at the bottom of the carburetor bowl, open it and allow gasoline to flush through it until it comes perfectly clean. Also try the bolts that hold the carbuetor flange to the flanged intake opening, to insure that they are tight enough to prevent any air leak.

GAS CONSUMPTION INQUIRY

S. writes: Drivers of Ford cars often tell me that they get from 18 to 24 miles on a gallon of gasoline and some of these statements I believe are true, but I cannot average better than 12 miles to the gallon in the regular running of my Ford, which I use for delivering milk to my customers. Shouldn't I do better than this?

Answer: You cannot expect very high gasoline mileage because you doubtless idle your engine a good deal and use up considerable fuel in

starting your car at each stopping point. The power expended in acceleration is, of course, lost, when the brakes are applied at the next stopping point, which may be only a short distance away. High fuel economy records are made in cases where long distances are uninterruptedly covered at speed and the mixture is run as lean as possible, with the engine fully heated up. Operators use the dash carbuetor adjustment too little and in most instances a leaner mixture than is customarily used could be successfully employed a good part of the time. Perhaps you can help matters somewhat by attention to this point, but we fear that you are doing nearly as well as you can expect to.

CARE OF THE TOOL EQUIPMENT

A very fair kit of tools is usually furnished with every new car that is bought, but in too many cases these tools are soon lost or broken and, when an emergency arises, the very one that is essential is found to be missing. When tools are used upon the road, it is very easy to leave them on the ground or upon the running boards or fenders and, in the hurry of the moment, to drive away and leave them or to scatter them along the highway. It is best to take an account of stock each time that the equipment is used in this way. Many tools are bent or broken by using them in prying or pounding operations, for which they were not intended, such as in changing tires. A hammer is provided for hammering and it is better adapted for this purpose than is a wrench or the pliers. Small weak screwdrivers and hardened tools such as punches and files, will not serve well as levers. tI is very easy to ruin a small monkey wrench or Stillson by using it on heavy work, when one is horried and nervous and it only takes a few seconds to get a suitable tool. Small tools should never be left where they can fall into an open housing. They fall in easily and some times it is almost impossible to extricate them from such places, where their presence may cause extensive damage. If tools are carelessly allowed to touch electrical connections, it may mean a run down battery.

DANGER OF BATTERY FREEZING

A. G. writes: I have just bought a car and have only an unheated stable to keep it in. Is there any danger of the battery's freezing, in such a place?

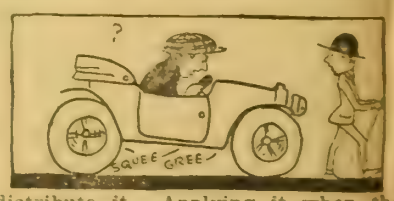
Answer: There is no danger, if you keep your battery fully charged and there is serios danger, if you do not. For information as to the state of charge of your battery you will have to depend upon hydrometer read-

ings of gravity of the solution in each cell, taken fairly often. At full charge, the gravity should be at least 1275 and freezing of such a solution wil lnot take place at any temperature ever reached, indoors, in this country. The electrolyte in an entirely discharged battery will freeze at somewhere about 15 degrees Fahrenheit above zero, a temperature which any unhated garage may reach in sever weather.

CAUSE OF SQUEAKING BRAKES

Q asks: What makes the brakes of my car squeag so horribly when it is being brought to a stop?

Answer: Probably, because the lining material has become glazed over. so that it acts upon the brake drum as a rosined bow does on a violin string. The band linings require a little lubrication, just enough to prevent a perfectly dry contact and to soften the surface of the material somewhat. A little linseed oil, with considerable kerosene mixed with it. is considered good for this purpose It can be sparingly applied to the drums and the wheels then turned by hand, with the brakes set gently, to



distribute it. Applying it when the car is garaged at night is a good idea, as it will be disrtibuted by morning and will not interfere with brake action. In case the linings are so badly worn that the rivets securing them to the bands rub harshly upon the drums, there will most likely be a squeak produced which con only be prevented by countersinking the rivets.

GEAR LUBRICANT INQUIRY

J. A. S. asks: Is it safe to use the various gear box compounds, which are advertised to stop the noise? If not, what is the best thing to use?

Answer: Some of these compounds

may contain ground cork, tar, boxwood sawdust, mica or very impure graphite, which substances, among others, are likely to damage ball bearings seriously. Moreover, if they contain excessive proportion of unstable animal fats, they are likely to corrode the bearing parts. Some of the noise deadening compounds are so sticky that they absorb altogether too much power. Undoubtedly there are many special gear preparations that

are perfectly safe, but there is probably no better lubricant to use in a gear case than a heavy, high grade steam cylinder oil. If found to be too thick, it can be thinned with light oil and in case it proves too thin, high grade grease can be added to it. When gear noise cannot be kept within bounds, by the use of such a lubricant, the gears and gear shafts doubtless require attentoin.

DON'T IGNORE THE INDICATING DEVICES. — DISREGARDING OF DANGER SIGNALS LEADS TO TROUBLE

Watching the road and the traffic upon it is the chief duty of the motor car operator, but it is also of importance that certain things about his car itself should be watched while on the road. These are indicating devices, which are provided as safeguards and while it is not necessary that they be constantly consulted, it is essential that they should be glanced at, at fairly short intervals. The well being of the engine depends absolutely upon the adequacy and constancy with which it is lubricated and the presence of a flow of oil in the oil indicator or the existence of the reuiqred pressure at the oil gauge, should be frequently verified. Any lack of circulation or pressure should infallibly be the sigoal fnr stopping the engine and correcting the trouble before proceeding. When a stop is made, after a long run, the crank case oil-gauge deserves a glance in order to guard against the level becoming low and the gasoline gauge may be well consulted lest the fuel supply become too far depleted. An occasional look at the charging indicator (ammeter) of the electrical system is a wise precaution against exhaustion of the battery. Unless it shows the full normal charging current, in the day time, it is evidence that lights have accidently been switched on, that there is some unusual escape of current or that the generator is not doing its duty. If there is anything unusual about the amount of current indicated at any time, the cause had better be determined and removed. For instance, if no charging current passes, when the car is at speed, the generator may be active but not connected wit hthe battery and may burn itself out as well as let the battery run down. Attention to the radiator thermometer at rather frequent inetrvals is desirable. If it found to run too high this may prove a timely warning of insufficient water in the radiator, insufficient engine oil supply, a broken or detached fan belt or something else which either throws excessive duty upon the cooling system or lessens its capacity for getting rid of surplus heat. Every motorist should realize what abnormal indications of these instruments mean and that the failure to notice and act intelligently upon such indications may result in inconveniena delays upon the road and serious damage to car mechanism. These indicators are important enough to be taken seriously and not to be ignored as many careless drivers too often do.

The Light Six— A GENUINE McLAUGHLIN CAR

McLAUGHLIN MOTOR CARS

The McLaughlin trade mark is a guarantee of efficiency in the mechanism and quality in the material and workmanship. The McLaughlin LIGHT SIX stands up to every test and cuts down the cost of motoring. Many owners of this model get over 30 miles per gallon from gasoline and eight to ten thousand miles on tires is not unusual.

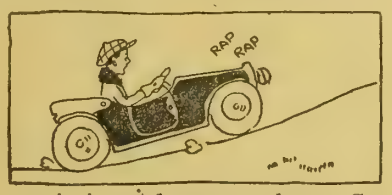
TROUBLE WITH AUTOMATIC SPARK ADVANCE

D. A. G. writes: My engine has a most elusive knock, which sometimes does not "show up" for days at a time and again occurs quite frequently. It generally troubles me when the car is climbing a hard hill on high, but often it will take the same hill perfectly smoothly. It sounds like a knock from too much spark, but my car has an automatic arrangement, which keeps the spark right. The cylinders have been cleaned and



the engin is not loose anywhere. Can you explain this?

Answer: Your statement that your engine has an automatic spark advance, raises the possibility that this may be operating defectively, for it sometimes happens that, during high speed operation, the advance mechanism sets the spark very early and that it fails to return to a suitable retarded position to keep the engine from knocking, when it is doing severe hill climbing, at low speed. Lack of lubricants is sometimes responsible for such a failure and we suggest that you have the mechanism examined to see if there is any likelihhod trat it may occasionally stick in an overadvanced position.

IS THIS BATTERY SHORT-CIRCUITED?

H. W. G. writes: I have had so much trouble from my battery becoming discharged, that I am beginning to think that there is some loss

of current from it, caused by something wrong in the system. How can I find out this?

Answer: With ignition and lighting switches turned off and the starter not in use, no current should be delivered by the battery and there should be no sign of a spark, when the cable connected to the live terminal of the battery is detached therefrom and no indication produced in an ammeter connected to this cable end and battery terminal. The charging indicator should show the proper amperage of "discharge" current, when all lights are burning, with the engine stopped, and the expected value of "charge" current when lights are on and the engine running at speed. If your electrical system stands these tests, there is no abnormal external drain upon your battery, but it is quite likely that it is internally short-circuited.

HINTS THAT WILL HELP

Gather the eggs daily and try to get them in to market twice a week. The life of a fresh egg is three days. One bad egg may lose a valuable customer; send all "doubtful" eggs to your own kitchen. Each day date the eggs laid, so that the age can be guaranteed.

Cut Dairy Costs

THOUSANDS of dairymen are using Empire Milking Machines to cut dairy costs. Many write us they would have to go out of the dairy business if it were not for

EMPIRE MILKING MACHINES

And it's true, too. You have no idea what a saving in time and increase in milk production results from the use of such a highly perfected and universally successful milker as the Empire.

And now, with its Super-Simple Pulsator—the pulsator without a piston—the Empire is placed immeasurably ahead of any other milker on the market. Buy no milker until you see the Empire.

Let us send you the details. Write for catalog No. 26 Or, better yet, let us have our local dealer demonstrate for you. No obligation. Write for his name.

POTATO GRADING AND ITS RELATION TO MARKET PRICES, TRANSPORTATION AND CONSUMPTION

(Continued from page 759)

advised greater potato consumption. The best way to increase consumption is by putting a better graded potato on the market. We must eliminate waste. When we sell a grocer or a consumer a hundred pounds or a peck of potatoes, they should be 100% marketable. We must show the consumer that we have a good article for sale, an article of food which will show very little waste. When a customer buys a hundred pounds of flour he buys practically no waste. When he buys a barrel of No. 1 Ontario apples he buys practically no waste. When he buys a barrel of New Brunswick potatoes he gets all the way from 10 to 25% waste. This is not conducive to greater consumption, and if we expect to enlarge the potato industry of New Brunswick, we must get at in a practical way and eliminate waste to the consumer who puts up the money. We must grade our potatoes and make them 100% merchantable. Thirty years ago the apple growers in Ontario shipped their apples in box cars in bulk, and shovelled them up with forks and shovels. The usual price was $1.00 per barrel at shipping point. A certain farmer in Ontario conceived the idea that he could get a better price by grading his apples and packing them properly. The Ontrio farmers today grade and pack their apples according to quality and size. They are sold at No. 1's, 2's and 3's and bring almost three times the price they did when sold in bulk. We are today in the same position as the Ontario apple grower was thirty years ago. The waste every year from not having a standard of quality, and grading regulations is criminal. Our potato crop is not bringing more than 50% of its real value. Neither are we getting more than 50% of the consumption we should have, simply because we have no standard of quality and no compulsory grading regulations. If we had compulsory grading regulations and a standrd of quality to live up to, backed up by organized control, either Government or Association, it would be but a short time before 85% of our entire crop would be grade No. 1. The farmers would recognize that bruised and small potatoes would not sell to advantage and would take more car in handling their crop. Each farmer would do his best to market his crop under No. 1 classification, and in a short time New Brunswick potatoes would be known in the markets of the world as No. 1 Graded Stock. If compulsory grading was carried out and a standard of quality fixed, so as to hold the confidence of the buyer and consumer, we would increase our consumption I believe, 50%. This would be a great stimulent to the industry. The crop would bring hundreds of thousands of dollars more every year to the farmers of this Province. The value of New Brunswick farms would increase. We would get less competition from other potato growing Provinces. The potato would soon be the most important crop of the Province and New Brunswick wuld soon grow in prominence on the map of North America.

We must grade and stock our potatoes to a uniform standard of quality, so that we will have the best to offer on any market that requires our goods. With the transportation facilities soon becoming normal again, we could be working into new markets for our potatoes. It would be a sad day for New Brunswick to ship the ordinary run of potatoes to a new market and have the importers pass judgment on our quality and grading as it stands today.

Something must be done, and at once, if we are to hold the high place in the potato industry of Canada, that New Brunswick deserves, and I strongly recommend the establishment of standard Grading Regulations, similar to the Grading Regulations now in use in the United States and that these Grading Regulations be made compulsory by Federal Legislation. I also recommend that an Inspection Service be put into effect similar to the one now used in the United States that an Certificate of Inspection be furnished to all shippers when requested, and that this Certificate be receivable in all Courts of Canada and the United States as prima facie evidence of the truth of the statements contained therein. You would then be able to sell potatoes as you now sell wheat and apples and furnish a certificate of inspection, to convince the buyer that he is getting what he is paying his good money for. Such a system, I believe, could be worked out easily, and would be of great advantage in holding the confidence of the buyers of New Brunswick potatoes in all markets.

"HOMESTEAD LIQUID RED"
FOR BARN AND SILO

These are the most valuable buildings on the farm. Think what it would cost to replace them!

It's cheaper to paint than to repair—and "HOMESTEAD LIQUID RED" will protect the farm buildings against the ravages of climate and weather.

Give the buildings a coat or two of this reliable paint—rich in color, permanent and durable—because of the high-grade oils and pigments used, and the thorough grinding of ingredients in the oils.

Our book, "What, When and How To Paint" tells all about CANADA PAINT for the house—SANITONE for walls—and "SUN" VARNISH STAINS for floors, furniture, etc. Write for a copy.

STANDARDIZATION OF FARM MACHINERY

(Continued from page 758)

the farmers believe that the particular machine they sell is better than that of any other make.

While the present agitation is only for standardization of machines and the elimination of unnecessary machines, that imitate other makes, together with the repairs (that is the breakable and wearable parts) no doubt in the near future farmres and others will insist on a lessening cost of machinery, wagons, motors, etc., by having one agent seling over a certain teritory for standard makes, not dozens of agents going over the same ground piling up the cost of overhead in the way of hotel, autos and salary.

It used to be said that it cost as much to sell certain machines as it did to manufacture them. Whether this be true or not, now that machinery and implements are costing from 30 to 60% more than in pre-war years every effort must be put forth by those who have to purchase to see that costs are reduced by lessening the selling costs.

Possibly the time has come for making this more general, to include wire fencing, fertilizers and several other lines of goods the farmer is paying too much for, owing to patent rights, agents' salaries, expenses and commissions. A multiplicity of ogents is claiming a lot of hard earned tarmers' money.

In February, 1918, this matter was brought before the Manitoba Agricultural Societies at Winnipeg by J. Lockie Wilson, Sec'y of Agricultural Societies for Ontario, and a resolution was introduced and unanimously carried by the convention asking the Federal Government to take immediate

WAS WEAK
ALL RUN DOWN
FROM HEART and NERVES.

Mrs. Percy G. McLaughlin, Lawrence Station, N.B., writes:—"I am writing to tell you that I have used Milburn's Heart and Nerve Pills, and find since I commenced to use them that I feel altogether a different woman. I was weak and run down from my heart and nerves, and was recommended to try your pills by Mr. James H. Scott who has taken them, and says if it were not for them he could not live. When I finish the box I am now taking I will be completely cured. I wish to thank you for putting up such a wonderful medicine, and I will gladly recommend it to one and all."

To all those who suffer in any way from their heart or nerves, Milburn's Heart and Nerve Pills will come as a great boon. They strengthen and stimulate the weak heart to pump pure, rich, red blood to all parts of the body, strengthen the shattered nerves, and bring a feeling of contentment over the whole body.

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Such were the themes dealt with. The letters fell on fertile soil. The truths set forth were seized and acted upon and Nova Scotia soon began to bread herself—the monies hitherto going to the United States for bread were retained at home and agriculture boomed.

"Agricola," the man of vision, has passed to the great beyond but the good he accomplished lives an and on and this, the centennial of the appearance of his letters ,is a fitting time for the erection of a suitable memorial that will perpetuate his name in the annals of Nova Scotia's hisitory.

1919 SPRAY CALENDAR FOR NEW BRUNSWICK APPLE ORCHARDS

G. E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, Nova Scotia.
A. G. Turney, Provincial Horticulturist, Fredericton, New Brunswick

This Cancels All Previous Recommendations for New Brunswick

First Srpay

Time.—About five days before the blossoms open.

Material. — Poisoned Bordeauax made up of 3 lbs. bluestone, 10 lbs. of either water slaked stone lime or hydrated lime, and 1½ lbs. arsenate of lime to 40 galons of water.

Applicatoin. — Drench thoroughly, spraying in every direction.

Pests destroyed.—Bud Moth, Fruit Worm, Canker Worm, Apple Scab.

Second Spray

Time.—Immediately after the blossoms fall.

Material.—First choice, lime sulphur, 1.006 sp. gr, equal to 1 gal. commercial strength to 50 gal. water or 4/5 of 1 gal. to 40 of water, adding slightly less than ¾ lb. of arsenate of lime and 5 lbs. hydrated lime or water slaked stone lime to 40 gallons.

Second choice, soluble sulphur, 1 lb. arsenate of lime ½ lb. and water slaked or hydrated lime 5 lbs. to 40 gal. water.

Application.—In using lime sulphur for this spray try not to wet the under side of the leaves. Direct the lime sulphur spray downwards. Soluble sulphur may be safely sparyed in all directions.

Pests destroyed. — Coddling Moth, Bud Moth, Apple Scab, Pit, Tussock Moth.

Third Spray

Time.—Two weeks after the blossoms fall.

Material.—Poisoned Bordeaux made up of 3 lbs. bluestone, 10 lbs. hydrated or water slaked stone lime and 1 lb. of arsenate or lime to 40 galons water.

Aplication. — Drench thoroughly, spraying in every direction, as this is the last spray of the season.

Pests destroyed.—Apple Scab, Pit, Tussock Moth.

Fourth Spray

On varieties very susceptible to apple scab, such as McIntosh and Fameuse, the fourth spray is necessary to prevent the late summer infection. The best tim to apply this spray has not been definitely worked out but is probably about the end of July or the beginning of August. Watch the foilage and fruit closely for the first developments of scab and apply this spray accordingly. Use poisoned Bordeaux made up of two lbs. of blue-

(Continued on page 791)

Haying Waits For No Man

TO GUARD against possible loss be prepared to mow, rake, ted and load your crop from hayfield or meadow at the proper moment.

For years you have been cheerfully complying with Government request to save materials by repairing your old machines rather than making replacements. Now that the need for this has passed, would it not be real economy to buy new machines and be assured of uninterrupted service at a time when a break-down would mean serious embarrassment and loss.

Deering and McCormick Mowers, Rakes and Tedders and International Side Delivery Rakes and Loaders

are doing satisfactory work on thousands of farms. The combined side-delivery rake and tedder is a winner. International loaders lift hay 10 feet without injury to blossoms and leaves. Sweep rakes, stackers and combined sweep rakes and stackers clean up big fields in a hurry, making **haying** time **paying** time.

And hand in hand with every haying tool goes service. The local agent is always in close touch with one of our 16 branch houses, whose resources and facilities are at your service.

PRIZE WINNERS AT CARLETON COUNTY SEED FAIR, FLORENCEVILLE, MARCH 26th, 1919

Wheat, White Fife—1, F. S. Talor; 2, E. L. Hume; 3, Stanley A. Whtie; 4, H. M. Estey; 5, Thos. Stewart; 6, Fred Kilpatrick.

Wheat, Any Other Variety—1, Stanley A. White; 2, James Hamilton; 3, E. A. McCain; 4, Herbert Kilpatrick.

Barley—1, Herbert Kilpatrick 2, E. A. McClain; 3, Otis Shaw; 4, H. M. Estey.

Oats, Ligowa—1, E. L. Hume; 2, H. M. Estey; 3, E. A. McCain; 4, Basil Kilpatrick.

Oats, White, Any Variety—1, Fred Kilpatrick; 2, F. S. Taylor; 3, Thos. Stewart; 4, Stanley A. White; 5, Otis Shaw.

Buckwheat—1, James Hamitlon; 2, Thos. Stewart; 3, F. S. Taylor; 4, E. L. Hume; 5, Fred Kilpatrick; 6, Herbert Kilpatrick; 7, E. A. McCain.

Peas—1, Thos. Stewart.

Beans, Yellow Eye—1, J. Roy McCain; 2, P. R. Semple.

Beans, Any Variety—1, Stanley A. White; 2, Thos. Stewart; 3, W. H. Fowler.

Corn—1, J. Roy McCain; 2, E. L. Hume; 3, P. R. Semple.

Clover Seed—1, J. Roy McCain.

Timothy—1, Thos. Stewart; 2, F. S. Taylor; 3, H. M. Estey; 4, J. Roy McCain.

Potatoes, Green Mountain—1, E. L. Hume; 2, James Hamilton; 3, Stanley A. White.

Potatoes, Irish Cobbler—1, E. Lorne Hume; 2, Fred Kilpatrick; 3, F. S. Taylor; 4, Stanley A. White; 5, James Hamilton; 6, J. Roy McCain.

Potatoes, Any Other White—1, Otis Shaw; 2, J. Roy McCain; 3, James Hamilton.

Potatoes, Red Skin—1, Stanley A. White; 2, F. S. Taylor; 3, Otis Shaw.

Potatoes, Dark Skin—1, F. S. Taylor.

Onions—1, E. L. Hume; 2, Thos. Stewart; 3, E. A. McCain.

Swede Turnips for Seed Raising—1, E. L. Hume; 2, Fred Kilpatrick; 3, H. M. Estey.

Mangel for Seed Raising—1, H. M. Estey.

Turnip Seed—1, E. L. Hume; 2, Thos. Stewart.

Mangel Seed—1, H. M. Estey.

F. S. TAYLOR, Secretary.

PORT ELGIN SEED FAIR

A very sucecssful seed fair and two days short course was held in the Exhibition Building, Port Elgin, March 28th and 29th, under the auspices of the Botsford and Westmorland Agricultural Society.

There was a goodly number of exhibits, all of a high order. Special mention might be made of the exhibits of white Russian Wheat, which elicited much favorable comment; a considerable amount of this variety is being offered for sale in this district. There were also some extra samples of oats and barley. The judging was done by Mr. S. J. Moore of the Seed Branch, Department of Agriculture, Ottawa, to the generai satisfaction of all.

nI connection with the short course a seed judging class was conducted by Mr. C. E. Hicks, of the Soils and Crops Division, Fredericton. Addresses were delivered by Messrs. M. A. MacLeod, Supt. Agricultural Societies, O. C. Hicks, S. J. Moore and others.

On account of the second day being stormy the attendance was not as good as it otherwise would have been, but a number of interested farmers attended the judging demonstrations in the afternoon.

Mr. E. P. Bradt, Sercretary for Agriculture for the Province opened the discussion and conducted the judging demonstrations on beef and dairy cattle, and Mr. Thos. Hetherington conducted the sheep judging on a few of the choice shearlings from the pure bred flock of Mr. Murden Goodwins. Remarks were made by Mr. J.K. King on the co-operative marketing of wool.

This Sign is Your Protection

THE surest, cheapest way of keeping farm buildings in repair is to keep them well painted.

To keep your buildings properly paint-protected it is not necessary, or even good business, to use a cheap paint. True economy consists in buying the very best paint, even though it costs a little more.

B-H PAINT "ENGLISH" 70% Pure White Lead (Brandram's Genuine B.B.) 30% Pure White Zinc 100% Pure Paint

has that proportion of finely-ground pure white lead and pure zinc which, when mixed with strictly pure linseed oil and turpentine, produces a paint of maximum covering capacity. It is due to these fine ingredients, and the correct proportioning of them that B-H gives a fine smooth surface that will not crack or peel, assuring long wear, and making it unnecessary to repaint for a long time to come.

Look for the B-H store, the "paint headquarters" for your territory. The B-H sign which hangs outside a store is, we consider, the best protection we can give a farmer seeking true paint economy.

It's better to PAINT than REPAIR

B-H Products for other purposes

For Interior Finishing
"China Lac," the perfect varnish stain.

Staining the Roof
B-H Shingle Stain in 19 different colors.

B-H Porch Floor Paint
For porch floors, ceilings and parts exposed to the weather.

Plaster Ceilings and Walls
B-H "Fresconette"—A flat tone oil paint.

Finishing a Floor
B-H "Floorlustre" excellent for interior floors.

For Barns and Outbuildings
Imperial Barn Paint.

NOVA SCOTIA GOES ONE BETTER

Kansas brags about buying an Ayrshire bull containing 62½% of the blood of the great Jean Armour——ean Rrmour's Lotus Laddie, owned jointly by the C. P. Blanchard and the Agricultural College, carries 75% of ths blood.

The following article taken from the March issue of the Scottish Farmer, published in Glasgow, Scotland, is a great tribute to the esteem in which Jean Armour, the greatest cow of her day, is held over in Scotland It is interesting to know that the Ayrshire stock bull, owned jointly by C. P. Blanchard and the Agricultural College, is from the same dam but carries more of her blood. If Kansas has bought the best, Nova Scotia has bought the super-best.

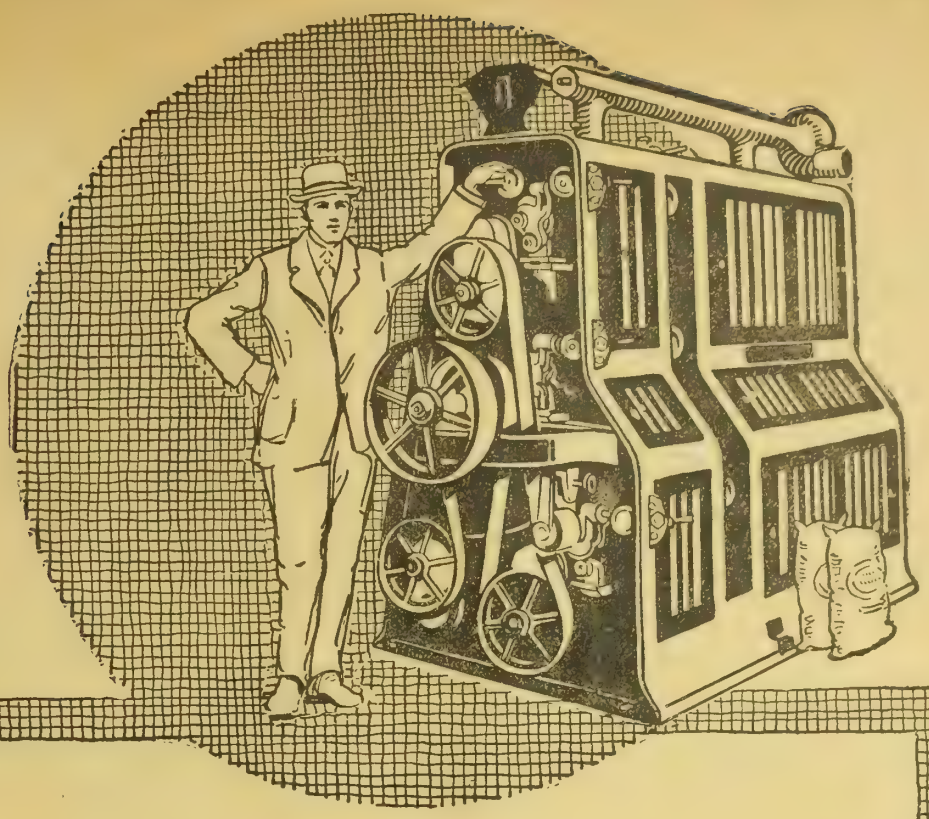
The following is the article referred to:

"Five hundred Pound Ayrshire for Kansas.—Kansas is looming big in the Ayrshire firmament at the present time. A few days ago Canary Bell, Kansas State College's famous Ayrshire, completed a new State record over all breeds, producing 19,683 lbs. milk, 744.51 lbs. fat, and incidentally the largest milk production record produced by any Ayrshire this year. Mr. L. E. Johnson, of Waldron, Kansas, furnishes Kanas with another record, paying five hundred pounds to Mrs. F. D. Erhardt, of West Berlin, Vermont, for the royal bred two-year-old Ayrshire sire, Jean Armour's Dairy King (19338). This is the largest figure ever paid for an Ayrshire sire in Kansas. In the purchase of JeanA rmour's Dairy King, Mr. Johnson has secured one of the greatest line bred bulls in the country. He is a son of the noted cow, Jean Armour, probably the greatest cow of any breed. Jean Armour was the first Ayrshire cow to produce 20,000 lbs. milk, producing 20,174 lbs. milk, 959.65 lbs. fat at the age of eleven years and coming back at the age of fourteen years with a record of 18,382 lbs. milk, 716.35 lbs. fat. eJan Armour's dam Sarah 2nd, was champion dairy test cow of all breeds in Canada and in her fourteenth year produced 11,626 lbs. milk, 442 lbs. fat. Jean Armour's daughter, Jean Armour 3rd, holds a world senior three-year-old record with a production of 21,938 lbs. milk, 859.65 lbs. fat. Jean Armour's Dairy King is line bred, carrying 62½% Armour blood, as well as the blood of Howie's Dairy King, who has twenty-nine entries in the Advance Registery, averaging 11,563 lbs. milk, 453.72 lbs. fat. Howie's Dairy King is the sire of Jean Armour 3rd, and grand-sire of the four-year-old champion August Lassie, 17,784 lbs. milk, 720.03 lbs. fat anad the senior two-year-old champion, Henderson's Dairy Gen 17,974 lbs. milk, 738.32 lbs. fat. Mrs. F. D. Erhardt has bred and developed this wonderful family and the infusion of blood into Kansas will undoubtedly be felt in the years to come. Mr. Johnson has also purchased a daughter and granddaughter of Jean Armour 2nd, who is a full sister to Jean Armour 3rd. Mr. Johnson is president of the Kansas Ayrshire Breeder's Association."

AN INTERESTING POULTRY "DON'T"

So often we are advised to "pound up broken crockery dishes, and so on for the chickens, for grit." If you are wise, you won't.

Why? Well, in the first place, commercial grit will be better and is cheaper than the time and labor spent in breaking up dishes, and, in the escond place, glazed crockery is apt to be poisonous to fowls.



Own This Paying Business

Localize the flour milling business in your district and earn from $500 to $1000 a month in profits. You can do it—and, no experience—either mechanical or technical—is required if you operate a

MARVEL MILL

This is the mill that has put the small milling industry back in the field as a competitor of the big flour mills. Over 1500 Marvel Mills are making money for enterprising men or companies today.

The Marvel Mill is a single unit, self-contained, one man mill that grinds, bolts and purifies—all in one operation. It requires no previous experience because each process is perfectly done by the one mill unit. It requires but half the power of the ordinary flour mill of the same capacity and produces the complete flour and by-products in 45 seconds after introducing the grain.

Made in seven sizes—15 to 100 barrels capacity.

Fill out the coupon attached—either for yourself, your firm or your co-operative society. Full information will be given upon its receipt.

Butter, Dairy, 48c to 56c.
Cheese, none.
Eggs, 39c to 40c.
No hay or straw offering owing to condition of roads.

DAIRY PRODUCE TRADE

Montreal, April 18.—The receipts of butter today were 230 pockages, as compared with 210 for the same day last week, and 661 for the corresponding date a year ago. A very firm feeling continues to prevail in the market and prices were fully maintained with every indication of them going still higher in the near future in a wholesale jobbing way owing to the steady increasing scarcity of supplies. The demand today from grocers and other dealers was fair, and a moderate amount of business was done. The trade in oleomargerine continues fairly active, in a jobbing way, and prices rule firm with sales to 33c to 34c per lb. in 1 lb. blocks, and at 32c to 33c in tubs.

We quote wholesale jobbing prices as follows:
Finest creamery, solids....64c to 65c
Finest creamery, block....65c to 66c
Fine creamery, solids.....61c to 63c

The receipts of cheese today were 221 boxes, as against 204 for the same day last week, and 129 for the corresponding date a lear ago. Outside of a small trade passing for domestic and outside accont in large size cheese at 26½c to 27c, and in small Quebec's at 28¼c per lb., the market was quiet and featureless.

The following prices are being paid by the Commission:
No. 1 cheese.....25c
No. 2 cheese.....24¼c
No. 3 cheese.....24c

New York, April 16.—Butter, firm, Receipts, 12,124 tubs. Creamery, higher than extras, 64½c to 65c; creamery, extras, 92 score, 63½c to 64c; firsts, 62½s to 63½c; packing stock, current make. No. 2, 442½c to 43c. Cheese, weak. Receipts 2,579 boxes. State, whole milk, flats, current make, special, 32c to 33¼c; do. average run, 31½ to 32¾c.

THE PROVISION MARKET

Montreal, April 19.—The feature of the live hog situation continues to be the strong undertone to the market and prices in Toronto yesterday scored a further advance of 25c per 100 lbs. as compared with those paid last Thursday with sales at $21.25 to $21.50 per 100 lbs. weighed off cars, and at $21 to $21.25 fed and watered. In sympathy with the above and the continued light supplies coming forwarde here coupled with the keen competition for the same between packers, a strong feeling prevailed in the local market today and prices advanced 25c per 100 lbs. with sales of selected lots at $21.25 to $21.50 per 100 lbs. weighed off cars, and lots to $19.50. The market for dressed hogs was also stronger and prices were marked up 50c per 100 lbs. The demand was steady for small lots and a fair trade was done in a jobbing way in city abattoir fresh-killed stock at $28.50 to $29 per 100 lbs.

MILL FEED AND ROLLED OATS

Montreal, April 19.—There continues to be a good steady demand from all sources for millfeel in mixed car lots, and owing to the increased production of some lines of late a more active trade has been done, and the movement will likely keep up fairly large for another month or until the pastures are in good condition for the cattle. The tone of the market is firm with sales of feed cornmeal at $64, mixed grain mouille at $58 to $60, pure barley meal at $56 to $58, mixed moullie at $50 to $52, dairy feed at $46 and oat middlings at $44 per ton, including bags, delivered to the trade, and car lots of bran sold at $44 to $46, and shorts at $46 to $48 per ton, including bags, ex-track. The market for rolled oats is quiet and steady with broken lots of standard grades quoted at $3.75 to $4 per bag of 90 lbs., and Golden cornmeal at $4.50 to $4.75 per bag, delivered to the trade.

THE BALED HAY MARKET

Montreal, April 19.—There was no further change in the prices for baled hay on spit today, but the tone of the market is very strong on account of the very limited supplies coming forward from the interior, and it was reported today that sales of No. 1 timothy hay were made at points of shipment as high as $30. The demand for spot supplies was good and sales of car lots of No. 1 timothy hay were made at $29 to $29.50, No. 1 light clover mixed hay at $28 to $28.50, No. 2 timothy hay at $28 to $28.50, No. 2 clover mixed hay at $27 to 27.50, and No. 3 timothy hay at $26 to $26.50 per ton ex-track.

ANOTHER DECLINE IN GRAIN PRICES

Winnipeg, April 18.—Messrs. Baird & Botterel wired Shearson, Hammill & Co. the following:

Oats—Market lost ground today and was dull and featureless. In spite of navigation opening, no shipping business was in evidence and receipts will increase substantially by reason of relief afforded terminals. American news was rather bearish. Further labor troubles at the seaboard and an improvement in Argentine shipping a factor. Eastern consuming markets exceedingly dull.

Barley—Lower in sympathy with other grains. Merchandising business conspicuous by its absence. Trading was dull and featureless. We still maintain that there is liquidation to take place in the May position.

Flax—Easier tone with trade very dull.

Fluctuations in grain today were:

	Open.	High.	Low.	Close.
Oats—				
May ...	.72	.72¼	.71⅜	.71½
Jluy ..	.74	.74	.73⅜	.73⅜
Oct. ..	.67⅞	.67⅞	.67⅞	.67⅞
Barley—				
May ..	$1.02	$1.02	$1.00½	$1.00½
Flax				
May ...	$3.65	$3.65½	$3.63½	$3.63½
July ..	3.61	3.61	3.60	3.60

Cash prices closed:

Oats—No. 2 C.W., 71c! No. 3 C.W., 67¾c; extra No. 1 feed, 68c; No. 1 feed, 66c; No. 2 feed, 62⅝c.

Barley—No. 3 C.W., 99⅞c; No. 4, C.W., 94¾c; rejected, 88½c; feed, 88½c.

Flax—No. N.W.C., $3.66; No 2 C.W., $3.58½; No. 3, C.W. $3.43½.

EGG PRODUCTION LARGE IN COUNTRY

Montreal, April 19.—Receipts of eggs throughout the country are very heavy, but the demand is unprecedented, and notwithstanding the heavy production prices have shown a further advance. Country shippers in Ontario report having paid stores from 42c to 44c and made sales at prices hanging from 43c to 45c f.o.b. for current receipts, cases returnable. One shipper reports that he was confronted with a buyer who came into his district offering 45c for stores; to meet this price and get out with a profit he will have to get 46c f.o.b. Offers from Winnipeg and Regina have been received in the east recently on a basis of 42c and 43c for firsts f.o.b. western points, cases free. Production is increasing very rapidly in the prairie provinces, and an increasing movement of eggs from the west to the east may be expected. Prices there are considered too high for storing and as soon as a carlot can be accumulated it is shipped out.

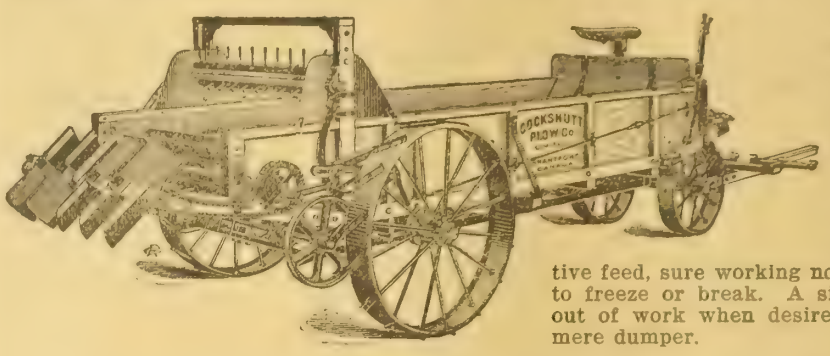
Even at the present high level eggs are cheap food in comparison with the cost of other meat products, which accounts for the very heavy consumptive demand. The quantity in storage so far is light, but the movement into the coolers is now becoming more general. Up to the present the surplus has been almost entirely taken for export to Great Britain.

Twelve cars of eggs were exported to Great Britain last week. Early in the week it was reported the demand from Great Britain had slackened, due to the advancing price on this side Since then, however, more inquiries have been received. In the United States it is said a much larger export trade could be done. The limited ocean steamship space is the one thing that is limiting the business.

Really Efficient Fertilizing

To get the good out of that "gold-mine" manure pile you must have a manure spraeder that (1) makes the work easy, (2) does the spreading absolutely evenly and (3) does it quickly. This means a spreader of great strength and of latest design backed by years of Canadian field experience—yet of light draft and simplicity of operation so that a good day's spreading leaves men and horses unwearied. This means choosing the

COCKSHUTT MANURE SPREADER



It is built low, top of box is just waist high, 41 inches from ground (17 inches clearance underneath) so loading is easy. The TWO pulverizing cylinders at end mean absolute breaking up of lumps and another special Cockshutt feature the wooden paddles at the back, rotate and distribute the manure thoroughly over much more than the machine's width. Simple positive feed, sure working no matter how big the load—no gears to freeze or break. A simple lever throws the distributors out of work when desired. Here is a real spreader, not a mere dumper.

A manure spreader can be a 100 per cent profit maker every season if it has the RIGHT RESIGN. The Cockshutt Manure Spreader should be your first study—write our nearest branch for special spreader folder, "Better Fertilizing and Bigger Crops."

THE FROST & WOOD COMPANY, LIMITED

Truro ST. JOHN, N. B. Charlottetown

One Chicago dealer reports a sale for export of 7,000 cases.

The poultry population of France is said to be 50 per cent. below what it was in 1913. Eggs were jobbing in the "Les Halles Central" Paris, March 26th at 360-370 francs per 1,000 (about 92c a dozen), 340-350 francs for current receipts small removed (about 87c per dozen), and 250-260 francs for Morocco. France's normal pre-war egg imports amounted to 35 million dozens. Present prices are favorable to business with Canada. Retail prices in stores range from 4 francs per dozen (80c) to 50 centimes per egg ($1.20) per dozen.)

There was no further change in the condition of the local egg situation today, but the tone of the market is firm with a continued good demand for supplies and an active trade was done in a jobbing way at 48c to 49c per dozen. The receipts today were 1,902 cases, as compared with 2,926 for the same day last weeek, and 2,561 for the corresponding date a year ago.

On account of the continued wet weather throughout the country the bad state of the roads, the deliveries of potatoes were again light today, and this, coupled with the fact that stocks on spot are small and the demand good, the undertone to the market was strong and the prospects are that prices may possibly go still higher. The trade in a jobbing way is fairly active with sales of Quebec white stock at $1.90 to $2.00 per bag of 90 lbs. ex-store, and car lots at $1.60 to $1.65 ex-track.

A good steady business continues to be done in maple product in a jobbing way and the market is fairly active and steady with supplies ample to meeet immediate requirements. Sales of maple syrup were made at $1.95 to $2.00 per tin of 13 lbs., and at $1.55 to $1.60 per tin of 8½ lbs. The demand for maple sugar is good and prices are maintained at 22c to 24c per lb.

1919 SPRAY CALENDAR FOR NEW NEW BRUNSWICK APPLE ORCHARDS

(Continued from page 787)

stone, ten pounds of either water slaked stone lime or hydrated lime and one pound of arsenate of lime to forty gallons of water. Drench thoroughly, spraying in every direction. The poison applied in this spray will control late feeding caterpillars such as Fall Web Worm, Red Humped Caterpillar and Yellow Necked Caterpillar.

Modifications for Special Insects

Green Apple Bug.—Where this pest is present substitute for the First Spray the following formula: Two pounds soluble sulphur, one pint nicotine sulphate, to 100 gallons water, omitting the arsenical poison. The addition of 4 pounds of fish oil soap to each 100 gallons improves this spray. If green apple bug is serious, use this formula for the second spray also, instead of the regular ane, drenching thoroughly.

Canker Worm.—Where this pest is present use 2½ pounds dry lead arsenate, 2 pounds of lime to 40 gallons water, instead of the regular formula for the first spray. Do no use any fungicide with this quantity of lead arsenate.

Aphids.—If aphids appear in the orchard add three quarters of a pint of nicotine sulphate to each 100 gallons of the formula recommended for the period, and spray thoroughly.

Preparation of a Quickly Made Bordeaux Mixture

To make Bordeaux rapidly put the required amount into the spray tank. Start the engine, and with the agitator running, fill the tank. While the agitator is still running add the hydrated lime and finally the insecticide. The Bordeaux is then ready to apply.

If using a barrel pump, place the required amount of powder or dissolved bluestone into the barrel, start the pump with the relief valve open so that the water will empty back into the barrel, and with the pump working, fill the barrel .With the pump still working pour in the hydrated lime (or mix in a pail of water and then add) and finally the poison.

Warnings

Do not use arsenate of lime alone on apple foilage.

Do not use arsenate of lead with soluble sulphur..

Do not use Bordeaux Mixture for the Second Spray, i. e., immediately after the blossoms fall.

In making Bordeaux for apple spraying do not use less than three parts of lime to one of copper sulphate.

Do not leave soluble sulphur exposed to the air; keep it in a closed container.

Be sure to add the lime to the soluble sulphur arsenate of lime combination.

Most of the common insecticides are safe when used with Bordeaux.

Measure the capacity of your spray tank.

If the first spray is applied closer to the opening of the blossoms than five days before, some slight russeting and paling of the fruit may result.

The use of lime sulphur and soluble sulphur ois advocated for one spray only, because used as a blossom spray neither of them is as efficient in scab control as Bordeaux. When used as a last summer spray the same reason holds true and in addition lime sulphur is liable to cause dropping of the set of fruit.

Be careful with the lime sulphur and do not wet the under side of the leaves with it more than can be helped or possibly some removal of the crop will result. Be liberal with the lime in all combinations as it will prevent leaf injury.

USEFUL HINTS IN BUTCHERING HOGS

Butcher hogs at home.

Give them water but no feed for a day before killing.

Bleed the hog with an 8-inch straight-bladed knife.

Be sure bleeding is done before scalding, or the skin may be left too red.

A heavy blow with an axe between the eyes will stun the animal before sticking.

The meat may spoil if the animal is excited before killing, or the weather is warm afterward.

Scrape as quickly and rapidly as possible after killing. The cold carcass is hard to scrape well.

Bleeding will be finisned more quickly if the animal lies on a steep slope with its head down hill.

Keep the hog moving in the barrel. If the animal is left pressed against the barrel the hot water cannot get at that part of the carcass.

Scraping is easier if a shovelful of hardwood ashes, a lump of lime, some ioncentrated lye, or a handful of soft soap had been added to the water.

Use a themometer. Do not attempt to scald with water at above 150 degrees. A good scald can be obtained at 140 degrees, but it takes longer.

In opening carcasses, split the pelvic bone between the hams with a knife by cutting exactly in the centre. To open the breastbone with a knife, cut a little to one side of the centre, but do not let the point of the knife get behind a rib.

APPLE TREES FOR SALE

Three years old, 5 to 7 feet, good thrifty stock (1st class) in Wagner, Red Stark, Wolf River, Cot's Orange Pippin, Ben Davis, Stark and Baldwin.
$25.00 per 100.

A GOOD ADVERTISING MEDIUM

A Leading Maritime Stock Breeder Tells of Results He Secured rom Advertisinig in the Maritime Farmer

Dalhousie Jct., N. B.
April 14, 1919.

The Maritime Farmer,
Sussex, N. B.

Dear Sir:—

In ordering a change of our adv. and to prove the Maritime Farmer gives results as an advertising medium, I will mention a few of our recent sales.

To Mr. Jos. Bernier, Levis, Que., a 5 year old cow. To Wm. Mann, Upsalquitch, a pair of calves. To Mrs. L. E. Doherty, "Gauld Grant Farm," Bathurst, a hanadsome heifer calf out of Millie Pontiac Puedge. To J. Walter Jones, Charlottetown, P.E.I., the 5 year old cow Abbekirk Queen's Countess that last winter made over 30 pounds butter in 7 days. This cow was tested as a 2 year old, as a year old and as a 5 year old and her averge test for the 3 years was nearly 5% fat ,tested under proper conditions; this cow is far from her limit. This cow is a daughter of our old senior herd sire. Maple Grove Mercena Mercedes, and for dam a full sister to Maple Grove Patti, record 32.58, raised by us and sold to Logan Bros., Amherst Point, some years ago. To Thos Reardon, Sussex, N. B., the 5 year old cow Homestead Lass, which cow as a junior 3 year old made 25 lbs. butter in 7 days and milked over 80 lbs. milk per day. This should make a grand foundation cow for Mr. Reardon. To essrs. Gesner, A. Taylor & son, Salisbury, a 15 months old daughter of Maple Grove Blancha by Homestead Hengerveld Rooker. This should make a grand foundation cow for Mr. Taylor, as she comes from a long line of heavy producers tracing back to such noted animals as Pontiac Korndyke and Blanche Lyons her G. sires fur nearest dam averaging over 30 lbs. butter in 7 days. To Edgar Hicks, West Bathurst, the 5 year old cow Millie Pontiac Pledge, her record made last winter as a sr. 4 year old being over 24 lbs. butter in 7 days and milked up to 80 lbs. per day.

Although we have sold some good ones we still have some that will be heard from, a few of which deserve special mention. Eloise De Kol Colontha, freshened at 2 years and 13 days and over 4 months after freshening in an official 7 day test made 17 lbs. butter and averaged almost 60 pounds milk. This heifer milked up to 68 lbs. per day from 3 milkings when fresh and in this condition. She has a dam Eloise De Kol Netherland. one of the very best types of a Holstein cow in Canada. I will quote you the remark made by Mr. H. M. Holby while judging at the Chatham Exhibition a few years ago, that only in every few years a cow to equal her appeared at the Toronto Fair. However thiis heifer has for a sire the great and richly bred "King Lyons Colontha." All readers of the Maritime Farmer interested in dairy cows should keep tabs on this heifer's performance.

Those already mentioned with the daughters of Homestead Lass, Abbekirk Queen's Countess, Millie Pontiac Pledge and sired by such bulls as Maple Grove Mercena Mercedes and Homestead Hengerveld Rooker, make up the greater part of the herd, together with our recently imported jr. herd header, King Korndyke Johanna No. 32916, who has for a dam Jemima Johanna Wayne, the highest 7 day record cow ever developed at the famous Riverside herd, owned by J. W. Richardson, Caledonia, Ont. He has for sire King Johanna Pontiac Korndyke, one of the richest bred sires in Canada, his dam being a 29.14 lb. daughter of Pontiac Korndyke, and also dam of Pontiac Lady Korndyke 38.03 lbs butter in 7 days, the highest record daughter of her noted sire.

As mentioned elsewhere in this

PROTECTION is today the keynote of international trade preparations.

GREAT BRITAIN is restricting imports and PROTECTING home industries.

Acting Premier Watt of AUSTRALIA announces the introduction of a measure for higher PROTECTIVE duties

FRANCE is exercising Government control of imports to build up home manufactures and home markets

ITALY'S after-war programme calls for a higher PROTECTIVE tariff.

A higher tariff for the UNITED STATES is forecast by Chairman Fordney of the Ways and Means Committee of the next United States Congress, who will be the author of the new tariff bill. Congressman Gillett, of Massachusetts, who will be the Speaker of the House of Representatives in the new Congress, says, "at the earliest opportunity there should be passed by the Republicans of the House a protective tariff measure which will provide more abundant revenue and prevent an inundation of foreign goods produced by cheaper labor."

GERMANY depends on PROTECTION to recover its commercial position.

Under PROTECTION, CANADA has success-fully borne the burden of four and a half years of war. Wages have been high and agriculture and industry have prospered. The present is no time for economic experiments

paper, we are planning on making some improvements about the farm this coming season and consequently will put a price on nearly anything.

R. L. HICKS.

HOW TO PREVENT BEES FROM SWARMING

No matter how much room we give the bees, sometimes they will persist in rearing queen cells and preparing to swarm. If we do not do something to stop them they will swarm. Swarming will mean a much less chance for gathering a surplus of honey unless we make the swarm go back to the same stand anad manage the bees so as to give the swarm all the workers we possibly can from the old hive. To make this swarming business work to our profit with the least trouble we can shake the bees from the frames in what is known as "shake swarming."

Shake swarming should not be done until as near the time for the honey flow to begin as possible. You can cut out all the queen cells at a time or two if you wish to go to that trouble, and sometimes the bees will give up swarming when this is done. If they build again after you have cut them out twice you had better shake them.

I always take one frame of brood and be sure there is no queen cell on it and put in a new hive on the stand where the old hive stood, moving the old hive to one side. Then I shake all the bees from all the frames in the old hive down in front of the new hive. I try to get the queen on the frame of brood I put in at first, for there is danger that she might be injured in the shaking or lose her way and get into some other hive. One frame of brood from the old hive that has a nice large cell or two I do not take out or shake the bees off, as the shaking would be apt to kill the queens in the cells.

If you have a super cover with a bee escape in it put this on top of the new hive and bore a haff-inch hole in the hive a couple of inches from the bottom or make a small entrance right at the bottom so the bees can go in and out of the upper hive as they wish. You leave this hive on top of the other ten days if the honey flow has not begun, and then you take it off and set on a stand where you want to leave it to build up. If the honey flow is on you wil lhave to put a super on your lower hive, so you will not leave the old hive above more than a couple or three days. The longer you leave it there the more bees wil begin flying from it and as thse all go back to the swarm in the lower hive after you remove the upper it makes that stronger, and that is the hive that will furnish the surprise, as the other will only build up ready for wintering.

Watch the old hive where you set it and see if the queen begins to lay before long, so you can be sure that there isa queen in it. If there should be none you put it back over the other hive with a newspaper between the two and let the bees mix after they have gnawed away the paper.—L. H. Cobb.

SHORTHORNS ON THE RANGE

Mr. A. E. Cross, Calgary, Alta., who carries on an extensive ranching business in Alberta, makes the following statement:

"I could not carry on a cattle business without Shorthorns. Not saying anything deprecatory of other breeds, the Shorthorn suits our purpose, and we are running a herd on the open range. The make us 200 pounds more beef than would be possible with other cattle." He also states that what the Western cattle industry needs is bigger cattle, which insures more beef to the animal, there being no difference between fixed charges on a 1000 lb. steer and a 1200 lb. steer. Mr. Cross uses both Shorthorn and Hereford blood, claiming that he gets the best resutls from cattle which carry about two-thirds Shorthorn and one-third Hereford bolod.

B. J. Erwin, Douglas, Wyo., marketed his two-year-old range steers weighing 1041 lbs., practically the same weight as the average three-year-olds from the same range; and the steers of the Fiddleback outfit by Shorthorn bulls weighed 1230 lbs. at Omaha, about 200 lbs. more than the average steers not carrying Shorthorn blood.

Wherever the Shorthorn goes we can trace its influence for good. Big, growthy, sappy steers are characteristic results from using Shorthorn bulls on the range, as elsewhere.

CARE WITH LANTERNS

Where used around the barn it should always be recognized that a lantern always constitutes a fire risk. However, it can be used with comparative safety if reasonable care be exercised. Most lantern fires start from the lantern being accidentally overturned. The oil then begins to trickle out and in a moment there is a blaze which, because of its nature, is exceedingly difficult to smother. To avoid the overturned lantern it is well to go through the barn and install hooks on the wall or rafters at every point where it is likely one will wish to set down the lantern in the doing of the chores about the place after dark. A splendid plan also is to string a wire back of the cows and in front of the mangers from one end of the barn to the other. A hook is then placed on this for holding the lantern, which can be moved from stall tostall as the chores are done.

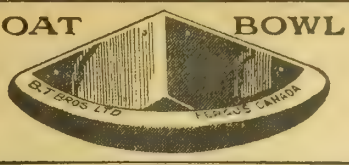
RECORD PRICE FOR A BULL

(London Times, February 22)

The British rceord for the highest price for a Shorthorn was broken at Penrith, when Gartley Lancer the First, champion Shorthorn bull, the property of Mr. J. W. Barnes, of Aikbank, Wigton, was sold for 4,750 guineas to Mr. M. Marshall, of Stranrear. He was calved in February, 1917.

This is the highest price ever paid for a Shorthorn at a public sale in this country. At the dispersal of Lord Dunmore's herd in 1875 Lord Fitzhardinge gave 4,500 guineas for the bull "Duke of Connaught," and the next highest prices were the 4,200 guineas each realized for the King's champion and Lord Manvers's reserve champion at Birmingham this week.

A bird first off the roost in the morning and the last to return to it at night is considered a better layer than the one that spends the major portion of her time on the roost, or stands around wtih a "humped-up" appeaarnce in a corner of the pen, or basks all day in the sun.



A Handsome Horse Stable

Our good Canadian farmers take pride in their horses. They take pride in having their horses looking well. And horses always look their very best in a handsome stable. You would be glad to show a visitor or buyer through a stable like the one in the picture above. The open construction of the steel guards allows the sunlight to flood into every stall. The steel fittings, too, will always look well because the steel is practically indestructible. It cannot be disfigured by cribbing or kicking.

Let us send our Barn Book which shows many fine photos of horse stables and describes these steel fittings completely.

VALUE OF PURE BRED SIRE AT THE HEAD OF THE HERD AS TOLD IN HIS PROGENY

A synopsis of a splendid address by Prof. W. F. Fraser of the Illinois Experiment Station. Be sure and read it.

A few poor cows may do little permanent harm to the dairy herd, but a poor sire will do untold damage. Frequently dairymen hold the penny so close to the eye it is impossibile to see the dollar a little farther off, and this is just what a man is doing who has a good dairy herd of grade cows and thinks he is economizing by buyng a poor or even common sire.

If the good pure-bred sire improves the milking capacity of his daughters only one and one-half pounds of milk at a milking, above the production of their dams, this would mean an increase of 900 pounds of milk for the 10 months or 300 days an ordinary cow should give milk. The daughter would also be a much more persistent milker; that is, would give milk for a longer time in the year, and she would regain her flow of milk better after an unavoidable shortage of feed, as in a summer drouth. These daughters may certainly be credited with 1,000 pounds more milk per year than their dams produced. At the low estimate of $1 per 100 pounds this extra amount of milk would be worth $10 per year. The average cow is a good producer for at least six years, or until she is eight years old. It will, on the average, be four years after purchasing the sire, before his first daughters will have brought in the first extra $10. Eight dollars and twenty-three cents kept at compound interest for these four years at five per cent. will equal $10, so the daughter's improvement or increase of income the first year is worth $8.23 at the time her sire is purchased. The cash value of the daughter's improvement (inherited from the sire) figured in the same way for each of the last six years she gives milk, is shown in the following table:

Improvement first year	$8.23
Improvement second year	7.83
Improvement third year	7.46
Improvement fourth year	7.11
Improvement fifth year	6.77
Improvement sixth year	6.45
Improvement for six years	$43.85

The total increased income of a cow over her dam by having a good sire is therefore $43.85.

In an ordinary dairy herd of 35 to 40 cows an average of 17 heifers per year should be obtained, and 12 of these should be worth raising, making it easily possible for a bull to earn 12 times $43.85, or $526 a year. This would amount to $1,578 in the three years that a bull is ordinarily kept in service.

Cost of providing every heifer one good parent:

	Pureberd	Scrub
Cost of sire	$150.00	$ 30.00
Interest, 3 years, 5 per cent	22.00	4.50
Cost of keeping, 3 years	100.00	100.00
Risks, 3 years	50.00	10.00
Total expense 3 years	$322.50	$144.50
Value at the end of 3 years	100.00	30.00
	$222.50	$114.50
	144.50	
Extra cost, good sire, 3 years	$108.00	
Extra cost, good sire 1 daughter	3.00	

Considering the male calves as worth no more than if sired by a scrub, it would then cost $36 to provide one good, purebred parent for the 12 heifer calves which are raised each year, or $3 per heifer. Where else can such an investment be found? Three dollars expended brings in an average return of over $7 per year for six years, or $43.85 in all. This makes a clear addition of $43.85 to the income of each daughter, or a net profit of $40.85 nd of $1,470 for 36 daughters in three years. Here is nearly 1,000 per cent. profit on the investment. The original cost of the good sire looks very small beside the $1,470. It really pays to, as nothing else on the farm pays, to put $150 into the right kind of a dairy sire that will return practically ten times $150 within three years.

An examination of the details will show these estimates to be conservative. There is plenty of margin left for figures and unfavorable conditions. One thousand pounds of milk per year is a conservative estimate of the improvement of the daughter's production to credit to a good sire, but the details of figuring it may be varied to suit conditions in different herds and different localities. One hundred and fifty dollars is certainly a liberal allowance for the purchase of a pure bred sire, and results here named are based upon having a first-class animal at the head of a herd. A herd of only 35 or 40 cows is taken for illustration while a vigorous sire properly fed and exercised is sufficient for a herd of 45 to 50 cows, provided he is not allowed to run with them. There is another distinct improvement of the good sire's daughter besides her milk production; it is the improvement of her blood or breeding, as the result of which her daughter will be better milk producers.

This blood improvement of all the daughters accumulated through a series of years means a remarkable increase in the efficiency of the herd.

It is the common experience of all dairymen, who have used a really good improved dairy sire that the investment has made them royal returns. The $150 cost price looks "too big" only to the narrow vision that cannot see the natural improvement of the herd cattle certain to follow. Many a dairyman might have reason to pay a big price for a fine cow, but the same argument does not apply at all to the purchase of an improved bull, because the sire's influence spreads so much farther and faster than that of the cow.

If the heifer calves are to be raised for dairy cows there is absolutely no business reason on earth for keeping a scrub bull. The dairymen who think there is, pay a heavy price annually for maintaining that tradition. The scrub bull is the most expensive and extravagant piece of cattle flesh on the farm. He does not stop at being merely worthless, but will lose the farmer the price of two or three good bulls every year he is kept. The dairyman could not afford to keep a scrub bull if the animal were given to him, if he were paid for boarding the beast and given a premium of $100 per year for using him. The presence of the scrub in so many Canadian herds—many times without a single qaulification except that he is a male—is an offence and disgrace to the dairy business and a plain advertisement of the dairyman's thoughtless bid for failure. The only thing on earth the scrub sire is good for is sausage, and it is high time that this plain and simple truth were given practical acceptance on every dairy farm.

By all means get a good dairy sire if you have to sell two or three cows to do it. The improveed sire is, without question, the most economical investment in any dairy herd.

CAUSE AND CURE OF MILK FEVER

Can you tell me what causes cows to have milk fever and how can we prevent the disease?—S. M.

Reply.—The exact cause of milk fever is unknown, but it is thought to be due to bacteria in the udder, aroused to activity when the cow calves. The animal loses the power of her hind legs and becomes unconscious. The inflation of the udder with sterilized air, pumped in by means of a special milk fever "outfit" quickly proves remedial in most cases. A cow is much less likely to have an attack if "dried off" for six weeks before calving, and during that time is exercised daily and lightly fed in such a way as to keep her bowels somewhat relaxed. Also avoid milking the cow out clean for a few days after calving. Better let the calf suck for three or four days if the cow is subject to attack.

A Barrel of Apples from Each Six-Year-Old Tree
—a good crop—yes, but you can do it, by planting your trees with
C.X.L. Stumping Powder
Spade-planted trees have cramped and soil-bound roots and their growth is slow and uncertain. Trees planted with C. X. L. reach out with their roots and obtain all the rich fertility and moisture in the sub-soil. C. X. L, not only digs the holes for planting but it breaks up the hard pan.
Fruit trees planted with C. X. L. are healthier, stronger, grow faster and bear quicker than spade-planted trees.
Use C. X. L. for digging tree holes and ditches, for blasting boulders and stumps. Our booklet "Farming with Dynamite" tells how you can use C. X. L. profitably on the farm.

Successful Co-operation in Nova Scotia

Address by A. E. McMahon, Manager United Fruit Companies of Nova Scotia at the New Brunswick Farmers and Dairymens Association

Mr. Chairman and Gentlemen,—

It affords me a great deal of pleasure to have the opportuntiy of coming up here and giving a short address in connection with co-operation. I have to ask you to pardon me, if I refer to the Province of Nova Scotia quite often, on account of the fact that the work we have accomplished has reference to that province. I want you to understand that we in Nova Scotia are in sympathy with New Brunswick and every other province in Canada, as far as agricultural interests are concerned. In giving you an outline of our work in Nova Scotia, it is in order that you may get some information therefrom and be enabled to go forward and do better in future.

The United Fruit Companies of Nova Scotia were organized in the early 90's, through force of circumstances. We discovered that we were being wokred against by large interests. I want you to bear in mind that I am not referring to this through any motive of jealousy, because personally I do not blame any man for making as much money as he can, so long as he makes it legitimately. Then, again, in the early 90's tranpsortation was one of the most difficult problems. Large interests were able to pick space and resell it or draw a rebate from all the freight shipped out by the purchaser. In our province, for instance, a speculative interest might pick out his space; when a portion of that was filled up, a higher rate was charged to the purchaser or shipper and the difference was rebated back by the Steamship Company to the speculator. These facts became known to different business interests and we decided it was time the purchaser had that which belonged to him.

In 1896 a committee of three was appointed, and they were authorized to go out in the markets of the world and endeavor to charter a few steamers, outside of the subsidized lines. They succeeded in chartering two boats. In those days subsidies were given to mail boats and those boats carried our freights and made extra profits, so, regardless of subsidies this Committee chartered two boats in New York and brought the first one to the old town of Annapolis Royal. We had no difficutly in obtaining the first load. The result was that by the time the first ship was loaded, speculative interests, transportation interests, and steamship companies got busy. The price of apples went up 25c or 50c per barrel, owing to cash offers being made for them, in advance of the market value; these offers were made to growers having space reserved on the second boat. Enough gave way to this temptation to render the gathering of a cargo for the second boat most difficult. Then the transportation companies saw fit to get in touch with and keep in touch with the personal interests and their purchasers, with the result that this was not tried again until 1907. Think of it,—the large dealers who were drawing the revenue from the people of Nova Scotia succeeded in keeping the people from getting that which was their own for eleven years.

In 1907 the people decided to form a Company and erect a warehouse. The members of this Company built their own warehouse capable of handling some forty thousand barrels per season. They hired a Manager, also a packing crew of some 7 or 8 or 10 men to come in in September and work throughout the entire season. In 1910 the result was some 22 co-operative companies were organized in the Annapolis Valley. It was soon found that the companies would underbid each other in selling,—if a speculator came into the vicinity and said "I will give you $2.00 per bbl. more for your apples," the companies would hold out for price, so that the different co-operative companies became the individual.

Early in 1910 we decided to call a meeting of representative men composing these 22 companies; the meeting was called and it was decided to form the 22 companies into one organ ization and work for one year under a Manager as an experiment, without any legal binding. Sometimes we experienced difficulty in holding the companies together and we could not get the freight we required for transportation and for sale. At the close of that season we decided that we would extend our operations, that we would organize more companies and affiliate them under one head. The 22 Companies were incorporated under what is known as The United Fruit Companies of Nova Scotia, Limited. There was a Board of Management composed of 5 men, who elected a General Manager—one man representing those 22 companies. We did $740,-000. worth of business beginning 1911 and closing 1912.

Now, gentlemen, I want to refer to one thing. The life has not been altogether smooth with us,—it is not going to be altogether smooth with you. Farmers are apt to be suspicious one with the other. We had tried several organiaztions previously and had not been able to hold them together, on acocunt of local dealers. There is only one way to make a success,—make it a commercial agency, give them more for their goods, give them their supplies cheaper; once you fail to do that, members will drop away from you as rapidly as they came to you. Those are the experiences we have had, and they have been bitter on some occasions.

As I stated before, at the end of 1912 we had a turnover of $750,000. and we had some 1100 or 1200 farmers together. Our Company had increased, during the following year eleven or twelve companies, and our people were thoroughly convinced the co-operative principle was right. The United Fruit Companies are now a staple and responsible institution. They are a necessity in that there are not enough speculators in Nova Scotia to handle the crop of apples and pay the losses of an adverse esason. That they are financially sound is evidenced by the fact that at times during the past season the credits advanced by the Bank amounted to a total of slightly more than one-half million dollars. A lot of our success is due to the fact that we have done our business along commercial lines. We have from seven to eight departments, including apples, flour, wheat, etc., but we see to it that every Department we run is absolutely self-sustaining.

I listened to Mr. McKenna with a great deal of pleasure,—I see you are accomplishing something here, you have commenced well and you have a prospect of going ahead, but I want you gentlemen to remember, before you go any further, you must have competent officials and you must pay them for doing their work and you must see that every department is handled to have a credit on the right side of the balance when you close up your business.

In 1907 there were about forty potato representatives of Europe Commission Agents, representing English Commercial Houses. Those representatives must have been good men; of necessity those men must have been worth $1500. or $2000. a year and their expenses, otherwise those strong old firms would not have esnt them to the Province of Nova Scotia as their representatives and asked them to obtain consignments of goods for London, Liverpool, Manchester, Glasgow, or wherever it might have been. Those men were eating up profits that really belonged to the producer.

The first year of our work was most strenuous, we had opposition from all directions—from European Houses, and from the speculative interests. It has never been our policy to do any knocking—we simply went ahead and did our business. We believed if we made good we would be supported and if we did not make good we would not be supported. The first year we did not send a representative to the European market, through correspondence we marketted our goods direct. The second year we spent $3000. to send a getnleman to London to look after the London and Liverpool markets. The third year we didn't have any representative from any European Commission House,—we were doing our business direct and as a result we cut the rebate system and reduced the handling charges 2%, which in all increased the price of apples 32c per bbl. or 25c clear of our present handling charge of 7c.

Now you can see that it was nothing but the large body of farmers getting together under one head that was able to accomplish this work in 1911 and 1912.

That is not all we accomplished in connection with the marketting of our fruit. We employed our own Inspector working throughout the entire season and finishing up when the apples were packed out in the Spring. Previous to this, unscrupulous packers and individuals had put out a pack which gave Nova Scotia fruit an unenviable reputation on the markets. Having the Inspector enabled us to see that all the Company Fruit was packed to one high standard, and any such thing as fault being found by a Government Inspector was absolutely unknown to us—it was acknowledged by all the inspectors that it was not necessary to inspect the United Fruit Growers pack. This high standard of pack at once captured the local markets for the United.

There are five companies who own stock in the United who are not working with us at the present time; there are six more companies who left us but came back again; the five companies are outside because of local or personal prejudice, outside of good business reasons. We are 43 companies who have subscribed 20% of their capital stock in our organization.

I know that you people in the province of New Brunswick are large users of poisons. We experienced difficulty in getting direct connection with wholesale firms who would give us jobbers prices. Our first purchase was in 1912 and consisted of twenty-two tons of Arsenate of Lead. It was rather more than we required that year, but it was absolutely necessary that our Manager at that time should purchase direct from the Company. In 1913 twenty-six tons of Lead were ordered, the order being divided between two firms. We soon recognized the folly of dividing our orders and set about selecting the brands that suited our requirements and then invited tenders from the various firms on our total requirements of each separate article.

Before making any purchase of poisons we submitted a sample of all quotations to the gentlemen in charge of these departments for analysis and that is how we discovered when a dangerous article was being placed on the market. We hold meetings once a year when either Mr. Sanders or Mr. Brittain is present and explains the different diseases and insects it is necessary to combat.

Now I don't know that it is necessary to say much more, only in con-

nection with the cost of the article. I state publicly that we have made our purchase of poisons this present year cheaper than any other concern in the Dominion of Canada has purchased. I say that our lime and our lead and our poisons are cheaper than those offered on the market by any other concern in the Dominion of Canada. It is true that competition may occur, it is true that once our prices are known, other concerns may say "We will compete and meet those pirces," but I stand behind my statement that we have caused a reduction in our purchases of arsenate of lime of 8c per pound.

Not only that, we have been able to avoid mixtures that are not satisfactory and that might have done an injury.

Another point—a great many of the people in our province have gone over to dusters. The dust was retailed at the beginning of this season at 11½c per lb. We can deliver it now at 8½c per lb. We always pay cash. Even with this we were not satisfied. We went further into the situation with the result that we are buying an extra fine grade of superfine sulphur in United States and our arsenate of lead in Canada. We will do the mixing in one of our warehouses and allowing ourselves the largest profit we have ever taken on spray material will furnish our members with 00-10 sulphur lead arsenate dust at 8c per pound. The reason for this large profit is to protect ourselves on this material at the end of the season. So you will see, gentlemen, we are able to reduce the expenses to the shareholder to at least one-third on matters of that kind and that means the man can use more, or it means he can use less and live better, but it does mean he has that much more money to handle one way or the other.

I am going to refer for a little time to the matter of fertilizer. I listened with a great deal of pleasure when Mr. McKenna said he purchased some 2,000 tons of fertilizer. Now we had a good deal of difficulty in connection with fertilizer and possibly our experience would help you. In the fall of 1910 and early part of 1911 we decided we would require from 1,000 to 1,500 tons of fertilizer; that was our initial year. We sent our General Manager to Boston to see if he could not purchase direct from the different fertliizer concerns; they turned him down in New York. Before returning home he went to Baltimore, he had to buy 2,000 tons and had to charter a Norwegian steamer and bring it to Windsor, N. S. Once there the ice was broken and manufacturers sought our trade and were willing to supply our requirements at jobbers prices.

I noticed the remark in a previous speakers address that acid phosphate would be sold for less next year. I think it would be quite difficult to do that next year, but in a couple of years it might be brought about. We were able to deliver it to our Companies at a price of $12.00 per ton; that is the lowest prices I ever remember this being sold in any quantity. In 1912 we ordered 2,000 tons, this year we ordered 6,000 tons of fertilizer. Once the trade discovered we were going to purchase direct, they came t ous, and they will go to you; just go on and do business and then you will find the trade looking after your business. We captured the trade in the Annapolis Valley, in the Island of Cape Breton, in Cumberland and Pictou Counties, so you see our reputation for large handlers of goods has spread and this advertises our Company. We have never yet had anybody to place their finger on our supply department and say, "We can purchase cheaper elsewhere." You have to hold your people together, you must give them commercial benefit, because co-operation can only be worked out by receiving a benefit therefrom. Some of our people received a benefit, then turned around to us and said, "We can sell apples and get more than you can." They sold to some Ontario purchasers and we saw the people go away without paying these parties for their goods. We sold our apples and got our money. Our object is to give good value in selling and our object in buying is to buy as low as we can and handle the article at as small profit os possible, consistent with business. We do everything on an absolutely cash basis. We take a note signed by the Directors of every Subsidiary Company and in that way we are able to do business on a basis of 6%. If we want $500,000 we pay 6%, but we take absolute protection from our membership. We allow our 23 Companies to give us a Director's note, with interest at 6% and $1.00 a ton added to the first cost. A month after the goods arrive, when we get all the fertilizer for the season, we take a note for four months (it may be renewed until the people get something for their products) and that is carrid on and paid for from next year's crop. Every year on the first day of April every dollar's worth of paper we carry is paid up; we absolutely enforce that rule. Only one year we carried over $17,000, through an error on the part of an official. But we make it a rule that everything is paid on April first and then we start over again; if you do not do that you have trouble, you get into financial difficulties, but in this way we are able to obtain any reasonable credit we require from our banks and give absolute satisfaction to our members, which is the greatest asset of the business man. Very often the one whom he helps the most does not remain his friend, because he has to embarass him to get his pay. Instead of doing that, we say you must pay up when the bill is due, so that we have so far, on every occasion, every year, had a balance in every Depart ment on the rigt side of the ledger.

In the first place we had a special act prepared for the organization of a Subsidiary Company, which enabled five or more members to gather together, and we registered free of charge. Now the amount of capital required by a susidiary company, if they erected a $5,000 warehouse they would incorpoate for $10,000 and have half of that subscribed; they might pay up $1,000 or $2,000 and put up the rest; that the principle on which our subsidiary companies are organized. During the seven years our organizations have every warehouse paid for.

I have tried to instill in the minds of our people this one fact, that when organizing they should commence to pay on their own subscribed stock; if it were only 5% a year or 10% a year, they should pay something every year. We did this, with the result that the United Fruit Companies of Nova Scotia and its subsidiary Companies are pretty wealthy at the present time, but if they look back and see the small savings effected, they wil lrealize how this has come about.

Co-operation in Nova Scotia has been a wonderful success, it was the first organization that was ever able t ohold for more than five years any body of our farmers together. We have had all kinds of things started, I have been interested in them myself—but not one of them is in existence today, with the exception of the Farmers' Nnion of Berwick, which is a Joint Stock Company and run for profit.

Now I do not presume to give you gentlement advice, I have given you a history of our workings. I have been educated only in the common schools, I have not been in college, for which I am osrry, but I am going to say this, that our people have imbibed during the last seven years a lot of horse sense, or common sense. They have learned that their first and best interest is thmeselves; they have learned to cut out a lot of jealousies that existed in the meeting. We call a Directors' Meeting of 43 people, and our Board of Management of 5 more. We have had five or six or seven meetings during the past two or three years and we have never had an unkind word spoken or an unjust criticism passed,—what we deo invite is stranght, honest criticism. Our meetings have become businesslike because the people have become educated to the fact it is to their interests to conduct business along business lines. We have a few companies who try to make trouble; we pay no attention to them, but let the majority rule,—that is one thing you must do—let the majority rule.

I hope if you become a co-operative company, working for the benefit of the individual you will not get too deep into politics—that is a matter for you people to work out for yourselves. As far as we in Nova Scotia are concerned, we steer absolutely clear of politics, we do not say one word about that, we simply pay attention to our business of marketing the produce of the people and getting the most we possibly can for it, of purchasing their supplies and giving them to the people at the least possible price, and they realize the benefit they derive from it—otherwise the business we started with about half a million dollars in the first year would never have grown tot what it will be this year, closely approaching two million dollars—which is the largest year we have had

I hope that we, the Agricultural interests of Nova Scotia, of New Brunswick and of every province in Candaa will ere long realize the fact that they are the ruling body, that they are the people to hold the balance of power and that by wise and judicious judgment they can do more toward levelling the interests of Canada than can any other profession or trade in existence at the present time. We are independent enough, but we cater too much to individuals. If we gave our organization every effort possible we would be very much better than to go on finding fault with a man because he is making money. If a man gets 25c per bbl. more for his goods, that is his business; but, when we stop it, that is our business.

We purchased for this year's supply in seed nearly 40,000 bbls. of grass seeds. I am going to give you a little tip on seeds. When the United Fruit Companies came into existence in Nova Scotia seeds that were on sale in nine-tenths of the merchants places were No. 3 seed; there might have been an occasional quantity of No. 2. We made a study of the seed situation. We had Mr. Moore, of the Seed Department, of Truro, make our selection of 150 samples of different seed. We purchased the best grade of No. 1 seeds we could purchase, and a great many of you know that there are three or five different grades of No. 1 seeed. A man might buy No. 1 seed for $18.00 and he might buy it for $10.00, so I say exercise the very best judgment you possibly can in connection with the selection of seeds.

Gentlemen, I thank you for your very kind attention.

Peas and Oats

(Experimental Farms Note.)

Oftentimes the failure of the regular hay crop or the necessity for an increased amount of forage is the cause for much speculation in determining a practical means of providing for the deficit. As an emergency crop there is none more suitable than a mixture of peas and oats. In fact, it is a valued dual purpose crop with those who have had experience with it since it is equally suitable for soiling, hay silage and grain purposes. The classes of crop, namely peas and oats, making up the mixture are admirably adapted for growing together.

They both have the same seasonal and climatic requirements and mature in about the same number of days. Besides the oats support the pea vines which facilitates the harvesting and curing of the crop.

At the Central Experimental Farm and several of the branch Farms and Stations this crop has been utilized extensively as a soiling, silage and hay crop as circumstances demanded. It is usually grown as a catch crop wher the hay has failed or in a regular rotation of, first year hoed crop, second year peas and oats seeded down to clover and, third year, clover hay. Exception may be taken to peas and oats as a nurse crop which is ordinarily justfiable where the crop is allowed to ripen forr grain. On the other hand, where the peas and oats are cut in the gren stat thus being removed early in the season, the disadvantage as a nurse crop for clover is practically eliminated. In the experience of the Experimental Farms the stands of clover on areas having peas and oats as the nurse crop, are practically equal to other stands of clover grown with nurse crops of wheat, barley and oats.

The cultural treatment of the soil for a crop of peas and oats under regular cropping conditions is similar to that for ordinary grain crops. Fall ploughing, disced thoroughly in the until a deep, mellow seed-bed is prepared, proves most satisfactory. Sown as a catch crop where new seedings of grasses and clovers fail, a fairly satisfactory seed-ben may be prepared bp either shallof ploughing or by thorough discing, depending on the compactness and nature of the soil. IOlder meadows or exhausted sod areas can only be prepared for crop by ploughing and discing. In sowing, the ordinary seed-drill is used. The peas and oats should be mixed thoroughly before being placed in the sed-box of the drill and from time to time as sowing goes on the mixture should be stirred with the hand. Otherwise the peas will work down through the oats and be sown first, leaving the uast part of the seeding almost pure oats. The most suitable proportions of the mitxure are equal parts by weight, sown at the rate of at least 3 bushels per acre. Suitable varieties include Golden Vine and Prussian Blue pea and Banner and O.A.C. No. 72 oats.

Cutting for soiling may take place before pods form on the pea vines and the oats begin to head. Saved as hay. cutting begins as soon as pods are formed and the oat kernels are in the milk stage of growth. This is also the most suitable stage at which to cut for silage. If the crop is not required for any of the foregoing purposes it mal be allowed to ripen to be harvested for grain. Both grain and straw make good feed.

The feeding value of pea and oat hay is high, standing very close to alfalfa and equa to red clover. As silage it is excellent, although it yields less and the cost of production is greater than corn ensilage.

This accommodating crop, so suited to varied conditions, is bound to become better known and more highly appreciated on a greater proportion of Canadian Farms.

Gleanings From the N. S. Dept. of Agriculture

CLOSING DAY AT THE N. S. C. A.

Last year the day was beautiful and the Assembly room at the College completely filled for the closing exercises. It was still war time, and the dominant note in every address was efficiency in war. The address that sticks in the memory was the classic given by Dr. Jas. Robertson. This year the weather was about the worst Nova Scotia could produce; the Normal students were away on Easter holiday, and only a comparatively small number outside the immediate College constituency were present. The exercises, however, were of the same high order, and the addresses of even greater human interest.

In outlining the work of the year Principal Cuming took occasion to pay a fine tribute to the men who had served overseas, and especially to those who had fallen. 150 men who had been students at the Colelge since 1905 had enlisted; 20 fell on the field of honor; 2 won the Military Cross; 2 the Military Medal; 20 received commissions, and several had been mentiond in despatches.

The principal also referred in terms of appreciation to the students who had gone quietly to work as citizens and farmers in the various communities, and the wholesome and stimulatin effects of their lives on the district in which they live.

The first visiting speaker was Mr. D. A. Cameron, K. C., M.P.P. for Cape Breton, a man who has already made his mark in his profession, in politics and recently as the very efficient chairman of the Greater Porduction committee. After fitting reference to our citizen soldiers, and to the movement toward a well considered memorial policy commemorating those who had fallen, Mr. Cameron spoke impressively on personal characted as the basis of good citizenship and the mose effective factor in any real reconstruction.

Col. the Rev. John Pringle, D.D., was the next speaker. Dr. Pringle's name is a household word from Bonanza to Sydney. Everybody knows him and he knows everybody. He never seems to forget a name or a face. A prince of story-tellers, he was at his best. The call of the new day to play the game, to preserve a keen interest in education and every other factor making for good citizenship, to be worthy of their ancestry and comrades, stirred the students to outbursts of applause, and will not soon be forgotten It was a characteristic message from this big, manly citizen of the world.

Brief addresses were given by Dr. Soloan of the Normal College, and by Mr. Ward representing the returned soldiers who have been study at the College of Agriculture in the recent months.

The following is a list of the graduates and prize winners:

Scholastic Diplomas

Douglas Archibald, Newtown, Guys. Co., N. S.
Robert Bishop, Greenwich, N. S.
Philip Bishop, Greenwich, N. S.
Fred Johnson, Greenwich, N. S.
Wm. T. Perry, Butternut Ridge, N.B.
Alex S. Palmer, Berwick, N. S.
J. L. Stoddart, Stoddartville, N. S.
Fred Wasson, Young's Cove Road, N. B.
Walter Wright, Central Bedeque, P. E. I.
Harold W. Colpitts, Lewisville, N.B.

Diplomas

Antoine Leger, Richibucto Village, N. B.
Sylvio Martin, Caron Brook, N. B.
Donald Rogers, Hopewell Hill, N. B.
Earle Weir, Centre Rawdon, N. S.
John Irvin, Point de Butte, N. B.
Alvah McEwen, St. Peters Bay, P.E. Island.
S. W. B. Muir, Shelburne, N. S.

Prize Winners

Governor General's Medal for highest standing in Senior Class—Philip Bishop, Greenwich, N. S.

Prince Edward Island Cup for best judging of Seeds.—Douglas Archibald, Newtown, Guysboro Co., N. S.

E. H. Cox prize, $5.00 worth of books for senior making the highest standing in subjects pertaining to the feeding, care and management of live stock.—Harold Colpitts, Lewisville, N. B.

E. H. Cox prize, $5.00 worth of books for junior making the highest standing in subjects pertaining to the cultivation of the soil.—George Wood, Carters' Point.

FIELD CROPS COMPETITION

The prize lists for the Nova Scotia Field Crops Competitions are now going to press. Those interested and wishing to have a copy should write to Mr. F. L. Fuller, Truro, N. S. In addition to the usual prizes for seed wheat and oats a new department is being added this year in a series of prizes for seed clover. The present high prices should stimulate production of this commodity. There are at present two hulling machines in the Province, one privately owned, and one owned by the Government which is at the disposal of groups of farmers who grow clover anywhere in Nova Scotia.

There is is also a special prize list this year for the best acre of turnips, for which the Halifax Board of Trade generously donated the sum of $200.

It should be carefully noted that in order to qualify ofr entry in the Field Crops Competition for 1920 in wheat and oats it will be necessary to use registered seed on the field to be entered. The first steps toward fulfilling this condition should be taken now.

TESTING SEED

A very striking demonstration of the necessity of being sure of the vitality of the seed grain was recently made at the College, Truro, N. S. A certain dealer had imported a quantity of No. 2 Canadian Western oats for feed purposes. The grain looked so good that he thought it a pity to feed it when it might be used for seed. Wishing to make himself sure he forwarded a sample to the College for germinaation test. Only 20% germinated. Had this man depended on appearances and sold or used the oats for seed, it is easy to imagine the resulting stand of grain, with only one seed i nfive capable of growth under the most favorable condition. The buyer of such grain for seeding purposes would be paying just five prices for his seed.

The incident brings into prominence one of the matters to which the College has been repeatedly calling attention recently, i. e., the necessity of our farmers depending less on imported seed, and giving more attention to the growing and cleaning of their own seed grain. Our own Maritime season is much more dependable for the production of seed of strong vitality than that of the West. . Besides, it is now well proven that the acclimated article is more reliable than that which is grown under different conditions. But the immediate lesson for this season is that tests should be made of seed grain. Plant say a hundred seeds in a box, and keep conditions of moisture and warmth as nearly natural as possible, then count sprouts.

THE SCRUB BULL

The big piece of work now ahead of breeders of both beef and dairy cattle is the improvemenut of the stock in these Provinces. A single instance of its importance may be given. The average milk production of the Nova Scotia cow is about 3,500 lbs. per year. In the Holstein herd at the College, Truro, there is not an animal with a milk record of less than 14,000 lbs. per year. The scrub eats as much as the thoroughbred. Enough said.

The scrub cow is the daughter of the scrub sire, the greatest obstacle in the way of stock improvement. The Nova Scotia Farmers' Association at its annual meeting in Truro last March unanimously passed a resolution asking for the local Government to enact legislation for the control of the scrub bull nuisance. An Act was accordingly introduced in the legislature for this purpose. Unfortunately for the live stock interests strong opposition developed, and the Bill got the three months' hoist.

A new Bill, however, is to be introduced immediately, much of th same character ,except that its operation is to be confined to the districts in which there are agricultural societies in operation. Since the demand has been very strong from such societies for such a law it is presumed that this bill will go through. Nevertheless live stock men throughout the Province should take advantage of every opporunity of pressing it, and should urge their representatives to stand behind it. This Bill, while for the present limited in its operation, will prepare the way for more widely effctive measures later on.

AN OBJECT LESSON IN CO-OPERATIVE DAIRYING

A fine demonstration of the co-operative principle was recently given at the Scotsburn Creamery. After a short series of meetings at centers where patrons could readily be grouped, delegates from each of these communities on the invitation of the management gathered for a two days' conference at Scotsburn, N. S. The supervisor of cow testing, Mr. H. R. Brown, and Dairy Superintendent W. A. MacKay, of Truro, were present.

The whole two days were spent in investigating and observing the processes in every branch of the work, the first day more particularly on the scientific detail of weighing, pasteurizing, churning and the various mechanical tests. The second day the whole plant was in operation and 2,100 lbs. of butter manufactured. This is only an ordinary day's work at this season of the year.

In the evening the delegates and th general public of Scotsburn gathered in the Hall, and fine addresses were given by Messrs. Brown and MacKay on Herd Improvement and Feeding of the Dairy Cow, respectively. A most interesting talk was given by Miss Tina J. McCarthy, the travelling Rural Science Teacher. It was felt by all that the whole conference will have lasting effect in fostering co-operation between the Creamery Company and its patrons, promoting the interests of both and creating a feeling of confidence and good fellowship that is wholesome for all concerned.

A HINT TO SHEEP MEN

While all kinds of live stock products bring the farmer higher prices than in pre-war times, probably none has shown such an advance as those of the sheep flock. One result is a considerable increase in the sheep population of the Maritime Provinces. No one need be afraid of over-doing it. There is abundant room in the fields and barns of these provinces for a vast increase yet, as well as a very greedy market for wool and mutton.

With the revival of interest in the sheep industry has come an improved system of marketing the wool. Last year approximately 80,000 lbs. of wool from Nova Scotia alone were sold through the Canadian Co-operative Wool Growers, Ltd., and on the average those who marketed their wool through this organization realized 10c per pound more than those who sold in the ordinary way.

Plans are now being laid by this association for a much larger business this year. Depots for the buying and shipment of wool will be established at advantageous points all over Nova Scotia. The director of the enterprise for Nova Scotia is Mr. S. A. Logan, of Amherst. The Canadian Co-operative bought wool last year in every province of the Dominion and will doubtless do likewise this year on a still arger scale.

There is some uncertainty, of course, as to the price wool will bring this year. Probably it will be slightly lower than last year, but in any case it will be far above pre-war prices. It will pay owners of sheep to keep in touch with the co-operative representative in their district. Information may be had at any time from Mr. S. A. Logan, Amherst, N. S., The N. S. Department of Agriculture, or the head office at 128 Simcoe St., Toronto.

USE OF CLOVER, GREEN OATS AND VETCHES FOR SILAGE

We wish to impress upon the live stock men of Eastern Canada the necessity of making plans to have sufficient green forage crops available to fill their silos in case their corn crop is not up to the standard, as happened last season.

We do not for one moment wish to discourage the raising of corn, as corn is one of our most valuable forage crops in many section of Eastern Canada. Corn is also a crop that is very useful for the cleaning of our fields of weeds and putting the soil, if cultivated properly, in the best of shape for the succeeding crop.

But in Eastern Canada corn is very uncertain in certain sections on account of the late frosts in spring and early frosts in autumn, which prevent its maturing sufficiently to make the best silage. However, there are other crops that thrive and do very well in these districts and that make the best of silage when harvested at the proper time. One of these is our red clover plant which makes very palatable and nutritious silage. If the first cut of clover is made about the last of June for hay, the sceond cutting can be utilized very nicely for the silo, and another point in favor of using the second cutting for silage is that it is very often difficult to dry it sufficiently to make the best of hay at this late season.

Oats and vetches can also be grown very successfully for silage; ;sow at rate of two bushels of oats of a strong growing stiff straw variety such as Storm King or Alaska, one peck of spring rye, and one-half bushel of vetches per acre, cut in autumn as soon as beginning to show any signs of turning. This crop can be cut with a binder or with a mowing machine and raked and put into silo as soon as possible after cutting, as it will conserve better.

Our experience at the Lennoxville Station has been that there is more milk in clover, oats and vetches silage poudn for pound than in immature corn. Clover silage is much relished by stock and has proven very useful in conjunction with other feed for hogs.

In using clover or oats and vetches for silo it is best, if possible, to run through cutting box and harvest before the cron, as the weight of the corn on top will cause it to settle properly and keep it in the best condition possible.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

Contract rates on application.

June 10-24

MAY 6. 1919

HONOR THE BREEDER

Stockmen are born, not made; yet how many of the efforts of these born stockmen are veiled behind the moneyed man who buys his honors in the exhibition ring. There is a wide difference between the value of the work of the patient breeder and that of the buyer who exhibits his stock. The former has to make the needful dollars by parting with his stock, but the price he gets falls short of the reward he deserves for his best and successful efforts. He is the chief corner stone in the industry and the hallmark of quality should be stamped on his efforts with some publicity.

Fair managements would broaden their basis of usefulness by recognizing with an honorarium the breeder of the champion animal or any outstanding winner. The imported article could be exempted, but every Canadian bred animal, whether horse, cow, beef steer, sheep or pig, that comes out on top should carry, with its honorable career, the name of the successful breeder. Wherever this policy has been adopted it has given renewed vigor to the industry. It has encouraged the young aspirant stockman around the small farm, where many of the best stocks, in the history of every breed, have had their origin.

The buyer of stock for exhibition purposes is also an adept at feeding for exhibition; he rarely considers the conserving of vitality, and sterility amongst his stock, is common. The encouraging of this element in stock-showing makes the Fair ring the scrap heap of much good blood, and an untimely end to the patient labors of the studious breeder. The beef classes of cattle have many of these specimens, as well as sheep and pigs. It is pleasant sailing for the hard fed mare, that fails every time to have progeny, to gain prizes under such show-ring conditions, that gives her the coveted honor in a breeding class, but what value is she to the breed she represents? The holder of the reserve honor should get the blue ribbon when the champion fails to prove fertile. This method of allocating honors to whom honor is due has been fruitful of much good in the Royal Show in England and Highland Show in Scotland, and the overfed breeding animal has disappeared from the ring; where also the man who breeds the winner can share in the fame attached to its history.

DEMONSTRATION FARMS

For many years there has been a greater or less demand for Demonstration Farms here and there over the Province. This demand has largely lost its point through the fact that in most communities there are already one or more farms which may be regarded as models. These have been developed in the best possible way,—through the initiative and industry of men who have availed themselves of all possible information from Colleges, Agricultural Depts. and other sources. While conditions on these farms may not be ideal, they embody a good working adaptation to local circumstances, and offer a valuable lead to their neighbours.

There is a saying in the Book that is worthy remembering in this connection; "Wisdom is before him that hath understanding, but the eyes of the foolish person are in the ends of the earth." Every farming community can profitably take advantage of the intelligence and progressiveness of its own members. One man is successful along one line, another along another. If the experience of each leader in his own line is made available to the whole community through Associations, etc., the demonstration idea will be perfected.

OPPORTUNITIES

Opportunities are like flashlights. They suddenly reveal us to others and also to ourselves. We all long for opportunities. We have a feeling that they might disclose some very fine qualities and a high order of ability which we think we possess, and which the world has not discovered. But the trouble with opportunities is that they seldom come properly labelled. Anyone would grasp them if he knew what they were, but they are quite likely to appear to our vision either as insignificant trifles or as disaster and misfortune. It is in the courage that grapples with these last and determines to get the best of them that many of earth's greatest opportunities have been disclosed.

A MARITIME DAIRY SCHOOL

An important resolution was discussed and passed unanimously by the Daiyrmen's Convention, recently held at the College of Agriculture, Truro, calling for the establishment of a Maritime Dairy School. For the past three years the staff of the College has conducted such a school for a short term and on a small scale. The work done has been so valuable and so highly appreciated that there is now a strong demand for its extension. The expense has been provided by the three Provinces in Conjunction.

It is the universal feeling among the Dairying interests that the best method of expending this educational movement is by the organization of one central, well equipped institution. Such a school would probably arrange a two years course, and would do much better work than would be possble in several small, ill-equipped and short term schools.

The terms of the resolution referred to indicate one central school situated at the College of Agriculture, where there already is much of the necessary plant in the way of provision for instruction in Chemistry and bacteriology as well as a herd of cattle to supply the practical demands of the course. The expense would be borne by the three Provinces. In this section of Canada, where the Dairy Industry is sure to be the dominant agricultural interest of the future, the project will doubtless find as hearty a support as it subsequently received at the Prince Edward Island Central Institute and the New Brunswick Farmers' and Dairymens' Association.

TAXES

Friends and neighbors, the taxes are indeed very heavy, and if those laid on by the government were the only ones we had to pay, we might the more easily discharge them; but we have many others, and much more grevious to some of us. We are taxed twice as much by our idleness, three times as much by our pride and four times as much by our folly, and from these taxes the commissioners cannot ease or deliver us by allowing an abatement.

Have you ever estimated the toll taken from your income by scabby and diseased potatoes being used for seed; by smut in grain; by early and late blight; by vermin on your sheep and cattle; by not castrating your ram lambs; by slacker cows; by allowing your farm machinery to rust and rot in the open instead of housing them properly and keeping them well painted and oiled; by the extra steps you have to take owing to badly planned arrangements and by many other leaks that are within your own power to remedy.

THE VALUE OF GOOD SEED

Most of our readers fully realize the tremendous advantage of good seed. The proper time, of course, to select good seed is by personal inspeetion before the crop is cut. At that time one can see length of head, average number of kernels per head, uniformtiy of crop, quality of straw, etc., and consequently be able to make a much better selection. This, however, is advice that many may be able to put in force next fall for the following year's seed, but, for the present, all that can be done is to select good, plump grain of a high germination test and as free from weed seeds as possible. If it does not come up to a reasonably high standard, make free use of the fanning mill, and use the small kernels for feed. It is exceedingly important that the very best seed possible be secured. so make the very best selection possible from that which is available.

* * *

Advertising in the Maritime Farmer never fails to give results. If you have quality livestock for sale give it a test. At two cents per word per insertion you will find it the quickest, cheapest and most effective way to sell and get a good price. Every issue is read by 12,000 farmers.

* * *

The good producing cow wants a square, full ration every day, and she can't get it from pasture—as the seasons run. The good farmer neither confines himself nor his horse, nor even his hog, to the food that grows each summer day. Why should he his cow? He will pay dear for it if he does.

* * *

The common cow is the cow for the man who is not a better dairy man than she is a dairy cow.

* * *

No bull over twelve months of age should be allowed to go without a ring in his nose.

* * *

Fall fresh cows generally yield from 10 to 15 per cent. more milk in a year than spring fresh ones.

* * *

Wealth does not come by the most diligent saving, but by the most diligent producing. Men and nations who pinch the pennies hardest are never the richest.

THE FARM WELL

Of the many types of wells in use, the dug well is perhaps met with most frequently. This is especially true where the ground water lies at no great depth and occurs in no clearly definde channels but seeps through the soil slowly, so that a well of comparatively large diameter is needed to provide storage. It meets the requirements of a large reservoir from which considerable water may be drawn at one time, as is sometimes necessary when watering cattle, filling again when the drain upon its water ceases. It also has the advantage of cheapness, in that it can be dug with ordinary farm equipment and farm help, without the employment of outside labor or machinery.

Unfortunately, with all its advantages, the dug well is likely to furnish the most unsafe water supply of any of the wells in use. It is the most open to contamination. The two principal sources of contamination are the impurities, insects, small animals, etc., gaining entrance through the covering and upper few feet of the curbing, which is frequently of loose masonry construction; and impure surface water, carrying filth in solution, as the washings of the farmyard during and after a heavy rain, seeping down into the well. Again, unfortunately, the handiest location for the well, near the back door or barn, puts it in a position where it is most likely to be polluted, so that too much precaution cannot be taken to insure its protection, a pure water supply being a long step in the direction of countryside health.

Choosing a Site for a New Well

In digging a new well, therefore, particular pains should be taken in choosing its location. Mention has been made in a previous paragraph of the ground water from which the well receives its supply. This is not standing water in the soil, as many suppose but really a river or drainage system, nearly as well defined as the system with which we are familiar on the surface, moving slowly toward the sea by a more or less direct route. The principle differences between these underground water supplies and the surface streams are the size and the rate of flow, the undergrond water flow being more nearly comparable to an immense stream which is so filled with gravel and other debris that no water appears at the surface, but through which it gravitates slowly on its course to the ocean. The source of this ground water is of course the yearly rainfall, and this may work through the soil for a long distance before it is tapped by a well. In general, the flow of these underground currents follow the surface contour of the land so that advantage of this fact can be taken when locating a new well, putting it in a place where the water that it is likely to receive comes from an unpolluted source.

In connection with the locating of a new well some men take into consideration a so-called "safety distnce" varying from 100 feet in the case of a tight soil, as clay, to 200 feeet or more in the case of the more open soils, as the sands, through which water percolates more rapidly. By this is meant that if the well is located the above distances from a source of pollution of water will be purified before reaching it by filtering through the soil. As a matter of fact water is so purified, but the distance is more or less a problem of judgment rather than one of actual measurement, because of so many factors of slope, type of soil, source of suspected pollution, etc., that no measurement with a rule can give reliable results.

Some men in digging take the depth of the wells as the "safety distance" but in the case of a shallow well, as a dug well is likely to be, this is obviously unreliable.

As already pointed out, a well is contaminated chiefly by material and impure surface water entering the top and upper few feet of the curbing. This is shown to be a fact in the case mentioned, the influx of surface water being so great in this case that it caved in the well by washing away the supporting earth back of the wall. It is said that the filtering of water through 10 feet of clean earth will purify it. Of course this does not apply to extraordinary cases, but only to cases where the pollution is slight. A method then of making an ordinary well safe is first to secure a location on high ground, or at least on ground the surface of which slopes in all directions from the well. The addition of a tight concrete cover, which because of its durability is really the cheapest material from which to build such a platform, tightly joined to a watertight curbing which should extend down into the ground for at least 10 feet and preferably further, prevents polution from the top. This watertight curbing, as will be discussed later, may be made from concrete or tile with cemented joints. As a further precaution against the entrance of surface water, tightly rammed and puddled clay should be placed around the upper 10 feet of the curbing, and should extend out in the form of an apron. This will prevent waste water from the pump from seeping down the sides of the curbing and re-entering the well, as well as preventing the entrance of any surface water by the same route. It, if properly made, is insurance that all the water entering the well has passed through at least ten feet of soil.

Th Material to Use in Building

The choice of concrete or tile for the well lining rests largely on the use to which the well is to be put and on the type of soil in which it is dug. If dug in a type of soil in which there are clearly defined underground water pasages, and the well taps these so that there is a constant stream of water flowing through the well, insuring a supply of water, the tile will make a satisfactory lining, as storage room for water is not a requirement. If in another type of soil, where the water was obtained largely by percolation or seepage, the tile might still be satisfactory if the well was to be used for no other purpose than household use. On the other hand, if the well was to be used for watering cattle or other purposes, where a heavy draft was likely to be put upon it for short yeriods of time, a larger diameter would be needed to intercept more of the ground water as it seeped along, and to provide a larger reservoir for storage, increasing the diameter or depth being about the only means of increasing storage capacity, as the water cannot be made to rise above the water table.

The method to be used then in repairing a well will depend upon the points just outlined above, particular attention being paid to the features making for pure drinking water and safety, as from the description given of this well it is quite evident that considerable surface water found its way into the well before its purchase. Building the top of the well up above the surrounding land and then grading up to it is effective in turning away surface water when the ground slope is wrong in the first place. Ventilation should be provided by a pipe bearing a screened opening facing downward, as shown, and if these precautions are taken in locating, digging and constructing, as well as cleanliness about the well, remembering that it is a drinking vessel and keeping it as clean as the pail with which hte water is carried to the hous, as good good a suppyl of water as the country will afford may be expected.

EVERY FARM SHOULD HAVE A SILO

There are thousands of farmers in this country who need a silo and have needed it for several years. They either have not answered this question or nave answered it in the negative, or it may be they have postponed the matter, or felt that they could not afford the investment. The silo should be considered a part of the necessary equipment of a dairy or stock farm, for it has to do with the success of the business.

The largest item of expense in keeping a herd of cattle is the feed bill, and therefore it is the first question dmanding our attention. Labor comes next, but the feed bill is generally twice that of labor, and the silo strikes directly at this overhead cost of feeeding making a big saving in the cost of feeding. It also produces better young stock and increases production.

Practicaly all of the great milk and butter records of the country are held by cows that have been fed silage. Large, growthy, vigorous young stock are easily and cheaply obtained by the liberal use of silage. If you have a silo you may need to answer this qustion in order to find if you need another. It is surprising to find on our best stock farms not one but three o rfour silos.

It is difficult to determine accurately the saving made by the silo when the cost of the ration is considered for so many conditions enter in which makes a variation in the result, but it is safe to assume that from ten to twetny-five dollars can be saved in the cost of feeding a cow one year by the use of the silo.

It is also safe to say that with silage the cost of butter fat can be reduced from six to twelve cents per pound and the cost of producing a hundred pounds of milk from thirty to fifty cents a hundred pounds of beef from a dollar to two dollars, and a hundred pounds of mutton from seventy-five cents to a dolar and a half. With such a saving it can easily bt figured tha ta silo would soon pay for itself where ten or twelve cows are kept.

The convenience of the silo is well recognized by men who have given it a thorough trial. By properly arranging the silo and the barn it is possible for one man to feed forty cows in thirty minutes, and the work can be done with ease and without the use of a horse or wagon, The silo can be considered a time and labor saver.

The silo is the most economic equipment for the storing of forage. When space is considered, eight times more feed can be kept in a silo than in a hay mow. It would be difficult indeed to construct a barn which would hold two or three hundred tons of forage, while it is an easy and simple matter to put up a silo that would hold this amount. There is less deterioration in holding over silage than in holding over dry fodder. I have seen excellent silage that was six years old and this same silage was fed successfully to cattle that seemed to relish it more than new silage.

The silo stands ever as an insurance against forage failures, especially damages by frost and drought. Any kind of feed which can be grown can be saved in the silo though it may not mature a grain crop. It makes farming more secure and warrants a cheap and excellent forage for all kinds of stock in both winter and summer seasons.

The heavy bulky feed on a stock farm should be produced at home, and the concentrates, such as grain, and mill feed, can best be purchased. With the fertilizer, which is always found on the stock farm, big crops of forage can be grown. It is not uncommon to see corn fodder produce as much as twenty tons of silage per acre. This feed grown close at home, can be rushed into the silo and the bulky ration for the years is supplied.

Silos should be provided for both winter and summer. Consider carefully the earning of your pasture. Six times more feed can be furnished on pasture ground if it is put in the form of crops and ensilage. The pasturing of land worth a hundred dollars and up per acre is questionable.

The summer silo in many sections is needed more than the winter. It is better to build two or three silos than one big one. Like canned fruit, make your silos so you can feed off a good layer each day and thus keep the forage fresh and sweet.

Why a silo? can be answered by considering all of these items, considering the cost of production, the cost of your land, the earning power of your farm. Scientifically stated, the silo will lower the cost of digestible cargo-hydrates, it will make your acres earn more, your stock earn more, your work easier, your storage greater, the production of your cows higher, your faem richer, and with these advantages you will derive more pleasure and profit from your labor.

SEED TREATMENT FOR SMUT OF OATS

The oat crop of Canada is estimated at about 400,000,000 bushels. The average loss from smut, usually placed at four to six per cent., means the destruction of about 20,000,000 bushels, a loss which can easily be prevented by seed tratmnt.

Oat smut is easily recognized as it destroys the kernel and hull and sometimes the chaff, changing them to a black dusty powder composed of millions of spores, which are scattered by the wind and which lodge on the sound oats in the vicinity. When this grain is sown the smut spores germinate and infect the young seedlings. The smut develops inside the growing plant and reduces the kernel to a mass of spores instead of sound grain.

The object of seed treatment is to kill the spores lodged on the grain. The safest and best method is to treat the seed with a solution of formaldehyde by one of the following methods, given out by the Experimental Farm, Ottawa.

Dipping Method.—Mix well one pint of formaldehyde (formalin) in forty gallons of water, putting the solution in barrels or casks. Put the seed in coarse bags that the solution will readily pass through and drop into the casks allowing to soak for about five minutes till every grain is wet. Remove the bags and allow to drain on slats into the casks as the solution may be used several times. Then pile the grain on a clean floor and cover with sacks of canvas for two or three hours. Dry the grain by spreading on a clean floor and stirring now and then. Sow the grain as soon as it will run freely or if necessary to store, dry thoroughly as damy seed will mould or sprout.

Sprinkling Method.—Pile the grain on a clean floor or grain wagon and sprinkle with the solution, using a sprinkling can, shovelling the seed fro mone pile to another so that each kernel will be thoroughly wet. About a gallon of solution will be required for each bushel of grain. Cover the grain as in dipping method and dry.

Do not allow the wet grain to freeze as it might injure germination. When the grain has been treated and is damp and swollen, the rate of seeding should be increased about three-fourths of a bushel per acre. Any bags or receptacles used for holding the treated grain should be disinfected in the solution of formaldehyde.

Dry Method.—This method has been recently introduced but requires more care. A solution consisting of one pint of formaldehyde to one pint of water is sprayed on the grain while it is being shovelled over on a clean floor or canvas. A sprinkling can must not be used, as a sprayer that will deliver the solution in the form of a mist is necessary. In this method there is no danger of freezing and no drying is required. It should not be used for wheat except in an experimental way. One quart of the solution will treat about 50 bushels of seed.

BEAN ANTHRACNOSE

By G.C. Cunningham, B.S.A., Officer in charge Field Laboratory of Plant Pathology, Fredericton, N. B.

Bean anthracnose, sometimes called pod spot, and incorrectly called rust, is a very common and destructive disease, particularly in Quebec and the Maritime Provinces and, some years, in Ontario. It is almost invariably present but not always severe enough to be noticeble. It attacks the stem, leaves, pods and seeds, causing dark spots, resulting in greatly decreased yields and an inferior quality of crop. It is caused by a microscopic fungus carried chiefly by the seed. It can be greatly reduced, if not controlled, by taking proper precautions.

Symptoms

Filed Appearance: When infected seed has been planted and the weather is wet or cloudy, the disease develops rapidly. Skips or vacant spaces occur in the row where the seed has failed to germinate or where the young plants have died and completely disappeared. Frequently considerable portions of the row may be marked only by bare stalks, or small, sickly plants bearing a few faded leaves.

However, an abundance of foilage does not necessarily mean freedom from anthracnoses. Infection under favorable climatic conditions may spread rapidly and become serious even after the plants are quite large; under such conditions it is not noticeable without carefully examining the stem, leaves and pods.

On the Seed: The seed may be slightly or badly affected and in se vere cases appears rotted or weathered. Slightly infected seed may show little or no discoloration or only a light brown stain. Badly infected seed shows well marked, dark brown or black spots varying from the size of a pin head to a degree where the whole seed is involved. In such cases the seed coat is usually ruptured and the spots more or less sunken, with a grayis centre, indicating that the invading fungus is producing fruiting bodies. Badly infected beans are unfit for table consumption and even the slightest spot injures the bean for seed purposes.

On the Cotyledons (fleshy seed leaves): Diseased seed invariably produces diseased cotyledons; one or both may be affected. The lesion or canner is of a brownish color with a definite outline and involving all or part of the cotyledon. If damp weather pervails the diseaser area enlarges and the pink spore-masses of the fungus are produced in abundance.

On the stem: The fungus may spread from the cotyledon to the stem, infecting and destroying the growing poit, leaving a bare stalk. If the stem infection takes place early and conditions are favorable, the stem may rot off at the surface of the ground and disappear entirely. Infected stems show well-marked, brown or black, elongated streaks. Severe stem infection practically prevents the plant from setting any pods.

On the leaves: The disease appears on the lower side of the leaves as black streags on the mid-rib and veins. This condition sometimes results in a puckering of the surface. The leaves, particularly when the petiols are affected, turn yellow and fall prematurely, leaving small, weak plants incapable of producing a maximum crop.

On the Pods: The lesions are most noticeable on the pods, at first as minute, dark-red spots, which rapidly enlarge and become esunken or saucer-shaped, with a definite dark-red or black border. The sunken appearance disappears as the pods become mature and dry. In other cases, when infection has been extensive, the numerous smal lesions coalesce, giving the pod a brownish, black-pitted appearance. The centre of the larger spots may be brown, black, pink or grey, depending o nthe age-condition of the fungus.

Causal Organism

Bean anthracnose is caused by the fungus Colletotrichum Lindemuthianum Saac. and Magn. The vegtative mycelium consists of hair-like tubes, at first colorless but later brown; invisible to the unaided eye except in clusters or tufts such as are sometimes seen in the centre of old lesions. A net-work of this mycelium develops beneath the epidermis of the infected spot causing the characteristic appearance of the disease, and later produces small erect branches or conidiophorees bearing the elliptical or kidney-shaped spores, stuck together by their mucilaginous envelopes. In masses the spores are pink or cream-colored. These spores are scattered bp numerous means to other parts of the plant and even considerable distances to other plants. If there is a a supply of moisture, they germinate immediately by sending out one or more germ tubes, which enter the healthy tissue, and in turn its mycelium develops, producing a fresh lesion and a new generation of spores.

Life History

The fungus passes the winter in a dormant condition in the seed, in diseased bean refuse, or in the soil, but chiefly in the seed. The bean seed upon germination is pushed above the ground, but halves forming the cotyledons or rudimentary leaves, which serve as a primary source of food during germination and until the plant has become established. Consequently, infected seed invariably produces infected cotyledon. The moisture taken up by the seed during germination is sufficient to enable the fungus to commence growth and produce spores. These spores are brushed off on the soil as the cotyledons push toward the surface, and immediately come in contact with the young tender stem, ready to germinate and attack the new plant. The cotyledons remain on the stem for a considerable period after the true leaves have appeared and, if weather conditions are favorable such as plenty of moisture, and not too much sunlight, the spores are produced in large numbers from diseased cotyledons. These are washed down the stem bp rain and spread by other means to all parts of the plant and adjacent pants. The cotyledons thus serve as the nest, in which is produced the new generation of spores and from which they can most easily be spread.

These spores now attack the leaves and stem, setting up disease and weakening the plants. By the time the pods are setting, more spores have been produced and these new lesions and the pods become infected. The fungus mycelium attacks and penetrates the pods causing serious injury and finally enters the new crop of seed in which it lives in a dormant condition until germination takes place the following spring.

The fungus is also capable of wintering over in diseased stems, old pods and eaves, and if these are applied to the soil the new crop infection will take place. Probably it is capable of living on organic matter in the soil for a few years and, if a reasonable rotation is not practised, infection from soil-carried organisms map be expected.

Loss Caused by the Disease

A conservative estimate of the decreased value of the Canadian bean crop, caused by this one disease, is probably over 10 per cent. In some localities and during some seasons it is undoubtedly much more; many fields have been examined where the crop was reduced by from 50 to 75 per cent. The total annual loss on the dried bean crop alone amounts to over 300,000 busels and to this must be added the loss caused to string beans which are grown in every garden. This loss is manifest in several ways. The first and most important is decreased yield, which loss map vary from little or nothing to almost a complete efailure. Beans from badly and even moderately infected fields are not suitable for seed purposes unless very thoroughly hand-picked, and even then diseased beans are sure to escape. Probably the growers of string beans, where the green pods are used for table or canning purposes, suffer the greatest proportional loss as infected pods are unmarketable.

Spread and Development of the Disease

The disease, as previously stated, is propagated from year to year chiefly by planting diseased seed and to a lesser extent by using infected bean refuse as fertilizer, or failure on the part of the grower to practise a reasonable crop rotation. The spread and development of the disease in the field is influenced to a large extent by the prevailing climatic and soil conditions. During a bright, dry season little damage is caused, but during wet, cloudy weather it spreads and develops rapidly. This is because of three conditions: (1) The spores have a mucilaginous envelope which holds them together when dry and retards their being carried from the diseased lesion to healthy plants by the wind. (2) The spores are produced most abundantly during wet weather. (3) They can germinate and gain entrance to healthy tissue only when moisture is present.

Beans grown on low, wet, or poorly drained soil are usually more severely injured than those grown on high, dry soil. This is probably due to a greater amount of moisture in the atmosphere surounding the plants and to the fact that an abundance of soil moisture necourages an early rapid growth of the fungus contained in or on the infected seed during germination. The same condition is brought about even on high soil if the seed is planted too early and during wet weather.

Healthy leaves become infected by brushing against moist, spore-bearing lesions. Spores are carried from one plant to another by cultivating machinery and on the hands of the picker. It is therefore advisable to avoid working among beans when the foilage is wet.

Control Measures

Numerous suggestions for the control of anthracnose have been made from time to time but these have failed, partly because of their inefficiency but largely due to the fact that the growers have failed to put them into practice carefully and continuously. The chief point to keep in mind is that diseased seed produces diseased plants and those serve as a source of infection to healthy plants. It would seem that a combination of control measures might give the best results. The various steps are here described separtely but should be practised collectively.

Pod Selection: Disease-free seed can be most easily obtained by gathering sound pods from a field as nearly disease-free as is available. In selecting these pods care should be taken to select from plants which appear resistant to the disease, high yielders and true to the desired type.

As an additional precaution, the pods should be immersed in one of the folowing solutions for two three minutes:

(a) Copper sulphate, 1 lb., in 80 gallons of water.

(b) Formalin, 1 pint in 30 galoins of water.

(c) Corrosive sublimate, 1 oz. in 8 gallons of water.

The pods are then thoroughly dried, threshed and the seed stored in a clean sack; care should be taken to avoid reinfection of the seed. If it is impracticable to select enough pods to supply seed for planting the whole of the next year's crop, sufficient should be selected for a seed plot.

Seed plot: A seed plot is nothing more nor less than a plot on which is propogated desirable seed, of pure variety, true to type, high pielding and free from diseases, in sufficient quantity to supply seed for planting the main crop the following year. The very best seed obtainable should be secured for panting the seed plot. This practice has given excellent results with other crops and might pro fitably be practised by seed growers.

Seed selection: Where pod selection has not been practised, and even if it has, the beans should be carefully hand-picked, removing all discolored, spotted, shrunken, or inferior seed before planting. This will not remove all the infected seed but will materialy reduce the amount. Several preliminary experiments in careful hand-selection gave very promising results, not only as a control for anthracnose but as a means of eliminating inferior seed and disease in general.

Seed treatment: Treatment of seed beans has not niven wholly reliable results, probaby due to the fact that the organism causing the disease penetrates deeply into the tissue, and cannot be easily destroyed without injuring the germinating quality of the seed. Nevertheless, after the seed has been carefully hand-selected, treatment will help by destroying slight surface infections. Preliminary experiments with various seed treatments indicate that soaking the seed for three minutes in any of the solutions given above reduces the amount of disease and increases the yield.

Copper sulphate and corrosive sublimate are poisons and beans treated with them should not be used for table purposes or fed to animals.

Spraying: Spraying beans for the control of anthracnose has not proved entirely successful; the disease can be checked to some extent but not controlled. When great importance is attached to freedom from disease such as on a seed plot or where beans are being grown for seed purposes, thep should be sprayed with a 2:2:40 or 4:4:40 Bordeaux mixture, the first application being made when the plants are quite small, and succeeding applications at intervals of one week or 10 days.

In addition to the above practices, the grower should observe the following precautions:—

1.—Select a marketable variety known to show resistance to the disease in his neighborhood.

2.—Plant on dry, well-drained soil.

3.—Avoid the use of bean refuse as fertilizer on the bean field.

4.—Plant beans in the same field not ofetner than once in three years.

5.—Avoid cultivating, picking or doing any other work among the beans during wet weather.

UNITED DAIRYMEN UNITED DIRECTOR'S MEETING

The Board of Directors of the recently organized New Brunswick Dairymen United met in the creamery building, Sussex, on Friday, April 25, with President F. G. Hughson, Corn Hill, presiding.

The chief business of the meeting was consideration of a redraft of the provisional constiution which had been adopted at the organization meeting of the 7th of March. In addition a set of By-Laws, Rules and Regulations were also considered and approved. Several resolutions were put through and arrangements made to pay the first instalment of dues to the Canadian National Dairy Council.

NATIONAL DAIRY COUNCIL

At a meeting of the Eastern Executive of the National Dairy Council held in Ottawa on April 16th, the President, Mr. E. H. Stonehouse, expressed much gratification at the progress of affairs up to the present and was very hopeful as to the future, for the response from the various Provinces shows much enthusiasm and a readiness to lend all the financial aid required. A full report was presented by the Secretary as to the appointments which have been confirmed by the organizations in the various Provinces.

A joint session was held with Mr. Alexander and Mr. Donaldson, members of the Cheese Commission of last year, and the following resolution passed:—

WHEREAS: The exportable surplus of Canadian cheese has during the past two years, owing to lack of shipping facilities, and to difficult financial conditions brought about by the war, been purchased by a Cheese Commission, the price being set in England;

And WHEREAS: Producers fully realize the necessitp for the above arrangements, which have on the whole been satisfactory and the work of the Cheese Commission is much appreciated;

And WHEREAS: The season of cheese production is now opening in Canada and cheese producers are laboring under a feeling of uncertainty regarding intended pdans for disposing of this season's surplus;

And WHEREAS: There seems to be a felling among producers that cheese jrices in Canada should be on a par with prices for the exportable surplus of cheese which mya be available in the United States.

BE IT RESOLVED: That in the opinion of the Executive Committee of the National Dairy Council now in session, representing the various dairy interests of Canada, that should it be decided by the Government that it would be in the best interests of the cheese trade to again have the exportable surplus handled by the Commission, that the price set for cheese in England should be at least equal to that which may be obtained by the United States for cheese exported to the United Kingdom, otherwise we are of the opinion that the Government should immediately take steps to arrange financial conditions and proper shipping facilities for exporting to the United Kingdom and that the market should be left open to private trade.

RESOLUTION: "That Mr. W. H. Dunn of the Borden Milk Company, Montreal, be accepted as representative of the condensary interests on the Council."

RESOLUTION: "That the Milk Power Industry be represented on the Council, and that the appointment of a representative be left to themselves, and that the Secretary be asked to communicate at once with Mr. Trainer."

RESOLUTION: "That the President draft a letter to the Hon. T. A. Crerar, Minister of Agriculture, making a formal request for the grant."

RESOLUTION: "That the action of the President and Mr. Bingham in engaging Counsel and in bringing delegates to oppose the increased rates on cream at Ottawa, Toronto, and Montreal, be approved of and that the expense incurred be paid out of the funds of the Association."

RESOLUTION: "That the thanks of the National Dairy Council be extended the Dairy Commissioner for getting out such a complete report of the National Dairy Conference and distributing is so widely."

RESOLUTION: "That the Government be requested to appoint a representative dairyman on the Dominion Trade Commission."

RESOLUTION: "That the question of appointing a permanent Secretary be left in the hands of the whole executive at a meeting to be held in Winnipeg on a date to be fixed by the President, and not later than July 15th, and that in the meantime Mr. Geo. A. Putnam be requested to continue in his present office as acting Secretarp until the meeting of the whole executive is to be held."

RESOLUTION: "It having come to the ears of the executive that the railways purpose increasing the rates for shipment of milk by baggage. The President and Mr. Bingham to file an objection with the Railway Commission with regard to the proposed increase and to engage Counsel, if necssary."

RESOLUTION: "Mr. J. Walter Jones, Charlottetown, P. E. I., be appointed Chairman of the Eastern Publicity Committee."

THE LEAF RUST OF OATS AND THE BUCKTHORN

(Exeprimental Farms Note)

The Leaf Rust of oats, sometimes called the Crown Rust, is more or less common all over Canada. In some uarts of Eastern Canada it is quite common and causes considerable injury to the oat crop.

This rust is caused by a fungus which develops in the tissues of the leaves and the leaf sheaths of oats and produces on the surface of these parts during the summer masses of yellow spores. These spores are readily carroied about by the wind and spread the rust during the growing season. Later the leaves become dark brown or black due to the masses of dark colored winter spores which are formed just beneath the skin or epidermis. The stem of the oats is not attacked by this rust. If the rusted leaves are exposed to the weather during the winter, the masses of dark spores begin to grow when the warm weather comes in the spring and produce a number of small spores. These wil lnot infect oats but if they reach the buckthorn they attack the leaves and young parts. In a few days masses of yellow spores are formed chiefly on the under side of the leaves. These spores are readily carried by the wind and if they reach growing oats can start the rust. In this way the buckthorn is an important aid in the spread of the leaf rust.

The buckthorn is a shrub or small tree which is planted for ornamental purposes in hedges and lawns. The leaves are ovate in shape with a saw-toothed margin and prominent veins. The berries are black when ripe and remain attached during the winter, the black shining bunches of berries being quite noticeable. The fruit is very unpleasant to the taste. This shrub readily escapes from cultivation and may be found growing wild in many places. There is therefore great danger that it may become common and thus prove a more serious menace than at present to the oat crop.

The leaf rust of oats can attack wild oats and some grasses but this matter has not been fully studied. It is possible that this rust has other means of living over the winter and propagating itself in the spring than by the buckthorn, but whether this is so or not is unknown. It is certain, however, that the buckthorn is an active agent in starting the leaf rust in the early summer on the oat crop. Rust may be found on the buckthorn throughout Canada usually in June before it is found on oats and grasses. This is the great danger of the buckthorn. It starts the rust early and thus gives it time to become widespread before the maturity of the oats.

As it is crtain that the leaf rust is a serious enemy of oats and as there is no doubt the buckthorn aids in spreading this rust, active measures should be taken to destroy the buckthorn and to prevent further planting. It should be replaced by other harmless shrubs which are just as satisfactory for ornametal purposes.

POTATOES—SEED AND TIME OF PLANTING

(Exeprimental Farms Note)

The yield of potatoes throughout Canada would be very much increased if everyone who grew potatoes used seed of the strongst vitality, free from disease. While the variety used is important, the quality of the seed often makes much more difference in the yield than variety.

Seed potatoes from a crop which grew vigorously until the tops were cut down by frost in autumn usually give much better results than those from a crop where the tops dried up in the middle of summer. There are parts of Canada where the former conditions obtain, as a rule, and it from such places that the most vigorous seed is usually obtained.

In 1918 the best seed of the Green Mountain potato yielded at the rate of 387 bushels per acre while the poorest seed yielded only 57 bushels per acre at Ottawa. In the case of Irish Cobbler, the best seed yielded at the rate of 616 bushels per acre while poor seed only yielded 26 bushels per acre, a remarkable differnce. Just as striking differences have been obtained in othr years.

Each grower of potatoes should aim to have a full stand of plants in the field and to have every pant a vigorous and healthp one. There is often a large proportion of misses in potato fields and a still larger proportion of weak and diseased plants which lessen the yield enormousyl.

Experiments have been tried in diffrent parts of Canada to determine the best time to plant potatoes for highest yields, and from these experiments and the experince of the best growers, the following dates are suggested as being the best: Prince Edward Island, June 1-7; ;Nova Scotia, June 1-15; New Brunswick, June 1-15; Quebec, May 15 to June 15, depending on the part of the province; Ontario, May 1 to June 15, depending on what part of the province; Manitoba, May 10-15; Saskatchewan, May 10-24; Alberta, May 10-24; British Columbia, April 1 to May 15, depending on what part of the province. The tendency has been in most places in Canada to plant later than is desirable for highest yields. From results obtained the following general recommendation is made:

Where the spring is early and autthe spring is early and summers are the spring is eary and summers are dry, plant early. Where the spring is late and autumn frosts are late, early planting is not so important. Where the spring is early and autumn frosts are early, plant as soon as the soil is dry enough.

HOW MUCH BARLEY SHALL WE SOW TO THE ACRE

(Experimental Farms Note.)

An experiment has been conducted at the Experimntal Station, Charlottetown, during the last three years, to determine the most profitable amount of barley to sow per acre, as shown by its own development and yield, together with its effect upon the yields of the subsequent crops in a four years' rotation, rotated as follows: 1st year Mangels, (stable manure applied to this crop in the rotation once in four years at the rate of 20 tons per acre); 2nd year, Barley, 3rd year, Clover Hay, 4th Year, Timothy Hay.

The barley was sown at the following rate per acre, namely, 1½ bushels, 2 bushels, 2½ bushes and 3 bushels per acre, and all seeded down alike with 12 lbs. Timothy and 10 lbs. Red Clover per acre. The records from each of these plots were kept separately throughout a four year rotation, for all of the various crops and the figures given below constitute a three year average yield of the crops in the above mentioned rotation. Where the barley was sown at the following rates: 2, 1½, 2½ and 3 bushels per acre, the yields of grain were 34 bushels 26 lbs.; 34 bushels 37 lbs..; 34 bushels 28 lbs.; and 32 bushels per acre; the yields of clover hay were 2333 lbs., 1700 lbs., 1620 lbs., and 1707 lbs.; the yields of timothy hay were 2560 lbs., 2080 lbs., 1640 lbs., and 1500 lbs. per acre and the yields of roots (mangels) were 413 2/5 bus., 380 3/5 bus., 272 4/5 bus., and 322 3/5 bushels per acre respectively.

It will be seen from the preceding that the best results were obtained throughout the rotation by sowing the barley at the rate of 2 bushels per acre. It will be noticed that the yield of grain varied only slightly with the amount of seed sown, not sufficienty to leave any of the plots appreciably poorer in consequence of the amount of fertility taken from the soil by the barley. Therefore the increased yields of hay can only be accounted for by the nurse crop of barley at the rate of 2 bushels per acre being of the right thickness to give the young timothy and clover plants the proper protection from different climatic conditions, such as direct sunlight or drying winds, which would cause the evaporation of the soil moisture or a transpiration from the tissues sufficient to cause the drying up or even the death of the young plants. Furthermore, the increased yield of roots results from the more luxuriant growth of clover and timothy sod that has been ploughed under, and which, upon its decomposition, not only augments the supply of humus, but also sets free the nitrogen that has been stored, by the nitrogen fixing bacteria, in th enodules on the roots of the clover, in a readily available form for the following crop of roots.

THE VALUE OF GOVERNMENT STATISTICS

Last winter, when many farmers were writing to the the N. S. Department regarding the disposal of their surplus potatoes, the Secretary for Agriculture took a trfip to Boston for the purpose of ascertaining if any further market could be obtained for the Nova Scotia crop. On his return he stated at several public meetings that the U. S. Dept. of Agriculture reports indicated a shortage of 30,000,000 bushels in the potato crop. At the time when he was there the shortage had not shown up. . Some of the dealers were of the opinion that the unusually mild winter had made possible the continuous shipment of supplies from outside poits, supplies heretofore held up until spring. The same bureau reported a large shortage in the Southern States which ordinarily furnish a heavy supply to New England and adjoining States. The forecast of these reports has now materialized. Boston is already buynig in Nova Scotia and will continue to do so until the surplus in this Province is cleaned up.

Go over your harness, halters ropes, etc., to see that all breaks are repaired and all weak places strengthened to prevent breakage. Possibly your hay rope was broken or a strand was cut. If so, make a long splice or weave in a new strand.

HORTICULTURE.

GROWING BEETS AND MANGELS

There is no one crop grown upon the farm that requires greater care in the preparation of the seed bed than sugar beets or mangels. It costs just as much to raise a half crop of roots as a full one, because the soil requires the same preparation, the same cultivation, thinning, hoeing, etc. If a good crop is grown, the financial returns will be good, but if only a fraction of a crop is raised, it may be very expensive by the time it is harvested. In view of this, it is easy to understand why every care should be given to preparing for the crop, land that is best adapted to the growing of sugar beets and mangels.

The first requisite to successful culture of beets is proper drainage, for the reason that their roots will not thrive in a wet soil nor in the absence of oxygen. It is obvious then that beets should only be planted in well-drained soil if best results are to be obtained.

Soils in which the water table is near the surface are not desirable for sugar beet culture. When free water is present near the surface of the soil it limits the space in which the beets have to feed; renders the soil cold and wet in the spring; reduces the air content of the pore spaces; retards the liberation of plant food; causes the available plant food to go into a weak solution; retards the action and growth of beneficial micro-organisms, and reduces the soil's capacity for water. All this tends to keep the roots from going deep enough in the soil to insure maximum gorwth as the roots of the plants are forced to develop in the surface layer of soil, which is incapable of feeding the beets properly throughout the growing period. In short, the soil area from which the beets must derive all the plant food necessary for their proper growth and development is limited by the height of the soil's permanent water table. As the season advances and a period of drouth arrives, the water table is lowered and the roots of the plant not having made a downward development will be unable to obtain the necessary moisture from the lower soil strata.

The method of preparing land for sugar beets or mangels will depend somewhat upon the crop grown the previous year. Most successful root growers recommend planting roots after sod, ploughing the ground after the hay is removed and cultivating at frequent intervals throughout the summer and fall. Such a method of cultivation cleans the field of weeds and conserves moisture, thus insuring a heavier crop. However, it's too late to prepare now for this summer's corp in that way; but if a field is not too weedy and was fall ploughed, it may be selected, manured, and planted to roots, and if properly worked a good crop may be expected.

The seed bed must be prepared thoroughly. There is no crop grown upon the farm that will repay any extra work in preparation as well as a crop of roots. The soil should be worked deeply so as to allow the roots to penetrate to the proper depth, then rolled to make it firm, and the top few inches worked ilke a garden. This insures quick germination and rapid growth, and permits the plants to get ahead of the weeds and keep there.

In obtaining the proper state of tilth the roller and the drag harrow are the most useful implements. After the soil has been disked once or twice as deep as possible, use the harrow to pulverize the surface, and the roller to firm the soil and crush the small lumps on the surface. If the soil is not thoroughly drained or is weedy or shallow seeding in drills is to be preferred; on clean, rich soil flat cultivation may be practised. Plant in drills about thirty inches apart, using plenty of seed and rolling after the planter. Run a wheel hoe close to the rows as soon as the plants can be seen, give frequent horse cultivation throughout the summer to keep down the weeds and prevent evaporation of moisture. Thin as soon as the plants will allow, leaving about eight inches between them, and pull in October before the frost comes. It is not wise to pull too many beets at one time as they deteriorate rapidly if exposed to a bright sun or high winds.

A great many farmers think that the growing of roots is too expensive a proposition for the returns to be had from them. That is a false conception, as most successful root growers will testify. They claim, and with ample proof, that root growing is one of the most profitable crops grown upon their farms. Neither are these men all engaged in the raising of live stock. Those who are situated near a sugar beet factory make good money by growing beets for the manufacture of sugar, while others who are near towns or railway stations grow turnips for table consumption. These are all profitable investments, but it is on the live stock farm that roots are most important. They seem to supply a certain "something" which puts that extra bloom on the animals and which cannot be supplied by any other feed. The greatest live stock country in the world (Great Britain) grows large areas of roots and leading stockmen of that land claim that their extraordinary success has been due to the heavy feeding of roots. Canadian stockmen could do nothing better than to copy their methods in that respect and grow more roots, which, together with corn silage, makes an ideal ration. Sugar beets and mangels are heavy yielders, are better for dairy cows than turnips or swedes, and deserve a much larger place in the rotation of the dairy farms of Central Canada.

Buy New Machines

FOR years you have been cheerfully complying with Government request to save materials by repairing your old machines rather than making replacements. Now that the need for this has passed, would it not be real economy to buy new machines and be assured of uninterrupted service at a time when a break-down would mean serious embarrassment and loss.

Deering and McCormick Mowers, Rakes and Tedders and International Side Delivery Rakes and Loaders

are designed to remove all elements of chance from hay making. The mower lays the hay in even swaths down meadow and hayfield. The left-hand side delivery rake follows the mower closely, touching the heads first (not the stems), piling two swaths at once on the clean stubble. This insures proper and speedy curing. Every hay grower should become familiar with the combined side delivery rake and tedder, which has become one of the most popular haying tools. It can be instantly adjusted for raking or tedding.

International loaders leave the field clean, lift hay over 10 feet and do **not** thresh off blossoms and leaves. Sold with or without forecarriage.

You will find that the local agent has just the size and style of International Harvester haying machines your work requires. See him, or write for catalogues. Order early.

Grow Strawberries for Profit

Do you know that one Farmer in New Brunswick sold nearly $5000 worth of berries from five Acres? That another Farmer sold over $8000 worth from a little over ten acres? These results are not exceptional, any good farmer can do as well who will give his attention to the most profitable crop that can be grown in the Maritime Provinces. We can supply Plants for the professional Strawberry Grower, for the man who grows an acre or two as a side line to general farming or for the family garden. Good strong well rooted plants are more than half the battle in successful strawberry culture. Start right. Don't take plants from an old bed or from the side of the rows as a gift. All Farmers know that poor seed means a poor crop. Dunlaps, Warfields and Beder Woods, $4.00 a thousand; Sample, Glen Mary and Dr. Burrell, five dollars a thousand.

GRADING OF POTATOES AND ONIONS

Editor Maritime Farmer:

Of recent years a great deal of consideration has been given to the question of onion and potato grading. Many large marketing organizations have recommended that steps be taken to have legislation passed which will render compulsory the grading of these commodities. Individual growers, as well as wholesale dealers, have made similar recommendations.

During the four years of war, however, the Dominion Department of Agriculture, to whom these suggestions were made, deemed it wiser to direct every effort towards increasing the production of vegetables in order to save wheat, rather than to do anything to interfere with production. Fro this reason the question of compulsory grading has been left in abeyance.

About a year ago optional potato grading laws were put into effect and were enforced by the Dominion Fruit Branch during the past season. These were satisfactory as far as they went, but as they affected only shippers who graded their potatoes No. 1 or No. 2 and did not affect those who preferred to market ungraded stock, the benefits resulting from the system were of necessity limited. With the cessation of hostilities, and with all lines of commerce and industry endeavoring to adjust themselves to the present era of reconstruction the question has again presented itself, and must now be carefully considered on its merits.

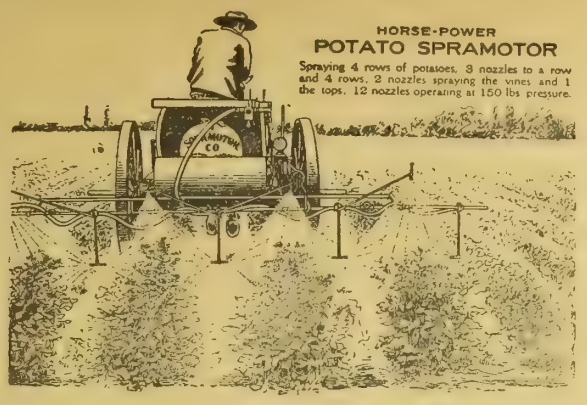
Looking at the matter in a general way, primary consideration should be given to the benfits which would result from legislation compelling growers and shippers of potatoes and onions to grade these commodities in acocrdance with Government standards. The greatest of these benefits would probably be the mutual understanding which would be created between buyer and seller. In the past there have been many instances of cars of vegetables being refused at destination on account of declining markets; the result has been that the shipper, often far removed from the consignee, has been obliged to accept a lower price in order to dispose of his goods without further difficulty. There have been probably as many instances in which consignees have received goods of inferior quality, and have been obliged to enter in extensive negotiations in order to effect a satisfactory adjustment. These and similar difficulties would be greatly lesened by a system of compulsory grading subject to Government inspection.

The marketing of very small and inferior potatoes and onions would also be prevented and a large quantity of suitable stock feed, and which should never leave the farm, would thereby be kept out of our large consuming centres. In this connection it is important to note, however, that requests have been made for provision, in the wording of the necessary legislation, for the marketing of new potatoes during the months of July and August. There is a considerable demand for these potatoes, which are smaller in size than would be permissible in graded stock.

Compulsory grading would also do much to aid Canadian shippers in foreign markets, where competition is now very keeen. At the present time, for instance, Canadian potatoes are shipped in large quantities to American markets and to the West Indies and come into direct competition with the United States potatoes which are graded. This has, in the past, affected the sale of Canadian-grown stock and Canadian shippers have been obliged to accept proportionately lower prices than those paid to American shippers.

In order to obtain an expression of opinion upon the subject of compulsory grading, the Dominion Fruit Branch has cmmunicated with practically all the leading shippers, associations and wholesale dealers in Canada, pointing out to them the possibility of legislation being introduced. The replies received have been many, and the expression of opinion has been practically unanimous in favor of a compulsory grading spstem. The proportion of dissension has only been about two per cent. and this smali minority is probably influenced by purely local conditions. It is therefore quite apparent that the introduction of compulsory grading would meet with general approval in all parts of the country.

It is interesting, in this connection,



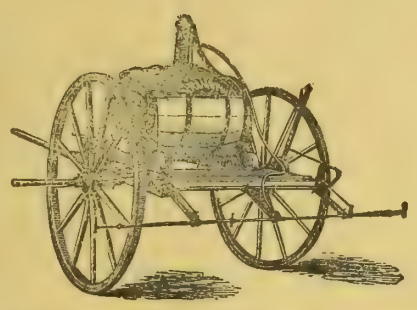
HORSE-POWER
POTATO SPRAMOTOR
Spraying 4 rows of potatoes, 3 nozzles to a row and 4 rows, 2 nozzles spraying the vines and 1 the tops, 12 nozzles operating at 150 lbs pressure.

A Profitable Addition to Your Farm Implements

FEW things add more to a farmer's earning capacity than a good, efficient spraying machine---and the world's best outfit, proven in tests against all comers is our own Canadian-made

Spramotor

It isn't a SPRAMOTOR unless we made it



We ship Spramotors all over the world and make a machine for every purpose — hand outfits, barrel machines, knapsack, cart, horse-operated and power machines—prices ranging from $7 to $400. They do perfect work in all spraying tasks, field and orchard, painting, witewashing, disinfecting, cattle spraying, etc.

FREE Valuable up-to-date treatise on spraying mailed free on request. Wirte for your copy today.

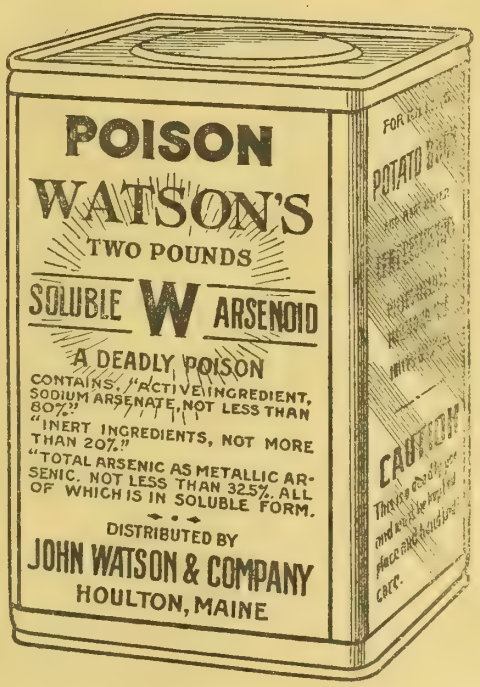
WATSON'S SOLUBLE ARSENOID



POISON
WATSON'S
TWO POUNDS
SOLUBLE W ARSENOID
A DEADLY POISON
CONTAINS: "ACTIVE INGREDIENT, SODIUM ARSENATE, NOT LESS THAN 80%"
"INERT INGREDIENTS, NOT MORE THAN 20%"
"TOTAL ARSENIC AS METALLIC ARSENIC. NOT LESS THAN 32.5%. ALL OF WHICH IS IN SOLUBLE FORM."
DISTRIBUTED BY
JOHN WATSON & COMPANY
HOULTON, MAINE
CAUTION

One pound does the work of two of Paris Green, and does it better. It's first cost is far less than Paris Green. WATSON'S SOLUBLE ARSENOID is now recognized to be far the most efficient insecticide for killing potato bugs and other leaf eating insects.

It must be used with bordeaux mixture, and not otherwise. It is very adhesive and does not wash off easily.

FREE OF DUTY except the war tax.

On July 22, 1918, the Canadian Customs at Ottawa issued an order removing the duty on WATSON'S SOLUBLE ARSENOID except the war tax, and this order applies only to WATSON'S SOLUBLE ARSENOID, manufactured by John Watson and Company, Houlton, Maine. This endorsement speaks for itself.

WATSON'S SOLUBLE ARSENOID has been on the market for a number of years and is used almost exclusively in Aroostook County. If your dealer cannot supply you, write us direct, and give us the name of your dealer.

to refer brifly to the history of the Fruit Marks Act which was introduced into Canada at a time when fruit packing was probably at its worst stage. During the past eighteen years the improvement in the grading and packing of Canadian fruit has been very marked, and at the present time the enforcement of the Fruit Marks Act consists largely of maintaining the standard of grades which have been effected since the original introduction of these laws. It must, therefore be expected that the grading of potatoes and onions, while of immediate benefit to all concerned, will increase in value with each succeeding year.

Before any steps are taken in the direction of legislative measures, and before definite grades are defined, the views of representatives from all Provinces will be obtained and every consiideration given to the whole question from every standpoint.

SEED SOWING AND EARLY CARE OF VEGETABLES

(Experimental Farms Note)

The time of sowing the seed and the early care of vegetables are very important factors in the successful growing of them. The seed of some kinds of vegetables will germinate at a temperature and under certain conditions of moisture at which other seeds will not germinate and will sometimes rot.

Seeds of beets, carrits, lettuce, onions, parsnips, peas, radishes, kohlrabi, garden cress, salsify, spinach, parsley and leeks can be sown as soon as the ground is dry enough in the spring so that it will work well. The seeds germinate at relatively low temperatures and the plant will stand considerable frost without serious injury. Other vegetables such as cabbage, cauliflower and celery will also stand frost but these are usually started in a hotbed in order to save time in the field.

Vegetables which require higher temperatures than the above in order to grow wel and which are injured by light frosts are beans, corn, cucumbers, melons, potatoes and squash.

Seed of late cabbage is not sown until late in May but it will endure frost, and seed of Swede turnip should be sown late when required for the table.

nI orderf to obtain plants subject to light frosts, which are well advanced before being set out and to save considerable time the field melons, egg-plants, peppers and tomatoes are usually started in hot beds.

Frequently lack of germination of seed is blamed on the quality of the seed, whereas it may be due to the way the seed is planted or to the rotting of the seed in the ground when certain kinds of seed have been sown too early. Small vegetable seeds are often planted much too deeply. For the smaller seeds one-quarter of an inch for the smallest to one-half of an inch for those a little larger is deep enough. If planted much deeper the seed may germinate but the shoot does not reach the surface of the ground and the tiny plant dies. Peas, corn and beans are planted about two inches deep. In very loose soils, the surface of which dries down more than those fairly compact, slightly deeper planting may be necessary.

When the seed has germinated great care should be taken to ventilate hot-beds carefully. When the young plants come up, the frame should be kept sufficiently aired by raising the back or higher part of the sash to prevent the plants from getting spindly or weakly, when they are apt to damp off. When young plants are grown in a window in a house they are often very thick in the pot and if in the sun with the surface soil wet ,they are very liable to damp off or scald. They should be thinned out and transplanted as soon as possible. Great care should be taken when ventilating a hot-bed when the wind is high in cold weather as cold wind blowing directly on the plants will injurethem. A board should be put at the end of the sash to break the force of the wind.

Plants which have been growing in a hot bed or cold frame or in the house should be exposed to the open air for several days before they are set in the field, protecting them as usual at night, as if set in the field without hardening off in this way they are much more liable to be injured in cold or windy weather.

Most Accurate Ever Invented

Are you content to go on in the old-fashioned way using all your available farm help planting by hand, limiting your acreage because of labor scarcity, and keeping your help away from other pressing work in busy season?

Get an O-K Canadian Dial Planter and get your planting done accurately without seed waste and in a fraction of the usual time.

The O-K Canadian is the only planter that has the endless cup seed dropping device. It does not pick or bruise the seed. It is noted for being the most accurate system yet invented.

From the roomy steel hopper the seed is picked up by cups and deposited on revolving dial plate. This makes it simple to make any corrections necessary. Absolutely one piece of seed goes to each hill, thus making your seed go farther. Five years' tests demonstrate accuracy close to 100 per cent.

O-K Canadian Potato Planter

The O-K Canadian has equipment for correct depositing of fertilizer. Furrows are opened by two shoes. The first opens a trench to receive the fertilizer. The second shoe opens the furrow deeper, mixing fertilizer thoroughly with earth, thus protecting seed when dropped. This is correct and necessary for proper fertilizer results.

You certainly ought to get full particulars about the O-K Canadian, the machine that will enable you to put in more acreage into this profitable crop at low cost. Write to-night for free literature giving full particulars of O-K Canadian Planters and Diggers.

APPLE BUD MOTHS AND THEIR CONTROL IN NOVA SCOTIA

The apple is attacked by a number of different insects. In Nova Scotia the caterpillass of the Bud-moths are probably the cause of more loss than all the other insects combined. The Entomological Branch of the Dominion Department of Agriculture has just issued Bulletin No. 16 entitled "The Apple Bud-moths and their Control in Nova Scotia," by G. E. Sanders and A. G. Dustan. This bulletin of 24 pages gives and account of the life-histories of the four destructive bud-moths which occur in that province. The chapter on the control of

these insects discusses results obtained from spraying experiments, following which definite control measures are recommended. Useful information is also included on parasitic insects and other natural enemies. Fourteen illustrations appear in the bulletin. These show injured blossoms and fruit, various stages of the insects, etc. This publication will be of much value to apple growers in eastern Canada. It ca nbe obtained free of charge on application to the Publications Branch, Department of Agriculture, Ottawa. A technical edition of the bulletin giving scientific descriptions, etc., has also been published. This will be of special interest to economic workers. Enquiries regarding insects in general should be addressed, The Dominion Entomologist, Department of Agriculture, Ottawa, Ont."

BEAUTIFYING THE FARM HOME

The making of a rural landscape the home of the farmer is like the making of a picture. There is more than pleasure comes his way in training himself to this art of picture making of his home; there is money in it too. Increased market value will follow and this is the way to procure it.

The first thing is to have a clean-up day. Collect the scattered farm fachinery and get it under cover. Haul off to a widening gully the accumulation of tin cans, bones, buckets, brickbats, baling, wire, barb wire, etc. Remove to the roadway the bank of cinders and ashes. Collect the scattered wood pile into a convenient but unobtrusive place. Remove the dead and dying branches from trees and shrubs. Define the driveways so the traffic will be confined to a given entrance-way instead of driving promiscuously about the place. Repair the tumbledown fences or cover their ugliness with concealing vines. By the use of plantlings of some of the numerous vines, shrubs and vigorous annuals, screen from the front view the poultry yards, barn yards, outbuildings and any ugly spots of the homestead. The visitor is admitted step by step as he passes from screen to screen int othe private apartments of home grounds, just as the visitor passes from parlor to kitchen, as the relation with the household becomes more intimate.

Of all the places the farm home possesses the greatest opportunity for beautiful effects in ornamental planting. As a rule this fact is not sufficiently appreciated. In many cases no attention whatever is given to planting about the home. One reason for this neglect is the fact that the owner is under the impression that good landscape gardening about his place canont be effected without elaborate plan and larger expense. Many times Nature herself has given to the country home and its surroundings all of the main essentials of landscape beauty. Here it is necessary for the owner of a home to go to nature's more skilful production and attempt to copy her results. As we pass through fields and woodland we are attracted by the pleasing pictures that seem to be thrown together in bewildering confusion. We begin to analyze anr to differentiate out the simple principles by which Nature secures her satisfying results. We find here a cozy nook that looks so restful and quiet. There are no stiff, regular lines that put upon it the stamps of artificiality. Nature does not work in straight lines. The open grassy plot is bounded by a border of shrubs and trees intermingled with annual and perennial flowers in profusion. The shades of green and the varying flowers and fruits blend and contrast in bewitching combinations. The boundary line of the border in a beautiful irregularity suggests a coast-line with its capes and bays and peninsulas. The skyline also is utter confusion as the sky is torn by the tops of trees and shrubs of varying heights and shapes. Here a break in the border opens to view a pleasing vista stretching into the distance. There a solid mass of foilage shuts from view any ugliness that may be beyond. Here a vine covers and festoons the skeleton of a dead tree, making it beautiful even in its death. There are no harsh and obtrusive corners, but each part in the mosaic fits into its place and blends with the other parts to make the picture.

Now supopse we introduce into the grassy plot of this picture the house with its walks and driveways. What is the result? Nature has done its work well, but man has marred it. These the necessary conveniences for man but seem inharmonious and artificial even when the architect has done his best. The house rises abruptly out of the ground and stands like a sentinel that says, "Stand aloof!" I have been sent to rule you with unrelenting sway." It becomes necessary for man to use Nature's way to tie the house to the ground and break the sharp angles and lines by planting about the base of the buliding and in the background. The house must look as though it had grown up with the landscape rather than it had been superimposed upon it. Study nature's way, and go and do likewise, and you will make the country home the ideal place to live in and rear a contented people.—M. L. HAYES.

THE DRAIN OUTLET

The outlet is of the first importance in tile drainage. There must be a clear fall away from it. Submerged outlets, so-called, are no outlets. They still elave that land undrained where the tile lies below the level of the water at the outlet.

An outlet right, purchased, through another man's land, is usually worth what it costs, Protect your outlet with a concrete abutment. Screen it against the entrance of birds and animals.—Prof. H. B. Roe.

The apple-growing industry was conceded by residents in the south-eastern Ohio counties to have reached the lowest possible level a few years ago. The improvement which has been derived from the new methods of fertilizing in one county alone is estimated to have increased the apple revenue by a million dollars in eight years.

Massey-Harris

Built for Service

The real test of a Tractor is—will it do the work? The Massey-Harris Tractor has met this test and proved itself to be the Tractor built for service on the farm.

Constructed on sound scientific principles, free from any freakish contraptions, with a strong, sturdy Frame able to stand the severe strain of farm work, and an Engine with power sufficient for any ordinary farming operations. The

12 H. P. On the Drawbar **Massey-Harris Tractor** **25 H. P. On the Belt**

is just the right size of Tractor for the average farm, and is so simple that any farmer can easily operate it.

The name "Massey-Harris" on the Tractor is the farmers' best guarantee. It stands for all that is best in Farm Implements the world over, and represents over 70 years experience in supplying the needs of farmers. This long experience has enabled the makers to embody every worth while feature in the Massey-Harris Tractor, and so offer a Tractor equipped to render power for every purpose on the farm.

Also, in buying a Massey-Harris Tractor, you buy from a Company which makes both the Tractor and the Implements for use with it, and stands back of the whole outfit.

DAIRYING.

WINTER DAIRYING ADVANTAGES

(Kimball's Dairy Farmer)

Dairymen have just passed through a period of very strenuous field activities and of heavy milking with the dairy herd. Now, when field work is lax, many will be idle, because they do not fall freshen their herd. In fact, on some farms the term idleness might be used. A more even balance of the year's work can be brought about if the cows are bred to calve in the fall. The logic of this is very plain; as the work for caring for the cows draws to a close, the busy time in the barn opens. The cows will be coming fresh at that time. There will be plenty of time for giving them any needed attention, and for looking after the young calves.

Records show that under the system of having cows calve in the fall 12 to 20 per cent, more milk is secured during the course of the year. The price received is higher. Higher profits are insured, because under this management, the cows are yielding their maximum production at the season of high prices. It is true that milk products cannot be as cheaply produced on high priced feedstuffs as on grass, but the increased price and greater ease of handling the milk during the cool weather, with the subsequent saving in labor, far outweighs the advantage of the grass pasture.

Best at First

One of the greatest arguments in favor of fall freshening is that it balances the work of the farm to a nicety. The cows commence to come fresh about the time the heavy work on the farm is completed for the year, or along about the middle of November or the first of December. The dairymen is in a position to devote all his time to making the herd profitable. In this manner the farmer provides himself with productive and profitable work for the entrie year. Usually the milk flow begins to fail by the time the spring farm work opens, the dairy work is consequently lighter and can give place largely to work in the field. By June the cows start to go dry and by the time the blue grass pasture fails in the fall there is very little cow work and plenty of farm work. The dairymen, however, can make good use of the pasture while it lasts, for the cows respond to it and the dairyman is rewarded with an extra flow of milk before the cows go on their summer vacation.

It is important that the dairy cow be encouraged to do her best during the first part of the lactation period, for to a certain extent she will strive to maintain the pace set during the first few weeks. The dairymen, for this reason, should be prepared to give the cows the best of care at this time. More can be accomplished toward producing the very highest flow of milk in the fall or early winter than in the spring. This theory is based upon the fact that the cows' system becomes sluggish through the winter due to artificial feed.

In the absence of silage or roots a grain ration something like this should be used: Bran, 40 parts; ground oats or barley, 20 parts; cornmeal, 20 parts; oilmeal, 20 parts.

Most dairymen have found that it pays to make use of the scales for weighing the grain for each cow and the milk from each milking. It is usually admitted that occasional weighing is worth while as showing whether a cow is a "boarder" or not, but those who have kept a complete milk record realize the value of such a method to the feeder.

It is a safe rule to feed 10 to 15 pounds of hay, 25 to 45 pounds of silage, or 30 to 50 pounds of roots, varying the quantities acocrding to the size and capacity of the cow. In addition, one pound of the grain mixture should be fed for every 3 or 4 pounds of milk produced. If a cow tends to fall off in production without gaining in body weight it would seem that she is not eating enough, but if she gains in weight at the expense of production it is apparent that she needs more protein, relatively, in her ration, or—maybe she is the wrong kind of a cow. A good feeder will not permit acow to run down and become too thin. If she tends to "go too much to milk" she can stand a wider ration, that is, more fattening feeds in proportion to those richer in protein.

The profitable feeding of dairy cows consists of supplying them with plenty of well balanced, palatable feed, in suroundings which afford them health and comfort. Nature gives the dairyman a model in feeds in the month of June and this is recognized to such an extent that the very words "June pasture" suggests the ideal condition for producing milk and butterfat of the highest quality and in greatest abundance. The dairyman should therefore, try to extend these more ideal conditions throughout as much of the year as possible, and will succeed just as far as he recognizes and applies the factors which go to make up the ideal conditions.

In the first place, the common grasses supply all of the required nutrients in the proper proportions. Besides, this forage is relished by animals to such an extent that they will consume it almost to the limit of their capacities. Then again, pasture grasses are succulent, and so keep the digestive system of the animal in a laxative condition favorable for the very best action of the organs of di-

Butter-and your Separator Oil

THE delicate balance of the separator mechanism determines its accuracy of operation—its precision, completeness and speed in separating out **all the butter fat.** And this mechanical accuracy depends on correct lubrication.

IMPERIAL
Separator Oil

is manufactured to exactly meet the peculiar requirements of cream separators. It penetrates the close fitting bearings and assures ample lubrication. Does not congeal or gum. Insures easy, frictionless operation and satisfactory results with all types of separators.

gestion and assimilation. We must not forget that animals on "June pasture" are supplied with an abundance of fresh air and sunlight, not to mention pure water at will.

In practice the dairyman must adjust himself to conditions of climate, soil, location and capital, which in turn are affected by the market for products and the help available for the care of the herd. What would be wise practice for one man may be folly for another. This shows that each should think out his own problem for himself. It is certainly worth some study if he can make a pound and a half of butter where but one was proudced before—especially if the first pound was made without a profit and the extra half is nearly a clear profit

Winter dairying helps to solve the hired man problem. It makes the working of summer shorter and more regular. It provides steady work during the winter, thus keeping some of the good men from drifting to the cities..

The Only Breed

which can furnish both market topping steers and cows which are profitable milk producers, is the Shorthorn.

BUYING A COW WITHOUT A RECORD

The young farmer when purchasing dairy cattle, often experiences some difficulty in selecting cows that are good producers and pay a good profit on the investment. If it is possible to buy a cow with a record backed by the Babcock test, one is reasonably sure of the amount of butter fat that the cow will produce under favorable conditions. One is not always able to purchase a cow whose record has been proven, so other means must be used in determining whether the animal is of a desirable type or not.

First, it is necessary to learn the general conformation of the dairy type. The angular appearance, the wedge-shape and conformation and her lack of flesh all indicate heavy production. One of the essentials is that the cow has a strong constitution. It is necessary that her organs of digestion and circulation be perfect in order that the large amount of feed that she consumes may be assimilated and transformed into milk. The indications of a strong constitution are: Deep heart girth; deep roomy chest and forlegs well set apart. Her capacity for storing feed is indicated by her large, capacious barrel.

One of the most important things to consider in selecting the dairy cow is the udder. The shape, size and texture of the udder should be examined thoroughly. It should extend from front to back. One that hangs down too low is not a desirable type of udder nor is the funnel-shaped udder which does not indicate heavy production. Uniform teats, of good size and well placed are desirable. The udder itself should be flexible and of good size. Milk veins—the veins leading from the udder to the heart—should be large and branched and are indicators that the circulation is good.

Frequently, cows that have proven unprofitable to the owner, are offered at public sales and sell for high prices. One cannot be too careful when purchasing a cow under such conditions. It happens that sometimes to all appearances the cow has the correct conformation and dairy type yet it is a poor producer. This kind cannot be told until they are tried out. At the present high prices of feed it certainly does not pay to keep a cow too long that is a non-producer.

HOW TO CLEAN DAIRY UTENSILS

Most of the bacteria which get into milk come from the utensils, such as cans, pails, strainers, coolers, and separators, which have not been properly cleaned. The University of Missouri College of Agriculture recommends the following method for cleaning the dairy utensils: 1. Rinse in luke warm water as soon after use as possible. 2. Wash in hot water containing washing powder which will remove grease. 3. Rinse in clean hot water and place in live steam 15 seconds, drain and place right side up anti lsteam evaporates. On the farm where steam is not available sunning will give effective results. Drying should not be done with a cloth, but by heating the utensils in steam or in an oven sufficiently hot to evaporate the moisture. 4. Invert in a clean protected place when dry.

The Man Who Buys a DE LAVAL *Is Taking No Chances*

MOST any kind of cream separator will do fairly good work the first few months, when it is new.

But if it is a cheaply made or inferior machine, after the first few months your trouble will begin.

And the worst of your experience with such a machine will not be the fact that it wears out quickly or that it runs hard, or that you are piling up repair expense, but that you are losing a lot of butter-fat that is worth 50 to 60 cents a pound.

And that is what you really buy a separator for—to save this valuable butter-fat.

Any time you buy a cream separator—no matter who makes it or what claims are made for it—that has not behind it a long record of satisfactory service, a record that is in itself a guarantee of satisfactory service, you are taking a gamble with all the odds against you.

Why take chances at all when you come to select a machine that may mean so much in increasing the profit from your cows?

There is one cream separator that has been the acknowledged world's standard for over 40 years. It's the one cream separator that is used by the creamerymen almost exclusively. Dairy farmers the country over know the DeLaval and its sterling quality. Experience has shown them that

It is the best cream separator that money can buy

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

LIVE STOCK.

DEVELOPING DAIRY BULL CALVES

The success of the farmer and the breder in live stock production depends largely upon how well he develops his young stock. The pig breeder who keeps his young pigs coming along nicely from the time they are farrowed usually finds a ready sale for them when he is ready to sel them. Likewise is it the pork raiser who never lets his pigs go hungry that generally tops the market at the sock yards.

It is the general experience of those who breed pure bred live stock that, whther they sel privately or through the sale ring, there is no difficulty in selling the well fitted, well developed animals. They sell themselves. It is the poorly grown and illy fitted animals that are hard to get rid of.

For those who are engaged in the breeding of pure bred cattle, whether dairy or beef, it is especially essential to ralize the importance of properly developing their bull calves. Their problem is to sell young bulls. They have little difficulty as a rule in disposing of any female stock they may have in surplus, but to sell bulls is another matter. The competition is greater and as a rule more care is exercised in the choice of bulls than in the choice of female stock. It's the fellow that keeps bull calves in the best fitted condition that makes the best sales and makes them easiest.

,Dairy bull calves with good production records back of them often sell at very low prices, and others with little in the line of production records back of them sell at very high prices. The difference in price could be accounted for only in the difference in their conditions as to fitting. Among beef cattle he has seen the differnce in fitting mean a differenc of sveral hundred dollars to the selelr's pockets where young bulls were sold that were otherwise about equally well bred. The bulls sold in the same sale, had the same advantage in advertising, were of equally popular blood lines, and at birth gave equal promise as to their future development as individuals. The difference at sale time was that one breeder had properly developed and fitted his calf while the other had failed to do so.

Although there are those among both breeders and farmers who are in the market for young bulls who think more of the low price at which they may buy tha nof the kind of bull they get, the majority have learned that their chief consideration is not so much the price they pay as the kind of bull they take home with them. Experience has taught them that "The sweetness of low prices equals the bitterness of poor quality."

MILK CAN CARRY INVISIBLE DIRT

Just because you can see no dirt in milk does not mean it is clean. Dairymen try to produce clean milk, but if their precautions end at the point where visible dirt vanishes, they may have succeeded, and they may not. For dirt in milk can exist in an invisible state as well as the visible. In fact, the larger part of the dirt which gets into milk dissolves and cannot be seen, making its presence all the more objectionable.

The visible dirt in milk may be of any sort, which was attached to the cow's body, bits of soil, straw, chaff, filth, or any other foreign substance which will not dissolve in milk. It is a comparatively easy matter to produce clean milk in the spring and summer months, for the simple reason that the cow is generally on pasture during these months and when allowed to care for herself she will keep clean. In the winter, however, she is kepa in closer quarters, and it is

24 Years the same

then that the greatest amount of dirty milk is ap tto appear on the consumer's table if the producer has not given the proper attention to the cleanliness of his animals.

Keep the cow in clean quarters. Remove the manure from barn twice daily, where the animals are kept in all day. Keep the long hairs on the udder clipped back so they will not carry dirt so easily. Groom the cow twice daily, before milking. Use a small top pail. Use clean bedding only. Carry on no operation in the milking barn during milking hours which tends to raise dirt, such as feeding and sweeping. Thoroughly clean all utensils which come in contact with milk.

FOUR BULL BRANDS

The Scrub Bull.—Brand him "N.G." Sire of scrubs. Notorious cause of puny creamery checks. Supplier of filling for the worst bullwurst. Furnisher of the canner's "sinews of war." Trademark of ignorance and profitless stock breeeding. Let him be annihilated.

The Grade Bull.—Brand him "?" Sire of mongrels. Inheritor of skin-deep beauty from the pure-bred sire. Powerless to transmit definite qualities of characters. Unable to grade-up stock. Bully for bologna. Trademark of indifference and shiftless in stock breeding. Let him be cut out!

..The Pedigreed Scrub Bull.—Brand him "D. B." Counterfeit purebred. Worthless offspring of aristocratic but unprofitable ancestors. Sire of pedigreed nonentities that defrauad and disappoint their buyers. Cannot raise the level of a herd to the maximum of profit. Trademark of careless incompetence in stock breeding. Let him be butchered!

The Breed-for-performance Bull.—Brand him "O. K." Surest means of herd improvement. Possessor of breed prepotence from profitable pure-bred sires and dams. Transmitter of quality, individual excellence, performance, and every desirable attribute. Herd biulder. Profit maker. Home builder. Trademark of intelligence and progressiveness in stock breeding. Let him reign supreme.—Dr. A. S. Alexander.

THE OLD RELIABLE COW

"Is cow's milk doomed?" asks somebody referring to the announced discovery of a process by which fresh milk, of any "type" wanted, may be made from cocanut oil and powdered skim milk. We confidentlf answer "no," says the H. F. News Bulletin; and it never will be as long, at least, as human science is unable to discover what it is in butterfat that is not in any of the vegetable oils and that makes all the difference between healthy children (or young animals) and children stunted in growth and with sore eyes and skin eruptions. There is no possibility of any of the so-called "substitutes" taking the place, to any great extent, of cow's milk, because too many people have read about the McCollum experiiments and discoveries and know the vital difference between the real thing and the "substitutes." We shall not take the risk of bringing our children up on "substitutes" and even we grown-ups prefer real milk for our food so as to ensure for ourselves the benefit of its healing and waste-repairing qualities. Besides, all the manufactured "substitutes" require some cow's milk or butterfat in their composition to give them even the semblance of merit!"

PRICE REALIZED FOR WOOL DEPENDS UPON THE METHOD OF SHEARING AND HANDLING

The higher or lower values of wool on the farm depends very much upon the manner in which it is shorn and handled, and unfortunately it is one of the farm duties that comes at a season when the farmer's hands are full. The past war conditions has given quite a boost to the use of labor-saving machinery on the farm and sheep-shearing should get attention along this line. The movement for better methods of shearing and packing should get every encouragement, as it has a very material effect on the increase of revnue from the flock.

Shearing Made Easy

Shearing with the shears or blades is now almost an obsolete practice in all sheep-rearing countries. For the farmers with only a small flock they are considered a rather expensive outfit, but on a co-operative basis—one machine in a community—they will pay in higher values for wool and also as time savers.

They will do a better job, are easier on the sheep as well as the operator, and will turn off a larger yield. Hand-shearing isa laborious business generall to the man with the small flock and the work is irritating and fleeces are broken, and sheep badly used in the operation. The machine eliminates a lot of cruelty to the sheep, by the ease and speed with which the work can be done.

This year quite a number of beginners will be at the sheep-shearing job and with the blades they will make poor headway and spoil many good fleeces, but with a machine a novice can become an expert in a short time. **Where a farmer has a gasoline enigne or other small motive power, sheep shearing with the machine becomes more of a picnic than a drudge.**

The Proper Place to Shear the Sheep

The first duty in sheep shearing is the choosing and preparing a clean place for the work. A great deal of waste and unnecessary hardship on the sheep follows careless preparation for shearing. The place where sheep ar penned before shearing or during the process should be entirely free from straw or hay. If possible a shearing board should be made or one improvised with doors or similar boarding. This will remove every chance of having straw or vegetable matter mixed with the wool, which not only deteriorates its value to the farmer, but also to the manufacturer, and the cloth from such wool is of inferior quality. Always remember that the wool buyer pays you only for the clean content of the clip, and if you think to deceive him by adding weight in the shape of dirt, manure, sand or other foreign material, the loss is yours not the wool buyer's. The farmer should always carefully figure on the shrinkage, and if there is none to take off for waste matter, he will get the full value, but if there is shrinkage it will generally be in the buyer's favor and the seller has small room left for complaint.

Attending the Wool and Shorn Sheep

When the fleece falls from the sheep it should be kept free from the animal's and shearer's feet. If it is in any way kicked apart and the fibres twisted, its appearance and vlue is lowered. Also avoid undue handling. Remember that a well tied fleece attracts more attention than one indifferently bundled up. It is useless waste to be careful with the clipping and careless with the tying; or vice versa, the one operation is equally as essential to a high value product as the other. **If you have managed to produce the well shorn, clean fleece see that the tying operation is well handled.**

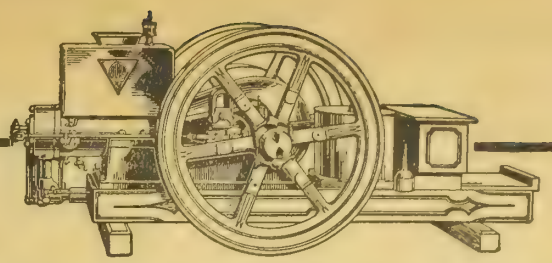
When the animal is clear of its wool, the edges of the fleece should be folded over toward the centre, and then rolled up from head to tail or from tail to head as tightly as possible. Binder twine should never be used, for it causes a good deal of trouble to the manufacturer, as it will not take the dye, and pieces of it will show up in the manufactured article. Paper fleece twine is the proper material to use, for it dissolves in the scouring process.

In sacking the wool, it should be packed as tightly as possible, and see that no moisture reaches it. Wool draws the moisture from the ground, and if wet in this manner, or by rain, the fibre is spoiled so that it is almost impossible to comb in the factory. The buyer will count shrinkage off wet wool, so keep it dry.

Tending the Sheep

So much for the wool, but it may be necessary to say something about the newly-born sheep, especially the ewes. It is a wise and profitable proceeding to shelter them for a night or two after shearing. A good few lambs are prematurely weaned when they ar drivn out promiscuously to the field and the cold chill that the ewe gets on a cold or rainy first night often dries up her milk flow. With machine shearing it is of the utmost importance to shelter the shorn flock, for a night or two, whether the weather be dry or wet. The machine cuts so much closer than the average blade-shearing by hand.

Canada has plenty room for sheep and she now has a chance to let the world see what she can do in the way of producing wool. Let her product be the best handled on the market, and buyers will be after it every time. Rmembr the handling goes a long way with the quality in wool.



Alpha Engine RELIABILITY

RELIABILITY is the keynote of the Alpha. It RUNS when you want it to—chugs away all day and you never need to think about it.

It's always reliable; always ready.

Why?

Because it's so simply and sturdily designed and so expertly and honestly built.

There's nothing complicated about the Alpha—no electric batteries; no delicate attachments to "keep you guessing."

Just oil it; turn on the fuel—either gasoline or kerosene—and the Alpha does the rest.

It takes a whole lot of the drudgery out of farmwork, and, in addition, saves time and fuel.

Made in 12 sizes, 1½ to 28 H. P.

If you are tired of "SHAKING" the butter from your cream, investigate the "Reliable" Churn.

It "CHURNS" for you just as effectively as did mother's old fashioned "Dash." Gets "all of the butter from the cream," and many times more easy.

Its clever mechanism gives that efficient perpendicular stroke, but with a high-geared rotary drive, and it is easier to keep clean, too, just lift out the smooth, white, double glazed jar and rinse.

You can get a book which illustrates every part, gives you full information of hand drive (which can be operated by a child of six) belt drive and electric drive Reliable Churns.

THE HORSE

PURE AIR AND VENTILATION HAVE MUCH TO DO WITH THE GENERAL HEALTH OF HORSES

Horses' ills and veterinary bills would greatly decrease, if more attention were paid to the comfortable and sanitary housing of the equine breed, young and old, about the farm. It is not generally known, at least it is not apparent from the construction of the average barn, that an adequate supply of pure air is more essential to the thrift and well being of horses than food and water. But it is useless to argue as to which of the three—air, food and water—are the most important. One thing is certain that in speaking of a balanced ration, it is not complete without pure air in the surroudings in which it is fed.

More attnetion to use of balanced rations, and other improvements in the methods of feeding have been of immense value and greater results could yet be accomplished if they were more generally practiced. Only in a comparatively few cases however is there any attention given to pure air in the stable. As a matter of fact, the tendency is to give considerable attention to the question of warmth in the construction of the horse barn, and in many cases warmh is obtained at the expense of ventilation.

Evil Effects of Foul Air

No animal about the farm is more susceptible to the evil effects of foul air than the horse. When he breathes the same foul air over and over, he is deprived of sufficient oxygen to the body. All attempts of nature to get rid body wastes and poisons is impossible; they are repeatedly passed through the system and lower vitality and less vigorous health is apparent. If any disease is around, the animal in the badly ventilatel barn is sure to have an attack. Influenza among horses, a malady that more horses succumb to than many farmers are aware, is due largely to bad ventilation.

Ventilation to be effective must provide for a change of air so that a fresh supply of oxygen is conveyed to the horses at all times, and so that the products exhaled are promptly carried to a point where they will not be again taken into the body. The necessity for fresh air are subjects which cannot be over emphasized. Whether an animal is thrifty or unthrifty; whether it resists or yields to the attack of disease; and in extreme cases, whether it lives or dies, is dependent in large measur upon the character of the air it breathes.

Warming Cold Air

Since the success of practically all systems of ventilation is based upon a difference in the temperature between the air inside and outside of a building, it is evident that a biulding must provide for such a difference in temperature. A good ventilating system will work more efficiently and can be kept under more perfect control in a warmly constructed building than in one whose construction is so open as to keep the stable cold and yet lacking the system to give adequate ventilation. Cold air is not necessarily pure air, nor is pure air necessarily cold. The converse is true of warm air. The whole problem of stable ventilation does not consist in providing plenty of fresh air and removing the vitiated air. A very considerable portion of the problem has to do with the maintenance of a comfortable temperature at the same time that adequate ventilation is provided.

The provision for pure air, and a comfortabel temperature, is an economic question and closely connected with the profits of horse breeding. The health and thrift of the animals and the most efficient use of feeds depends in a large degree upon the extent to which they are provided.

The Sanitary Floor

Another feature in the stable that is against the health of the horses is the wooden floor that is not kept in a sanitary condition. The concrete floor has all the good qualities which are lacking in the old wooden structures. Notwithstanding the many excellent qualities of this modern material for floors, in it alone is not found the ideal stable floor material. It is faulty in two respects, it is too hard and too cold for animals to stand or lie on. In laying a stable floor with concrete, allowance should be made for two inch planks to be laid in the stall.

The wood should be laid flat on the concrete so that no space for urine will be allowed between the cement and wood. The latter will wear out or decay in time, but the cement will be permnaent and sanitary.

The horse stable should always be covered with wood in the stalls for as a rule, the animals will work the straw off a cement floor and leave it bare. Box stalls, however, for either horses and colts where bedding is used to keep them clean will need no covering.

In reply then to the question "Which is the best material to use for a stable floor?" no straight answer can intelligently be given without at first knowing the use to which it is to be put.

In a general way it may be said, however, that concrete should always be used in basement joors and if the needs o fthe case demand it, it should be overlaid with wood, making it a concrete floor.

Elevated floors or floors not resting on the ground will generally be cheaper and easier placed in position if built of wood, since the nature of concrete usually requires that its foundation rest upon solid earth or rock.

The Necessity of a Harness Room

In too many cases the windows are depended upon entirely for ventilating a closely constructed building. Ample window space is essential to a comfortable and healthful building for the housing of livestock, but it is seldom, if ever, that good ventilation is provided thereby. When the weather is cold the windows are almost invariably closed and in poorly ventilated stables moisture freuqently condenses and runs down the windows and freezes so that it is almost impossible to open them. The walls of the stable are generally in the same damp condition as well as the harness that hangs on the wall behind the horses.

Greater Strength and One-Quarter the Cost

FOR the heavy work rope traces are stronger and will wear longer. In rough work leather traces are stiff and get scraped; or they rip. Griffith Giant Rope Traces are flexible, can be slipped on in a jiffy and will not break. Remember, they are, by actual service tests, proven stronger than leather.

Giant Rope Traces are complete with malleable iron ends and electrically welded steel chains; either 7/8 inch for farming or 1 inch for lumbering. Price complete with 7/8 inch rope, set of four $6.00. (West of Fort William $6.50) 1 inch size $6.50. (West of Fort William $7.00.)

Griffith's Giant Yoke Ropes to replace leather pole-straps; price complete with snaps and shides. Per pair $1.40 (West of Fort William, $1.60).

Ask your dealer for them; or write us direct, giving us dealer's name.

Griffith Giant Rope Traces

G. L. Griffith & Son, 64 Waterloo St. Stratford, Ontario

10

here is more deterioration and loss n harness equipment due to the way it is kept when idle than at work. In badly ventilated barns it is wet all the time, and when taken out for use it gets hard and dry. nI this hard condition it gives rise to many of the blemishes, such as sore shoulders, sweeny, fistulas and such troubles that cause pain to the horses and reduces their value as a motive power.

There should be a harness room in every stable, or a large cupboard, with folding doors, if no other arrangement can be had. Even in well ventilated barns, the harness should not be left near the horses, the dust of grooming lodges on it and remains there, through the harness being sticky from the sweat of animals.

The effcet of good ventilation by way of removing moisture and preventing dampness in a building where a number of animals are housed must not be overlooked. While it is true that there are conditions under which moisture will condense upon the cold surfaces of walls and windows, even when good ventilation is provided, it is also true that good ventilation tends to make a stable dry and poor ventilation tends to make it damp.

RAVENOUS APPETITE IN YOUNG HORSE

I have a five-year-old horse that has at times a ravenous appetite and eats brush or anything he can get a hold of. Sometimes he gets exhausted at work and shows signs of illness, but when he gets into the stable he starts to eat. He shows no sign of pain. Is there anything I can do for him?—R.J.

Reply.—Your horse is apparently suffering from diabetes, and your immediate attnetion should be directed towards giving him a change of diet. Then a mild laxative may be given, say a pint of linseed oil, and a tablespoonful or two of powdered chalk or baking soda be mixed with a pail of drink. For a cure best practicioners rely on iodine, and a convenient formula is: Iodine twenty drachms, iodide of potassium one drachm, carbonate of soda four drachms. This dose to be given thre times a day in water.

YOUNG COLT HURT IN STIFLE

I have a colt about ten months old hat got hurt in the stifle last fall and t slips out and in. What can I do or it?—W. J. A.

Reply.—Apply some blistering, but before doing so the hair should be cut on the part, and the place thoroughly washed, and after it is dry, apply the following with smart friction or several minutes. Powdered canthrides, one part. LarJ heated to 212 degrees, 12 parts. Mix well together. At this strength, the ointment will raise a good blister that will never blemish.

Repeat the appliction again after t is healed, and tie up the colt by the head for a few hours after blistering. This wil lprevent him blistering his mouth.

PEACEABLE COLTS IN THE MAKING

Two three-year-olds, a gelding and filly, were recently turned into the winter quarters already occupied by several weanlings. The groom protested that they would fight. The owner argued that there was no other available shelter and so a trial was worth while. The colts did not fight. After a little scampering about they all settled down to the same routine of eating, drinking and play to which the weanlings had been accustomed.

These colts occupied a shed open on the south side, and they had free access all the time to the 10-acre pasture in which the shed was located. A day's allowance of hay was fed each morning in an outdoor rack and oats were fed twice a day in two long troughs, also out of doors. The owner ascribes the peaceable behavior of the colts to the roomy open-air accommodations. The colts thrive and grow. Their hair is shaggy, but there is plenty of flesh between the hair and teh ribs. Feet are worn down level and smooth without trimming, and joints and tendons are as hard and clean-cut as one would wish. No cocked ankles or boggy hocks disfigure any of them. Plenty of feed, plenty of exercise and plenty of fresh air are the lot of these colts and evidently nothing more is necessary.

Horses do not seem to enjoy kicking at the spot where some horse stood a moment ago. They like to hit the solid mark and that is seldom possible where there is plenty of room to dodge. And so in spacious quarters they are content to live. Even sedate old brood mares, disinclined to run and play, wlil crowd peaceably around and play, will crowd peaceably around and shelter, but they will kick and struggle for supremacy when fed the same hay under a shed. Valuable pedigree mares spend the winters out in the open for this very reason.

Whatever the psychology of the case may be, it is sufficient for practical purposes to know that outdoor freedom promotes peace among horses and colts. They are also cared for with much less work under these conditions. Feeding, watering and stable-cleaning are reduced to short tasks. Extra work caring for stabled colts does not make them grow faster or keep any more sound or shapely. It is largely wasted work.

HORSE HAS SWEENY IN LEFT SHOULDER

Horse that has had sweeny in a shoulder since May. He has run in the pasture since June. On the advice of a veterinary surgeon I blistered the shoulder and repeated it in two weeks. The lower part filled in but the upper still remains hollow and hard. What would you advise?

Reply.—The veterinary you called has biven you the best known remedy, that of repeated blistering with mild blisters, and long periods of rest. The best authorities on the subject have no other recommendations to offer. The nerves or blood vessels of the affected parts seem to be injured by the presure of the collar. Keep on blistering along with the rest cure till better.

A BLISTERING SALVE FOR SPAVIN

A blistering salve for spavin may be prepared by using a mixture of two drams each of biniodine of mercury and powdered cantharides and three ounces of lard. Clipp off the hair and brush the skin clean and dry. Tie the horse short so that he will be unable to kick or bite the treated part. Rub the blister in, a little at a time. for 15 minutes, then smear some of it upo nthe skin. Wash the blister off in 48 hours and then apply a little lard once daily. Turn the horse into a box stall as soon as the blister has been washed off. Repeat the blister in three or four weeks, if it seems to be necessary.

CANADIAN EXPLOSIVES TRADE CXL MARK LIMITED

POULTRY.

EUROPEAN MARKET FOR POULTRY

A French poultry expert, according to advices received by the Canadian Trade Commission, states that there is an urgent need in France for 3,000,000 breeding hens at present. tI is estimated that egg and poultry production there in the last four years has decreased 50%. Over 6,000 hens have been given by British traders to help the restoration work in Northern France.

Conditions in Poland are said to be such that hundreds of thousands of fowls are wanted, and British experts are advocating that the newer breeds be at once introduced into the devastated areas.

The Trade Commission suggests to poultry men and farmers a continuance of the Greater Production Campaign of last year. The cheapening of feedstuffs is in their favor.

Canadian exports of eggs in 1918 roundly totalled 4,000,000 dozen, one-half the quantity exported sixteen years ago. Great Britain alone before the war imported 190,000,000 dozen annually.

One broad idea which the Trade Commission is trying to impress on the agricultural and manufacturing interests is that the present emergency demand in Europe should be regarded as the stepping stone to permanent trade. The field in the poultry trade will be ample for some years to come.

CARE OF MOTHER HEN AND CHICKS

To those poultry raisers who brood by the hen, all there is to say is to let the hen do the brooding. Keep the hen free from lice and also keep her dry and keep the coop clean. t is no difficult task; all that is needed is thoughtfulness and careful attention. Baby chicks will get under the old hen whenever they feel the need of a little warmth. It is, therefore, very important that the hen should be kept dry. Do not allow the hen her liberty with her brood for at least four week. This will give the chicks plenty of opportunity to become strong. Unless the grass is short and conditions favorable it is better not to turn her out as early as four weeks. The first two weeks, however, are the most important in the life of the chick, and the most important factor is brooding during that period. The hen will do that properly if given the proper place and let alone. To those operating borooders the best advice that can be given is, "Watch, and follow instructions." Don't be too big-hearted and overfeed the baby chicks the first week, as it is a well-known fact that more chicks die as a result of overfeeding the first week or two than from any other cause. Many poultry raisers do not realize this because many chicks, owing to their strong vitality, do not die during that short period of one, two, or three weeks, but hang on for a longer period and then die. The death of these chicks is attributed erroneously to other causes when in reality it is due primarily to overfeeding during the first week.

FILTHY HENHOUSES BREED DISEASES

It should be remembered that filthy hen houses are ideal places for the breeding of many kinds of insect pests, especially if they are damp and so closely enclosed that sunlight is unable to penetrate them.

Impure water and damp quarters are responsible for a great deal of the bowel troubles that affect so many of the nearly grown birds. Rheumatism is, as a rule, traceable to dampness, as is also much of the other muscular weakness that many fowls are subject to.

Overhead Expenses

Free yourself from the annoyance of roofing troubles. Save repair costs. Obtain protection from fire and weather for all your buildings. Have a roof that pays for itself by giving years of satisfactory service. Lay

PAROID
A
NEPONSET ROOF

No matter how large the roof may be, Neponset Paroid is the proper roofing. You can't get a roof that Paroid won't cover—for Paroid roofs them all—from the biggest barns to the greatest industrial plants.

Neponset Paroid is fire, weather and wear-resisting. It proves its economy by years of wear.

Roof with Paroid—It pays. Made in three colors, red, green and slate grey.

Sold by Hardware and Lumber Dealers.

BIRD & SON, LIMITED, HAMILTON, ONT.

Mills: Hamilton, Ont.; Pont Rouge, Que.

Warehouses: Toronto, Montreal, Winnipeg, Calgary, Edmonton, St. John

Lung troubles and throat and head afflictions are usually the result of improperly ventilated roosting places. As a means of prevention of all of these troubles it is best to practice cleanliness, proper ventilation and admission of plenty of light.

Keeping the quarters dry, clean, well-lighted, and giving the hens plenty of pure air, pure food and pure drink, are the corner stones upon which success with poultry is built.

W. F. E.

DOCTORING THE SICK CHICKENS

On a business basis, one can not afford to spend much time doctoring sick chickens, unless they are valuable show birds or breeders. Poultry doctoring is so full of uncertainty that we never feel justified in spending much effort on a chicken that can easily be replaced. Of course, a slight disorder such as scaly legs or indigestion, can be cured without much bother and with reasonable certainty. We always try to take care of such things promptly, before they have a chance to run into something serious. When real roup, canker, cholera, or other contagious ailments sets in, we usually regard it as a waste of time trying to dope the fowl. The time and medicine required may be worth more than the chicken. Moreover, we never want to retain fowls for breeding that have had a contagious disease.—S. P.

PERCY CAREY, Yarmouth, N. S.

SELECTION OF EGGS FOR HATCHING

Set only good sized eggs, uniform in size.

Set only good shaped eggs, uniform in color.

This all you can do with a little care in selection.

It is worth while as eggs of good size, color and shape and uniform are a marketable product at higher prices than small eggs varying in color and all shapes.

Eggs weighing less than two ounces should not be used for hatching. The large sized egg hatches a larger chick.

This larger chick grows faster than the smaller chick.

This larger chick will be marketable as a broiler sooner.

This larger chick matures younger.

This larger chick begins laying sooner than the smaller chick.

The income is received sooner and they are more profitable.

These facts apply to all breeds. The comparisons are made between small and large chicks in the same breed. Careful selection of eggs for hatching pays. Don't neglect it.—H. W. S.

R. O. P. POULTRY

Gradually poultry breeding is becoming more like live stock breeding. It will not be many years until every buyer of a cockerel to be used in the breeding yard will insist on knowing the sire and dam of the cockerel before he buys the bird. The buyer will also want to know how many eggs the dam of the cockerel produced, and how many eggs were produced by the dam of the sire of the cockerel he is buying. Right now many buyers—some of them farmers, too—are demanding to know what's back of the birds they contemplate purchasing before laying down any money. The day of the scrub rooster in the farm flock has just about passed.

INCUBATOR AXIOMS

Follow the manufacturer's directions in setting up and operating the incubator.

See that the incubator is running steadily at the desired temperature before filling with eggs.

Do not add fresh eggs to a tray containing eggs which are undergoing incubation.

Turn the eggs twice daily from the second to the nineteenth day.

Cool the eggs daily from the seventh to the nineteenth day. When cooling the eggs, be careful not to chill them.

Turn the eggs before caring for the lamps. Keep the lamp wick clean.

Attend to the machine carefully at regular hours.

Test the eggs on the seventh and the fourteenth days.

Do not open the machine after the eighteenth day until the chickens are hatched.

THE NEW POULTRY HOUSE

Select a location that has natural drainage away from the building. A dry, porous soil, such as sand or gravelly loam, is preferable to clay soil.

In most localities the building should face south, which insures the most sunlight throughout the year. Allow about 3 square feet of floor space per bird. Proper ventilation and sunlight mean a dry house and healthy birds.

The keeping of an egg record is a very simple matter requiring only a sheet of paper and pencil. Even the childern who gather the eggs can jot down the number brought in each day. This daily record can be added up and the value at market price figured out once a week or once a month as desired.

Turkeys and chickens destroy many insects that prey on the plants in the field and the garden. It would be hard to estimate the value of a flock of turkeys for the destruction of insect pests. But remember that in addition to this help they bring in cash income or supply the table with suitable and needed foods.

PLOW TO THE FENCE LINE

Because of the present high price of living and farming, every farm owner should utilize every available foot of ground to the best possible advantage. You cannot do this with the old rail fence. You are bound to have a lot of waste land in the fence corners, growing obnoxious weeds, infesting the whole farm and making an unnecessary expense and a waste that should be obviated. You are interested in making money—not wasting it. A farm to bring a return for the money invested and the labor expended must be farmed thoroughly—all of it farmed thoroughly. There must be no waste fence corners and no weeds to contaminate the land. A farm to be profitable must be clean.

When you plow to the fence line, as is shown in this illustration, you reach a maximum efficiency. A full hundred per cent fence satisfaction is realized. These are all important considerations. A good fence must be well made. Not only must the material—the wire that is used—be of the best, but the knot that ties the stays and lateral wires together must be of the best. Then you have a fence that stays where you put it. Same even tension winter or summer—strong—durable.

There is great satisfaction in constructing a good fence like the

SARNIA

Fence for these reasons. The strong line wires have a wave or crimp which gives elasticity and spring to the fence and also provides for expansion and contraction caused by heat and cold. Great care is given to a uniform tension on each wire, so that there will be no long wires to make the fence sag, nor any short wires to take up all the strain and break. The strain is evenly distributed on each wire. The Sarnia Knot fastens the stay wires to the line wires in such a manner that they cannot be slipped in any direction. At the same time permits easy erection over rough or uneven ground without kinking or bending either the lines or the upright wires.

We sell direct; prepay freight on all shipments in Old Ontario. New Ontario, Quebec and Maritime Provinces, 4 cents per rod extra. Send for descriptive literature, price list and order blank.

Sarnia Fence Company, Ltd.

Winnipeg, Manitoba **Sarnia, Ontario**

COLOR IN EGGS

"I have ten Barred Rock hens and they are all the same color and size. They do not lay eggs the same color, some are darker than others and some are almost white. They are great layers. Is it natural to them or not? Would the chicks differ in colors, from the uniform colored eggs?"

It is very common for bred-to-lay Barred Rocks to lay eggs that vary considerably in color. The color of the shell has nothing to do with the color that teh chicks would come. The color of the shell varies considerably according to the length of time the bird has been laying. That is, at the beginning of the laying period the shell may be quite rich in color, but toward the end of the period it becomes light. —G. R.

DIARRHOEA IN CHICKS

"Kindly inform me through the pages of your valuable paper, how one can prevent young chicks from getting the diarrhoea which almost always proves fatal. I lost a great many about ten days old last year and I wish to rectify matters for the coming season."—W. W. McC., Dunnville, Ont.

Ninety per cent. of the diarrohea in young chicks is due to a chill. Handle the chicks so as to avoid this and you will probably not have much trouble with diarrhoea. Feed them sparingly for the first ten days and keep them busy. Keep a dish of dry mash and buttermilk in front of them from the start, but teach them to scratch for their grain.——G. R.

Don't raise geese in the door yard. Have a pasture fenced apart and not too near the house.

Pratts DISINFECTANT

kills lice and mites. Keeps down bad odors. Destroys disease germs. Use it for spraying roosts, nests and poultry houses.

At your dealer's in 1 gal. and 1 qt. cans.

Produce More Eggs Waste Less Feed

PRATTS Poultry Regulator will help you get more eggs—more chicks—more layers—more profits. What's more, it will help you to save money on feed, because it makes your fowls digest their feed and turn it into eggs. Poor digestion is a source of waste, and waste reduces your profits.

"Pratts," added to the daily ration, will pay handsome dividends in health, vigor, and egg-production.

At your dealer's in popular priced packages, also money-saving 25-lb. pails and 100-lb. bags.

Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

God does not send us strange flowers every year
When the Springtime comes in all the pleasant,
The same dear things lift up the same dear faces,
So must it be that after death's dark winter
God will not put new things in heavenly places—
The same love will look out of the old faces—
I shall have thee.

—Mrs. A. D. Whitney.

THE VAMP

(Continued from last issue)

Passing Mr. Day, though still dancing with Tug, Miss Storrow had reached out a slim hand; had drawn him to them. They danced a trio, for a while.

"She's a wonder!" Phoebe commented. "Do you know, I envy her! I don't think that I've ever flirted in my life. I'm just beginning to realize what I've missed."

"Well, she isn't missing much," Mrs. Day declared grimly.

"Doesn't Molly look sweet tonight?" Phoebe went on. "Look at her gold slippers!"

"She told me," Mrs. Day said, "that Eliott admired Miss Storrow's slippers so much that she went into Boston yesterday and bought three pairs gold, silver and bronze."

Somebody was cranking the phonograph, so that the dance was unduly prolonged. Miss Storrow kept on accumulating partners, until now she danced in the midst of a group of six; a laughing white-and-scarlet accent to the black mass of men.

In fact, the evening turned into one prolonged ovation to Miss Storrow. She divide, re-divided and sub-divided She introduced new solo steps; even group improvements of Terpsichorean kins. And when she was not dancing she was tete-a-teteing with one victim, or coquetting with three or four. She was sweetly courteous to the women; but it was apparent that she did not see them when she looked at them.

"Molly, isn't this a scream?" Phoebe said once to her hostess. "My sense of humor hasn't entirely deserted me; but I'm afraid it's wearing a little thin. What is she like, to live with?"

"My dear!" Mrs. Meredith poured out a torrent. "You ought to have been here. I've never been so ignored in my own house in all my life. The moment Elliott comes home she monopolizes him as though they had just become engaged. When I do venture to speak—which is very rarely I assure you—she listens to me with such a ceremonious look of interest that I wonder why I started to say anything."

"I don't know what her plans are," Phoebe commented. "The only place that I've heard of where they permit polyandry is in Afghanistan. When I hear of Tug buying a ticket for the Orient, I'l lconsult a lawyer at once. Your slippers are lovely, Molly."

"The Vamp has flashed a different pair every night and Elliott just made me go into town and buy some. He said he knew my feet were smaller than hers. They are, too!" Mrs. Meredith eyes danced with triumph.

But that evening at the Meredith's was only a delicate foreshadowing of what was to happen. Phoebe's house became a sort of telephone exchange for what was going on.

"What dou you think that Storrow female has just done?" Mrs. Brodbeck demanded vehemently over the wire a day or two later. "Tom has just called me up from the office for no reason, apparently, than to tell me she has just telephoned him from somewhere in Boston where she is lost. She is so frightened—poor, helpless, shrinking little thing—that there was nothing for him to do but offer to go for her in a taxi. Of course he'll have to invite her to lunch. Did you ever hear of such a proceeding?"

"No, I never did!" Phoebe answered with conviction. "However, Nina, you looked lovely last evening! You were ungallant enough to be the belle of your own party. That blue chiffon over the green made an exquisite effect! Didn't Tom like it?"

"Oh, yes. He liked it so much that he bought tickets for the opera ttonight; and insisted on my wearing it!"

"Well, Phoebe," Mrs. Fall broke out when the two women met marketing a few days later, "that Storrow creature goes to Boston on the train with Fred every single morning and comes out with him every single night. She sits with him all the time, of course. Fred told me that he wanted to do something for her; so he bought matinee tickets and sent them to her. I almost told him that he could depend on me to do the family entertaining of strange women. But of course I didn't!"

"Well, Miriam, you never looked so well in your life as you did last night. Your hair was wonderful. Who did it?"

"Madam Lili. Fred told me that I'd simply got to have her do it twice a week."

"And wasn't Dolly Day a vision!" Phoebe said enthusiastically. She's so little and blond and delicate. She seemed to float in a mist."

"And wasn't Carl proud of her!" Mrs. Fall laughed a little. "He simply couldn't take his eyes off her all the evening."

"Wasn't the Vamp marvelous last night?" Phoebe went on.

"I should say she looked like a nasturtium, in all that yelolw and orange. And weren't those earrings just the right touch. They were like little golden lamps! That dress gave Molly an idea. She's had tucked away for years some beautiful brown and green gauzy stuff that she got at Liberty's in London. She's going to have it made up right away—along the lines of Miss Storrow's dress."

"Well, girls," Phoebe greeted the members of the Sewing Club which met at her house next afternoon, "after all, for five wrecks of matrimony, you are looking pretty well. Everybody's got new clothes."

Her visitors laughed; but there was an element of exasperation in their mirth.

"Where is she this afternoon?" Mrs. Day asked. "I don't think she's with my husband."

"Probably she's with mine," Mrs. Meredith answered, "if not with Tug or Tom or Fred. Perhaps she's corraled all five."

"What sort of a guest is she, now that you've had her for a week?" Phoebe asked curiously.

"Oh, nice enough—if she's ever let me speak to my own husband. I had to signal to him this morning to go out into the hall—to ask him for some money. Curiously enough, the servants all like her, and Belle's children are wild about her. I must say she has put herself out for them, tells them stories and plays games with them—"

"Well, I certainly think she is a strange critter." Mrs. Day's tones seemed to dismiss the problem as a hopeless one.

"For goodness sake!" Phoebe emitted sibilantly, "here she is now, coming up the walk."

Her guests fell into a constrained silence; listened avidly to the footsteps of the maid crossing the hall, to the opening of the door, to Miss Storrow's fresh clear tones. And then, as with one accord, they plunged into ejaculatory conversation.

"Oh, how do you do, Miss Storrow?" came out of the chatter in Phoebe's most composed accents, as she rose to greet her gust. "This is a pleasant surprise. I'm delighted to see you."

"You would probably like to add, 'And to what do I owe the pleasure?' I'm leaving tomorrow; so when I got home unexpectedly early from my walk and learned that Mrs. Mrdith had come here, it seemed the easiest way to say goodby to you all."

"Oh, it's too bad you'r going so soon. You haven't had half a chance to know Maywood." Phoebe's conventialities carried a slight frigidity of tone. "We are all sorry to hear that."

"Are you?" That's nice of you—to say?" Very slightly Miss Storrow accented the word say. There ensued a chilled silence.

Miss Storrow broke it cryptically. "I think I'll have to do it," she announced. Then without explanation she asked, "Have you ever visited that little town of Troy where I was brought up, Mrs. Meredith."

"No," Mrs. Meredith answered civilly, "I never have."

"It's a strange little place; dead, dull, uninspired and uninspiring. I've lived there al lmy life. This is the lrst time I've ever escapd from it.

"I was brought up in a gray, chilling atmosphre. I had no father or mother, or sisters or brothers. I lived alone with an aunt, an old maid of a pronounced type."

She stopped and looke about the circle as though trying to find re-

ECZEMA SPREAD OVER ENTIRE BODY.

No rest night or day for those afflicted with that terrible skin disease, eczema, or, as it is often called, salt rheum. With its unbearable burning, itching, torturing day and night, relief is gladly welcomed.

It is a blessing that there is such a reliable remedy as Burdock Blood Bitters to relieve the sufferer from the continual torture and who can get no relief from their misery.

Apply it externally and it takes out the fire and itch and aids in the healing process. Take it internally and it purifies the blood of all those poisons which are the source of skin eruptions.

Mr. Andrew Bowen, Highland Grove, Ont., writes:—"I must say that Burdock Blood Bitters is a wonderful preparation. I had a very bad case of eczema which spread almost over my entire body. I tried doctors, home treatments and many other patent medicines, but with no results. A friend advised me to try B.B.B., and after taking five bottles, I am thankful to say they cured me completely."

B.B.B. is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

sponse of some kind in the eyes which surrounded her. But none came. The women had resumed their sewing; were looking up at her at intervals with a look of polite attention, a little tinged with question. Miss Storrow went on. "I don't remember any color in my childhood or in my young girlhood—any color of any description. By color, I mean actual color and a lot besides—books, pictures, music, the theater, dancing; and above all, beautiful clothes and the admiration of the other sex."

Again she paused. Again she sought the circle of eyes. And now, that interest which she awaited began to shine through the frigid civility of their expressions.

"I never went to parties or to the theater. I never had men call on me. I don't even remember ever wearing a dress that wasn't a drab horror. I don't remember ever having anybody tell me how to do my hair. Or what colors became me. And yet I loved beauty. . . . . Oh, how I loved beauty! How I longed for a brilliant red hair ribbon. . . At eighteen, I was the ugliest, lankiest, most colorless, most awkward, most uninteresting creature that you ever saw in your life. And then, at that precise, moment I complicated matters by falling in love with Jerry.

"Of course I don't have to tell you that, to me, being the kind of girl I was, Jerry was the handsomest, ablest and most popular man in town. He had all the charms and all the accomplishments proper to young manhood. I fell in love with him in direct proportion to the degree of his attractiveness . I knew him—but I had never really talked to him. He knew me, but he had never really looked at me. It was not to be expected that he would; for very beautiful young thing in Troy was ready to fall like a ripe peach into his hands." Her voice tapered off into silence. Suddenly, she put her hands to her ears; removed the jade earrings. Quite calmly she began to take the hairpins out of her hair.

After a few seconds, Miss Storrow resumed her narrative. But all the time her fingrs were flashing through the bat masses of her dusky hair.

"I was awfully conscious, under my shy awkwardness, that I was a complete failure in every way a girl can be a failure. And I was very rebellious about it. On day—I don't know quite how—it occurred to me to wonder if that failure was necessary. There were half a dozen girls in Troy who were extraordinarily successful socially and great favorites with the men. I began to watch those girls. And do you know, soon I came to the conclusion that much of it was the result of a system. Not all—there are some women who are born to conquer. It's natural with them. They don't have to think of it. But with the rest, is is a system. And I was convinced that I'd found that system, and I was perfectly certain that I could put it into operation. But I had to try it in a place where nobody knew anything about me."

By this time all the pins had emerged from her hair. A curious figure, in the midst of its shining torrent, she sat for a moment silent.

"I came into a small legacy a few months ago. Instead of putting it to a useful purpose, I decided I would use it proving my point. I had one friend—one true friend—Alice Robinson. I went to Alice and told her my entire plan. I said to her, 'There's only one way in which you can help me, Alice, and that is to send a letter to your friends in the East warning them against me as a flirt.' That was the one you received from her. I wrote it.

"So I came East. I went to New York and spent one solid month just buying clothes—the clothes I'd always wanted and never had. I studied those clothes down to the finest detail. I said to myself, 'Every time I enter a room it's going to be as though the lights were suddenly turned up!' A clever hair-dresser experimented one whole morning, trying to find the most striking way to do my hair. I went to a beauty shop and paid them to teach me how to use cosmetics."

Suddenly Miss Storrow lifted the mass of hanging hair; submitted it to a few slashing strokes of a side comb; pulled it straight back from her forehead. With a few lithe turns of her hands, she coiled it into a stiff, hard knot; pegged it down. "Ladies," she continued, "behold the original Sibyl Storrow."

The metamorphosis was almost unbelievable. The picturesqueness, which the flat, curved, black loops had given to a rather pale face, had entirely disappeared. Her eyes had no beauty to help in illumination. With the earrings gone, she had turned ordinary.

The five women stared, fascinated.

"You see, I felt if I could come, with all this preparation of clothes and cosmetics, into a community which had been warned of my flirtatious habits, I could pull off a sensation. And I did it."

Phoebe was the first to recover. "You certainly did."

"I might say that I don't expect

Suffered Since Childhood

Kidneys at the Root of the Evil

Think of it! The joys of youth marred by agonizing pains, and all hopes of a bright future blotted out by thoughts of a life burdened with Backache and other sufferings.

Such was the case of Mr. A. Cail until a good friend advised him that there was a remedy for his trouble and he would find it if he used Gin Pills. Read what Mr. Cail says:

"I was troubled with my Kidneys since childhood and spent a large amount of money on doctors trying to get cured. Instead of getting better I kept getting worse until a friend of mine advised me to try Gin Pills. I did so, and after taking one box I was able to get out of bed and walk around. Two more boxes relieved me completely and since then I have had no return of the trouble."

This remarkable testimonial was written by a man whose statement cannot be doubted. Mr. Cail's reason for writing this history of his case was—gratitude for the relief that Gin Pills brought him. Wouldn't you do the same if your case was similar? If you suffer now—don't suffer any longer. Use Gin Pills and obtain relief from Kidney or Bladder Trouble, and the pain, suffering and inconvenience that they cause.

NEVER TROUBLED WITH CONSTIPATION SINCE TAKING MILBURN'S LAXA-LIVER PILLS.

Too often one is liable to dismiss constipation as a trifle. It is not. When you allow your bowels to become clogged up, there pours a stream of polluted waste into the blood instead of it being carried off by nature's channel, the bowels, and when this waste matter gets into the blood it causes headaches, jaundice, piles, liver complaint, sour stomach and many other troubles.

By taking Milburn's Laxa-Liver Pills you will find that the bowels will be kept regular in their action, the poisoning of the blood and general weakening of the system is rectified, and the entire body is restored to normal condition.

Miss Elsie Zimmerman, Thedford, Ont., writes:—"I have used your Milburn's Laxa-Liver Pills for constipation, and have never found myself troubled since. I am very glad to have found something to cure me, and will always tell everyone about them who is troubled in the same way as I was."

Price 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto. Ont.

you women to forgive me," Miss Storrow went on with a smile which was very different from her premeditated vampire sparkle, "but I know that you are going to do it. The instant I laid my eyes on you, I knew you to be a dandy bunch of women. You don't know how I hated flirting with your husbands. But it had to be done."

Mrs. Meredith smiled, "Yes, I see that."

"What you don't understand is what hard work it was. It really was the hardest kind of work. I made a discovery and I think I have proved it. That discovery is—that any woman of intelligence can be a vampire if she will give her whole attention to it and keep on the job every instant. She's got to ignore other women entirely, of course; ride roughshod over their feelings; behave exactly as if thy weren't there. Sh's got to devote herself to the men all the time. If they start to draw away, she must leap on them like a lion on its quarry. Almost any woman who is willing to give all her time to it, can do this. But I reiterate, it's hard work. And now I'm going back to Troy. . . ."

"But not before you lengthen your stay," Phoebe interposed. "And give us a chance to get really acquainted with you. Won't you come here to visit me?"

"If I'll give her up," Mrs. Meredith put in gallantly.

"Let us share her up," Phoebe retorted.

"Are you going back to Troy," Mrs. Brodbeck demanded, fascinated, "to dazzle, enchant and enslave?"

"Precisely that! Within three days I'll be the talk of the town. Those earrings might just as well be rings of electric lights. That lip-stick might just as well be a stick of dynamite. For the first time in its history, Troy will know I'm there."

"And Jerry?" Mrs. Day queried.

Miss Storrow mediated a moment. And as she meditated, involuntarily she pulled her hair into long flat loops on her brow; caught them there with invisible pins. The feat acocmplished, she sought the lip-stick, mechanically applied it. "Yes—Jerry. I don'tknow whether I want to marry Jerry or not, now. I've seen so many fine men in the meantime. But if I still like him, Jerry is doomed. I suppose, in that case, he'll propose to me about a month after I get home."

Let Nature Clear Your Blood

With pure, rich blood—a healthy stomach—and an active liver—you may laugh at disease, and, you may have all three by taking

Dr. Wilson's HERBINE BITTERS

This splendid blood medicine—made of old fashioned herbs—gives the system a regular "spring house-cleaning"—regulates liver and bowels—cleanses the blood of all poisonous matter—tones up the nerves—and gives strength, vigor and a feeling of good cheer to the whole system.

PENSIONS FOR DEPENDENT MOTHERS

Strongly Advocated in Paper Read by Miss Elizabeth Robinson at Kennebecasis W. I. Meeting.—"Children a Nation's Most Valuable Asset."

We are all familiar with the word Pension and understand it to be an allowance paid by the government for services performed. We hear of soldier's pensions, soldier's widow's pensions, pensions granted to government officials, railroad officials, also to school teachers who have taught throughout the length of 35 years—these are on the **retired list!**

What I want to bring before you this afternoon is the subject of Pensions for dependent Mothers with children—Mothers in **Active Service.** You may have in your mind cases where the husband dies, leaving no means to support his family, or any relatives able or willing to help. It may be the family have been extravagant or poor managers; but be that as it may, poverty is not always the fault of the needy. For instance, a man on an average salary marries and provides a home. He pays for rent, fuel, food, clothes, etc. The years go by and three, four or five children are born, all adding to the family expense. I ask you where is the money coming from to pay life insurance, or lay by for a rainy day?

Or it may be, by good management on the part of husband and wife, they have been able to save something each year. Sickness comes, the husband dies; funeral expenses and doctor's bills are paid and the mother is crushed with sorrow and care. Think of the desolation of that mother, bereft of her husband and knowing of no source of help for herself and children. The thought comes over her, what can she do to earn for them and herself; shall the sword enter still deeper into her soul and must she have the awful experience of giving up her children and placing them in some institution or almshouse? Rather than do this she will work past her strength, deny herself rest and nourishment in order to keep her little ones to herself; so she struggles with her burden. It may be an older child is kept from school to care for the home and children while the mother goes out towork through the day; but hard work and small pay leave their impress on mother and children.

Now should our country, with all its riches of forests and fields, mines and waters, allow this to be so? It has been said that "children are a nation's most valuable asset." Then it is up to our country to safeguard the children and the mothers!

With the terrible loss of life of our best manhood during the past four years, the country should see to it that the children of today, who in a few short years will be our men and women, be so trained that they become good citizens in future years. Now where and by whom will the child be best rtained, intellectually, physically and morally? Is it not in the home and by the mother?

Children in an institution are treated in groups, not individuallq. Any one who has had experience with children know that even members in one family differ in tastes and temperament, and the way to treat one child is not suitable for all.

In a well-managed institution the discipline is so rigid—they must rise, dress, eat, study and play—all by the sound of a bell; their whole training and education is such that at the age when they are dismissed from the instiuttion they are without self-reliance or fitness for the duties of life. The best citizens are those brought up in homes, where they enjoy the freedom and privilege of family life; and their early home life. where brothers and sisters enjoy together their childish games and squabbles, tend t obuild up character to withstand the stress and temptation of manhood and womanhood.

How is it possible t o give these privileges to orphans of the poor? Simply through the Legislature of our Province! Let the Government pass a bill to pension widows with chil

Neat and attractive Oxford with wing tip and military heel.

What the Dealer Means to You

THE shoe dealer does more for you than you perhaps realize. He not only carries a variety of styles and sizes for your convenience, right in your town, but he renders you a service which no one else can render in the correct fitting of your foot.

This is very important, not only for the sake of comfort, but also because the appearance and the life of your shoes depend upon correctness of fit. No matter what price you may pay for a shoe, it cannot give you its full service if it does not fit your foot.

And more than that: ill-fitting shoes often cause foot troubles, even though they may *feel* perfectly comfortable at first. Correct fitting shoes are essential, even if it means extra time and effort for you to get them.

So you should go to a dealer in whom you have confidence, let him advise you as to the type of shoe which is suited to your foot, and give him time to fit you correctly. You will get better service from your shoes if you will do this, and they will look better.

Write for our booklet "How to Buy Shoes" which gives more information on this important subject. It is sent gladly to any address in Canada upon request to our head office at Montreal.

dren. Grant them an allowance for each child under, say 16 years. The mother to make application for allowance; the cose to be under the supervisors whose duties shall be first to investigate the case and provide definite proof that applicant has a right to allowance. After the allowance is granted, they must see that the home is a fit habitation, the mother caring for the children and home, the children being sent to school, being properly fed and clothed, and state of their health;such a report to be furnished to commissioners once a year. When the applicant knows the rules regarding the allowance she receives, such knowledge will be the means of strengthening and encouraging her to do her best.

The alolwance must be **adequate** for hte proper up keep of the home; it must be **permanent.** We all know how much better we can plan the outlay when we know just how much our income is.

Government allowance for dependent mothers is not **charity!** It is a salary paid to mothers for doing work for state or country. We all know of cases during last year where boys were taken to don the khaki and the country felt it was its right, though the mother of those boys had never received help from the country in the care and expense of rearing them.

Pensions for mothers was first tried in the State of Illinois in July, 1911, and since that time, not quite 8 years, 27 states have adopted it. From statistics gathered, these states find the method of granting allowances to mothers for their cihldren in their homes, much more economical than paying an institution to care for them, and all right thinking people will agree that it is the humane way.

It is known in different states and countries by different names — as Mother's Pensions, Mother's Allowances, Mother's Compensation State Salary.

In Australia and New Zealand compensation is paid to mothers.

In Canada but two provinces provide thus for mothers, Manitoba in 1916, and Saskatchewan a little over a year ago came in line. The province of Ontario is moving for it and trying to have the act passed at this session of Legislature.

What about New Brunswick? Shall we be the last of the list of provinces to move in this? Surely it is women's work to take an interest in this movement. We cannot and must not be indifferent about this subject! We know there are many sad cases of needy mothers, broken-hearted and discouraged to whom a permanent allowance would truly be a God send. Remember He who spoke those words "Inasmuch as ye did it unto one of the least of these, ye did it unto Me." Also "Inasmuch as ye did it not unto one of the least of these, ye did it not unto Me."

The motto of the Woman's Institute is **"For Home and Country."** Does this motto not embrace Mother's Pensions? Most assuredly it does! We hear so much now about Reconstruction. Would it not be a good and glorious piece of reconstructive work to stretch out and do something to make the lives of our needy orphans better and brighter, and throw round them the influence that will make them become good citizens—able and willing to help make this Canada of ours a Righteous Nation.

I ask each member of this K.V.W.I. to talk over this subject with your neighbors and friends, talk of it with your husbands and work for it until the Legislature of our Province passes an act to protect the God given rights and privileges of Motherhood.

"I don't think I can go, Jessie, for I just feel wretched"

"OH, I'm so sorry, for I did so want you to be there."

"I hate to disappoint you, dear, but you know how miserable I have been lately."

"Yes, but I thought you were better."

"So I am some days, and then I just seem to be as bad as ever again. I get so weak that I do not feel able to stir."

"What is the trouble ?"

"The doctor says I am anaemic. He says the blood is thin and watery, and I do not get the good of the food I eat. Goodness knows I do not eat much, either, for I have no appetite."

"Why not try Dr. Chase's Nerve Food?"

"Would that help me, do you think?"

"I do not see why it should not. You remember how pale and weak I used to be. Well, it was nothing else than Dr. Chase's Nerve Food that cured me. And I am not looking as though I needed any medicine now, am I?"

"If I could only be strong and healthy like you are, Jessie, I would give anything."

"You never will be unless you try, and I do not think you would be disappointed with Dr. Chase's Nerve Food. It is not only my case, but there are so many other girls we know who have been benefitted by it."

"Will you get me a box at the drug store, Jessie, and I will start right in to-day? If this will only give me an appetite and make the blood rich and red, so that I can get some strength and color, I will be a happy girl."

Dr. Chase's Nerve Food is so gentle in action, and yet so potent as a restorative, that it is a great favorite with women of all ages. It seems to be admirably suited to the needs of their delicate nervous systems, and on this account it has come to be universally used as a means of restoring vigor and energy to a rundown, nervous system. 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto. On every box of the genuine you will find the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author.

Minard's Liniment Co., Limited.

I was very sick with Quinsy and thought I would strangle. I used MINARD'S LINIMENT and it cured me at once. I am never without it now.

Youre gratefully,
MRS. C. D. PRINCE.
Nauwigewauk, Oct. 21st.

THE DOUBLE STANDARD

(By Mrs. Gertrude Eastham Graham, Elmsdale, N. S.)

The present age is one of a vast mental awakening. New ideals, broader views, and more independent thought are causing moral and intellectual revolution.

In no phase of society is this more clearly seen, than in the gradual change of the relation of the sexes.

There has come down to us a terrible injustice, which has had its growth for centuries, namely, the double standard of morals for men and women.

For women is marked out a straight and narrow path, hedged in by conventions, and slavish restrictions. Any deviation from this path, whether great or small, brings its condemnation and punishment from society. If a woman takes one mis-step she becomes an outcast, regardless of the fact that youth, or igorance, or some man's base treachery is responsible. Repentance, and a blameless after life

avail not to change public opinion. Self righteous hypocrites will tell you that when a woman falls, she falls so low that she can never again rise. This is untrue, as any student of human nature wil ltestify. I, myself, have known girls whose youthful purity of mind and soul were sullied; who afterwards became lovely upright women, true lives and mothers. those who meet temptation. But the sin itself they must not condone. And let them require that the father of their children be one who is her equal in moral growth, one whom she can look up to, honor and respect because he has respected himself.

We are told that women know little of temptation, and that if they go astray it is because of some strain of badness in their nature. Would that these complacent moralists could hear the stories that girls and women tell to their fellow sufferers, from men who pursue them until like hunted deer, they fall a prey; or, through some chance escape. And, again, must we evade the fact that a woman's physical temptation, though different from a man's is as strong. Is it man alone, who feels the attraction and stirring of passion through the physical charm of the oposite sex? Ah, no! This is a fact of which we should know more. And right here let me ask, if man boastingly regards women as the weaker sex. how can he expect her to have a stronger will to overcome temptation? For, in addition to struggling against her own nature, a woman must constantly guard and fight against the advances she meets from the majority of men she asosciates with. At this men will be amazed. They will tell you that no woman receives unwelcome attentions that she does not invite, unless it is from some ruffian or moral outcast. But I will say that the average man will protect a woman from every man but himself. And so instead of looking to a man for strength and guidance ,women are taught, through experience to be constantly on guard.

On the other hand, to the male sex has been given freedom of a kind. Man is not held accountable by society in general for sex immorality. He consders that it is his privilege to sow wild oats at will. Women are taught that it is natural for man to give free rein to his passions and they must be forgiven, and made excuses for. Why is this so? Must we believe that the Creator made it impossible for man to be master of himself? Ah, no! We are learning differently. For so long this has been the general opinion and even physicians have counselled young men that the sowing of a few wild oats was necessary for their health, but now we know that chastity is as possible and necessary in man as in woman. Man in general must be led to a higher plane. He must realize that the power of procreation is a wonderful gift, which he must hold in trust, and that the strength of his manhood comes through conserving, and not squandering his sexual powers. It is impossible that a man who has spent years in dissolute living, can make a good husband or father. And then again, another reason why men should live chaste lives. Thousands of babies still-born, or born blind, defective or deformed, ar ethe result of their father's sins.

Thousands of women, pure, innocent and trusting, lose their lives or have their health and happiness ruined, because they contract some loathsome disease, the product of their husband's youthful follies. Could this knowledge be burned into the minds of men and women there would come a cry for equal purity of lives. Women must demand that the men they marry can show as clean a past as they demand from their wives.

,What right has a man to ask of a woman that she be pure and innocent when he has not been?

Thank God, there are enough men, who are strong enough to be master of themselves, to prove that the equal standard of morals is practical and best. Many of these men are doing much to raise the standard of public opinion, but as in the way with all uplift connected with family life, the great burden of responsibility rests with the women.

Mothers must teach their children the beauty and truth of the mysterie of the origin of life. They must teac their boys to reverence women, t respect themselves; they must teac their daughter purity and loftiness o ideals, to be a help and comrade t man, never his tempter. Wome must always be charitable and gent with the sinner, and sympathize wit

SANITONE

is a present-day economy for decorating or re-decorating your home. It comes in many soft and beautiful tones—is easily applied—and will not fade or rub off.

"SANITONE" walls and ceilings may be washed at any time, without affecting the colour.

Our free book, "What, When and How To Paint", will help you to paint right. Write for a copy.

OUR DECORATIVE SERVICE is free. Write us for suggestions and color schemes for the whole house, or any rooms that you plan to do over.

those who meet temptation. But the sin itself they must not condone. And let them require that the father of their children be one who is her equal in moral growth, one whom she can look up to, honor and respect because he has respected himself.

SIMPLY SANDWICHES

The popularity of the sandwich is no longer confined to the picnic season. Its vogue at present is due to the strugggle for simplified meals which are a boon to the overworked housewife and to much-abused digestive organs. It is the substantial sandwich suitable for luncheon or supper that I want to tell you of here.

Of these, perhaps the meat sandwiches lead. They are made of cold boiled or baked ham, roast beef, veal chicken or tongue. They may be varied in a number of ways, from the plain mustard and sliced meat of your childhood to something more inviting by chopping or grinding the meat and combining with parsley, celery, sweet pepper or onion, and moistening with a salad dressing.

Remnants of two meats may often be mixed with good results. Scraps of left-over vegetables give a delightful flavor to most fillers. Cold fried calves' liver makes delicious sandwiches. Chop very fine, season rather highly, add minced onion, a hard boiled egg and dressing enough to spread easily. Serve with lettuce-leaves between thin slices of rye bread and butter.

Egg and Vegetable Fillings

Another rye-bread sandwich which is extra good served with baked beans consists of hot crisp bacon and very thin, freshly made toast. Pressed or jellied meats make pleasing fillers, and often the cheaper cuts of meat can be utilized in this manner with as much success and flavor as the more expensive portions. The cheaper cuts of steak, fried to give the "brown" flavor, ground and seasoned, are very nourishing and palatable.

Next in importance for meal sandwiches are eggs. The common lunch-wagon variety, fried on both sides and served with minced onion, are good when hot. But a better method for home consumption is to scramble the eggs in butter or bacon fryings, allowing one tablespoonful of milk to each egg. Season and cook over a moderate blaze, stirring constantly until creamy. Spread between brown or white bread and serve hot. A bit of finely chopped ham, bacon, or onion adds materialy to this sandwich.

Hard boiled eggs may be combined with finely chopped sweet pepper, seasoned and moistened with mayonnaise. These are extremely good. If the eggs are boiled half an hour they will mash easily wtih a fork or may be put through a potato ricer. Celery or olives could be substituted for the pepper.

Cheese in a New Guise

In fact, hard-boiled eggs combine with almost any of the green vegetables: string beans (cooked, of course) and cucumbers, either pickled or fresh beets, etc., are especially tasteful. Left over vegetables should be made into salads—then spread abundantly between thin bread and butter.

Sandwiches of this sort should be eaten after spreading, as they are juicy and become soggy if they stand too long. Sweet corn, well cooked, chopped sweet peppers, and a hard-boiled egg make a sandwich that is delightful.

There are a number of ways in which cheese can be introduced as a filler for folk who like it. Crumble one hard boiled egg and rub smooth with one tablespoonful of melted butter. Add salt, pepper and a dash of mustard. Mix with one-fourth of a pound of grated cheese and add about one tablespoonful of vinegar, enough for the desired thickness. This filler may be used with either crackers or brown or white bread and is quickly made.

Then there is "Glorified Rabbit" that is splendid on toast, a rarebit sandwich. Melt one tablespoonful of butter, add one-half cupful of cream. When hot, stir in two tablespoonfuls of grated cheese and the same amount of potted ham. This is a most delicious filling.

Nuts as Sandwich Fillers

Nuts in a great variety of combinations make nutritious fillers. Peanuts are perhaps the favorites for ordinary use. Chop very fine, or preferably using a grinder, running them through several times to secure an oily paste. A scant cupful of the shelled nuts make a small jar of the paste. Mix well with a tablespoonful of olive oil or melted butter, a dash of red pepper and a little salt. This is less expensive than the ready made peanut butters, is equally as good and will keep a week in a cool place. English walnuts chopped with celery or olives make nice sandwiches. Pecans and well-cooked prunes chopped and mixed with a good salad dressing have a novel fiavor and make a satisfying meal with milk as a beverage.

If one habitually makes use of left-overs for sandwich fillers, it is a wise plan to keep mayonnaise on hand. There are a good man recipes for dressing of this kind; but here are two tha tare guaranteed to keep indefinitely in a cool place. Beat thoroughly the yolks of three eggs. Add one tablespoonful of sugar, one tablespoonful of vinegar, juice of three lemons, salt and red pepper to taste. Cook until creamy, stirring constantly. This dressing is best with nuts, hard-boiled eggs and fruit combinations.

Another Dressing for Sandwiches

A better one for the meats and vegetables is made as follows: Rub one tabelspoonful of flour with three tablespoonfuls of butter, one teaspoonful of mustard, a little salt and pepper. Add this to the well beaten yolks of three eggs and half cupful of vinegar. Let it boil up once and cook in a double boiler one-half hour. If too thick when ready to use, dilute with cream to the desired consistency.

One beauty about this dressing is that when eggs are scarce, you may use only one, perhaps adding a little more flour, and the dressing is still good for the sandwich fillers.

Considering the subject and the contents of your pantry, many unusual and delicious fillers will naturally occur to you. Things too little in quantity to be served by themselves often spread a number of sandwiches, giving you several different kinds perhaps, and the variety to a table that the modern appetite craves.

There are numerous sweet sandwiches which often do very well as a finish to the meal, but they are better adapted to pink teas than to the hungry man's supper.

It is remarkable how quickly a sandwich meal may be put together, if the dressing has been already prepared. If one is in a hurry, vinegar alone, seasoned with pepper, salt and mustard, gives the desired piquant flavor to a meat or salad sandwich. The hot-fillers may be made in the chafing-dish and served at once. The others are spread in advance and served alone or with a simple vegetable or pudding.

RIGHT ATTITUDE OF MIND

One of the most helpful factors in the harmonious development of mother and child life is a right attitude of mind. It is, of course, most desirable that it be one of contentment and peace; but too often mothers, in addition to the work of housekeeping and the rearing of children, are obliged to contend with problems of sickness and family disagreements. However, if she can meet such situations with intelligence, courage and self-control, she will create a home atmosphere which will be measureless in its influence.

Barrett's
EVERLASTIC
"RUBBER"
ROOFING

You can see the quality of Barrett's Everlastic "Rubber" Roofing as soon as you open the roll.

The best of materials, the utmost skill possible in manufacture, and the experience of over sixty years in making high-grade roofings goes into every roll.

Thousands of rolls of Barrett's Everlastic Roofing have been used by the Canadian and U. S. Governments, the leading railroads, and the largest contractors in the country. Dollar for dollar, it is the best "rubber" value obtainable today.

Don't waste your money on poor roofing that will need to be renewed in a short while. It will pay you better to insist on Barrett's Everlastic and see that you get it. The name Barrett is your guarantee against disappointment. You will find it on every roll of the genuine Barrett Roofings.

TUNGSTEN VS. CARBON LAMP

Although great advance has been made in the electric lamps some people still hold to the old carbon lamp. When it is stated that the tungsten lamp gives more light for at least half of the expenditure of energy some seem to think that that is merely advertising talk for the company who manufactures the lamps. Such is not the case. The ordinary 16-candle power carbon lamp is rated at 60 watts. The 25-watt tungsten lamp gives nearly, if not quite, 20 candle power. Thus, with the carbon lamps one is paying for 3¾ watts per candle power, while with the tungsten lamp of 20 candle power only uses 1.25 watts.

LOST OPPORTUNITY

The energetic newspaper reporters on the presidential peace ship have missed one valuable piece of news. They have made no mention of the president being seasick or what he threw up if he was sick. This would have been real news for never have we read of a president being sick enough to cast up acounts. Think with what consternation the world would have seized upon flaring headlines saying: "President Wilson Gives Up Ham," or "Troubles Within Worry Wilson," or again "President Royally Banquets Father Neptune." Here indeed American journalism has been caught sleeping at the post.—Johnstown Breeze.

FAKE GRAIN VARIETIES

(Experimental Farms Note.)

Each year many farmers are the victims of plausible agents who are selling so called new varieties. Making extravagant claims they charge a corresponding price and only too often the farmer who naturally desires more productive varieties if obtainable, pays an exorbitant price for a supposedly new and prolific sort, which is either an old variety camouflaged with a new name or else a selection whose qualities are entirely unknown. Being divisible into classes, these agents and their claims can be grouped conveniently as follows:

FIRST, those who take a high yielding, prolific variety such as Banner or O.A.C. No. 72 oats, give it another name and introduce it as a new variety.

SECOND, those who are selling a variety that has been multiplied from a peculiar plant or from extraordinary heads found in the general crop. The producer thinking it a valuable variety, offers it for sale before its qualities are known.

THIRD, those who are offering for sale to a few limited customers only, a wonderful variety that was produced by a secret process of selection or else has been grown from a few seeds found in th tombs of the ancient Pharaohs.

A fourth class might be made of those who sell a variety for what it is, but make extravagant claims for its yielding ability. This is well illustrated by the Alaska or seven-headed wheat.

The agent in the first case is a financial shark who is obtaining money by false pretences. He perhaps does the least harm of any beyond the confusion created in the nomenclature of varieties and the money which he takes from the farmer.

In the second case the agent may be acting in the best of faith and with the conviction that his claims will be justified by the resulting crop. Perhaps they will be, but the varieties are legion that have been introduced in this way and have been found worthless in comparative tests with standard varieties.

The third agent though, is the real out and out grain fakir and should be liable to prosecution. The farmer who is deceived by his pretences almost deserves to pay the price of his credulity.

It is the right of any person who has multiplied out a selction of grain to sell it for what it is and charge any price he sees fit. Against these well-intentioned, legitimate transactions we have nothing to say beyond warning the farmer, that at the best he is likely only buying an old variety and that exceedingly few of these amateur selection are ever of value.

What is advisable is that in every

Auction Sale of Dairy Cattle!

Owing to illness I am obliged to dispose of my dairy herd of Pure Bred and Grade Holsteins at my farm,

Coxheath, Cape Breton, May 14th, 1919.

At 1 P. M.

10 head Pure Bred Holsteins, 3 Mature Cows, 1 three year old heifer, and 6 heifers in calf, 2 will calf shortly, other 4 in calf about two months.

16 mature Grade Holstein Cows and 3 Mature Grade Jersey Cows, the greater part to calve during August and September, and 3 Grade Holstein heifers, safe in calf. This herd is without doubt the finest in Eastern Nova Scotia, if not in the Province.

Also Empire Milking Machine, consisting of 2 double units, complete with Gasoline Engine; also 1000 lb. Empire Separator, only used one month.

TERMS—Cash, or 1, 3 or 6 months approved joint notes with interest at 7%.

Beauty, Fire-resistance, Economy combined in this Roofing

MANY costly homes have been roofed with Brantford Asphalt Slates. Architects select these slates because of the artistic beauty of the soft, harmonius shades of reddish-brown and dark green, which are the natural, unfadeable colors of the slates.

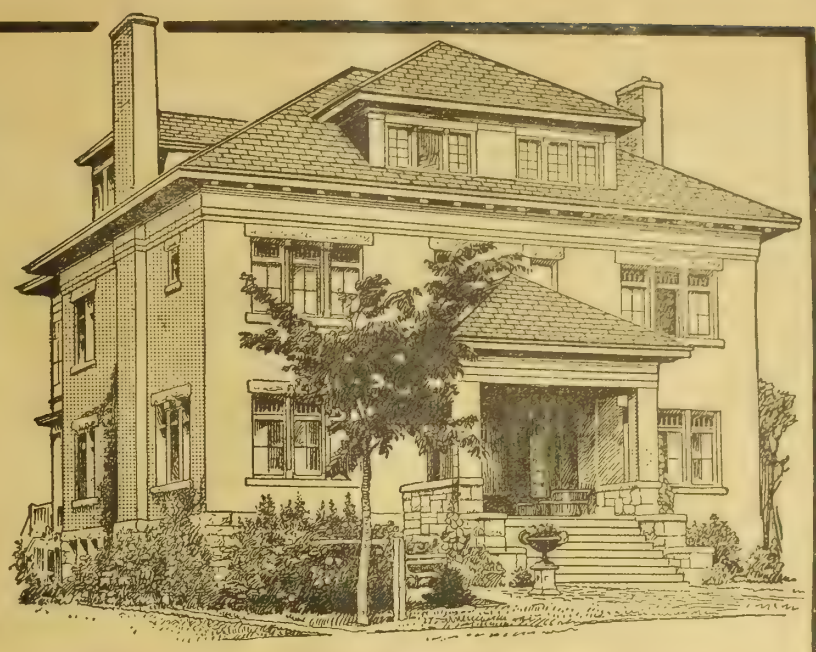
Brantford Asphalt Slates

are made from a special grade of long-fibered felt which is exceedingly absorbent, so that it will take a very heavy and thorough saturation and coating of asphalt and on top of that a surface of crushed slate. The slate is rolled into the asphalt while the asphalt is hot and becomes part and parcel of the roofing. It cannot be washed off, blown off, or even kicked off by the the heel unless you use force enough to tear part of the asphalt with it.

The regular Brantford Asphalt Roll Roofing has been on roofs for many long years and shows little or no signs of wear. Brantford Asphalt Slates have the additional slate surface and are that much heavier. They are also laid to overlap, adding still further to the wear-resistance of a roof. It seems reasonable to expect that they will last almost as long as the walls.

Non-absorbent—Do not get watersoaked

Asphalt is one of the most waterproof materials known, and Brantford Asphalt Slates being non-absorbent, do not get watersoaked and rot. Neither do they crack, break or fall off. In fact, they possess one great advantage over any other form of roofing material:— they cement together under the heat of the sun shortly after



Home in Kingston roofed with Brantford Asphalt Slates

they are laid, resulting in a solid pavement-surface on the roof under which rain or snow cannot drive and no individual slates become loose or blow off.

Brantford Asphalt Slates are wonderfully fire-resistant and are approved by the fire insurance companies, being put into the non-combustible class. Flying embers from burning buildings, sparks from threshing engines or railroad locomotives die out on Brantford Asphalt Slates. If a fire should start in an interior of a building roofed with them, the slates act as a blanket and retard the spread of the fire.

Brantford Asphalt Slates are moderate in cost, and are very rapidly laid because they are regular in size and pliable. They can be laid over ridges or curved surfaces, and every one is perfect. No knots or worm holes to look out for. No care required to avoid splitting them when nailing. And you can reroof an old building with Brantford Asphalt Slates without any extra bracing being required.

Send for illustrated booklet

Our booklet "Permanent Roofing Satisfaction" and a sample "slate" will be mailed on request. Both are worth getting if you are going to do any roofing this season

Brantford Asphalt Slates are suitable for country homes, city homes, golf clubs, churches, garages, barns or any kind of a pitch roof where an artistic effect is desired.

case before buying a variety that he intends to grow as a general crop, the farmer should consult the reports of his nearest Experimental Station. The remedy for the actual frauds that are perpetrated is in his own hands. As long as he will buy the agents will sell, and the efforts put forth by the cereal stations of Canada for the improvement of crops will contine to be partially frustrated.

HORSE BREEDING

Horse breeding in Nova Scotia has experienced a decided lull during the past two years. Notwithstanding this fact many farmers having horses to sell cannot find buyers. On the other hand dealers have brought in many car-loads and have found a quick-market at top prices. These dealers are buying in Ontario and Quebec. They are able to get the types which command a ready sale because farmers in these provinces are using pure bred registered stallions. In Nova Scotia the use of such is on the increase but even yet fully 75% of the stallions used in Nova Scotia belong to what is techinically known as the "scrub" class. No further argument would seem necessary to convince every farmer that it is well worth while to pay the extra cost and travel the extra distance to reach a pure bred horse.

The N. S. law in respect to the enrollment of stallions was passed for the purpose of putting a premium on this class. Under the law every stalion in Nova Scotia must be enrolled with the Dept. of Agricultue. Unless he is so enrolled no charges made for service are recoverable by legal action. Enrolment is now taking place, and later on inspectors will be sent to various parts of the Province, where violation of the Act will be dealt with. It is the general opinion among those who know the business that the present year should see a big increase in the breeding of mares to the best that can be reached.

BOSTON BUYING N. S. POTATOES

For a time it looked as if Nova Scotia farmers would have large quantities of last years' crop of potatoes left on their hands. Fortunately for us, the expected shortage in the Boston market has taken place, and Boston buyers during the past few weeks have purcahsed many cars at fair prices. It is understood that the shortage there is sufficient to take care of all are good marketable potatoes left in the Province.

The clean up should stimulat considerably more cropping than was planned for a month ago, especially in view of U. S. Food Controller Hoover's prediction that wheat will be higher than ever next fall. There is plenty of feritilizer in the country for all the increased production that can be attempted. Until recently sales of fertilizer were somewhat below the mark, but with the approach of the planting season the demand has sharpened. The fact is that there is absolutely no fear of over-production in any of the great food commodities this year.

INSPECTING THE FORD IGNITION SYSTEM

The sugegstions here given comprise the most important points in an inspection, such as should occasionally be made, of the battery and coil system in use on Ford cars. See that the four flexible conductors connecting to the timer are tightly clamped under their binding screws and that none of them have become partially broken by the movement of timing the spark. If any of them are particularly limp, at some one point, a break may soon be expected there if they are badly oil soaked, insulation and the contact segments have worn badly out of true, missing will result. The spring which holds the roller in contact should be sufficiently strong and the whole timer should be kept clean and well lubricated with light oil. The timer case should be firm and not "wobbly" on its bearing. Remove the coil box cover and, with the engine running, see if any of the vibrators spark noticeably. If they do, there is something wrong. Examine the contact points and see if any are badly blackened or burned so they do not make a full, flat contact. If so, they should be dressed down with a jeweler's file until they are smooth and well fitted. Be sure that the points of each vibrator are left the correct distance apart, about 1-32 inch, as too wide separation may result in hard starting. This is adjusted by maens of the thumb screw. Should any particular coil unit have given repeated trouble, have it tested at the service station. Remove the magneto contact spring, by detaching the screws that hold in place its binding post in the top of the flywheel casing and make sure that no dirt has collected under it, that may break the connection. Remove the magneto contact spring, by detaching the screws that hold in place its binding post in the top of the flywheel casing and make sure that no dirt has collected under it, that may break the connection. Remove the plugs, clean their porcelains with a brush wet in gasoline and set the gaps between the points at 1-32 inch. Replace them in the cylinders and squirt a little oil around the seat of each and also between the porcelain and the packing nut. Start the engine and, if gas bubbles through this oil, try new gaskets under the shells of any that leak and tighten the packing nut or put in new packing washers where there are leaks around the cores. See that the plug cable terminals cannot jar loose and that the cables are not rubbing against the cylinders or crossed with others, also try for tightness all binding screws at the coil box switch and elsewhere.

NOISY VALVE GEAR

X. writes: The tappets of my four cylinder engine are very noisy and,

if they are adjusted very tightly, the engine will not pull. The valves are not of the overhead type. How can I get the noise out of them?

Answer: We are at a disadvantage in not knowing the kind of valve action in question, and can offer the following suggestion only: Be sure that the surfaces that strike together, to cause opening, are perfectly flat and true. If they are not, have them made so. In case the valve stems have worn loose in their guides, you need new guide bushings or valves with oversize stems fitted to the old guides, reamed out. If the push rods are too loose in their guides this looseness should be corrected or you will stil lhave noise from the "side slap." Sometimes, little ferrules, made out of vulcanized fibre, are fitted over the valve stem ends, so that the push rod strikes the less resonant fibre instead of metal. When you adjust the valves too closely, you doubtless cause them to hold open, when they should be closed, and loss of power necessarily results.

SHELLED GLASS

C. F| McD.: My old car carries a folding windshield and, when it is up, there is no space to look through between the section, as in recent shields, so that, in wet weather, driving bcomes very difficult and unsafe. What is the best way out of this difficulty?

Answer: Some drivers have overcome this trouble by taking the shield to a glazier and having a round hole cut out of the glass in such a part thereof as to enable the operator com-

fortably to see the road through it from his regular position at the wheel. Before taking down the shield the best place for the hole should be marked. It need not be so large as to let in a great deal of rain or cold air—a comparatively small aperature giving the driver a pretty good range of vision. Cutting the hole, without cracking the glass and grinding its edges smooth. is quite a delicate job, but a good glazier can do it successfully.

THE SMALL CAR AND HIGH SPEED

Very fact driving is always excessively expensive as compared with driving at moderate speeds. If a person habitually works himself to the limit or in other ways "lives fast," his health and longlevity are thereby sacrificed and it is the same with a motor car. It is creditably stated that the tires on a car, driven at an average of fifteen miles per hour, give twice the mileage of those on a car drivn at thirty miles per hour average speed. Overcoming the extreme air and road resistance and the high internal engine losses incident to very high speed makes excessive inroads upon fuel and oil supplies. The increased expense for repairs is, however, the heaviest penalty imposd for indulgence in exorbitant speed, not

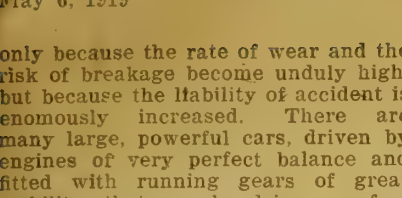
only because the rate of wear and the risk of breakage become unduly high, but because the liability of accident is enomously increased. There are many large, powerful cars, driven by engines of very perfect balance and fitted with running gears of great stability, that can be driven as fast as even an extreme devotee cares to drive, without any lack of controllibility or signs of distress upon the part of the power plant. Such cars are designed for high speed operation and, while the law of the costliness of high sped inevitably applies to them, operating them very fast is not unreasonably injudicious. Indeed, the possible speed of such cars is so high that they are seldom driven nearly to the limit of their capacity. There are, on the other hand, a vast number of small cars, with four sylinder engines of rather crude balance, geared very low and with small wheels and running gears of only moderate stability. Such cars when driven at two-thirds the speed at which a big car can pervibration. Such a car is not intended for high speed use and will prove extremely costly to maintain if used in this way. No piece of machinery operated at its limit of performance long proves satisfactory. If one must drive furiously one should use a big car, having surplus speed capacity, and not push a little car to early destruction.

CLUTCH DISKS STUCK IN ENGAGEMENT

G. W. D. writes: I have just been trying to put my car into service, after keeping it laid up during the winter, but find that the clutch will not throw out although I push as hard upon the pedal as I dare to. What shall I do?

Answer: We imagine that your clutch must be of the disc type and that the plates have remained pressed together so long that their surfaces

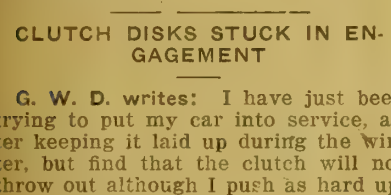


have adhered rather strongly. If this is a lubricated metal disc clutch, kerosene squirted in among the discs will probably free them, but if the discs are asbestos faced and intended to operat dry, this treatment would be inadvisable. You might jack up a rear wheel, throw the gears into high, start the engine push on the clutch pedal strongly and gently apply the foot brake. This ought to cause the discs to separate. If you can get at them, you might try prying them apart with a broad screwdriver, while someone pushes on the clutch pedal. Next time you lay up your car, you better leave the clutch disengaged by fitting a stick, cut to the correct length, between the pedal and the heel board, and thus avoid a repitition of this trouble.

COAL OIL FOR CARBON

J. P. asks: (1) Is coal oil good to use to clean out an engine? (2) Is a cut out of any benefit and in what way?

Answer: (1) It used to be thought valuable for removing carbon, but is



little used now. However, it has some effect, if used frequently and it does keep the piston rings from gumming in their grooves. You will get better results by using some well known brand of carbon remover, following directions carefully. Even water, drawn through the carbuetor air-intake, tends to loosen carbon. (2) Some people consider a cut out useful in detecting cylinders that miss fire, for, when it is open, each explosion can be heard distinctly and a "miss" is readily apparent to the ear Unless a car has a badly clogged or altogether too small a muffler, opening the cut out will not afford appreciably increased power, although motorists often imagine that it does. Manufacturers no longer put on cut outs, their use is contrary to law in many places and is an annoyance to the public which no considerate driver should be guilty of making.

The farmer who wishes to invest money in his farm can find no better place to invest it than in tile drains. There are few farms adequately drained. Tile underdrains will improve the productive capacity of lands that do not show an urgent need of draining. There is a good opoprtunity to make the farm more profitable by investing some capital in tile drains.

Has Imitators But No Competitors.

Safe, Speedy and Positive Cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites. Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Toronto, Ont.

THE FORMATION OF HUMUS IN SOIL

The word "humus" is rather loosely used in many quarters to indicate organic matter icorporated in the soil. Strictly speaking, however, humus is one of the products of decay— formed when organic matter undergoes dissolution underground. Yet it is no definite, well-defined chemical substance, like starch or sugar, but rather a mixture of many substances. Consequently, it is no very definite chemical composition though it possesses certain properties which it exercises in a very definite way. Organic matter when left undisturbed to undergo complete dissolution breaks down into simpler and simpler chemical compounds until finally there is nothing left. Theoretically, the final stage should be the breaking up of these simple substances into carbon dioxide, a gas which dissipates in the air, hydrogen gas, which also escapes in the same way, and water. Carried on to its conclusion, as indicated, there should be nothing left save gases and water vapor—all of them lost in the atmosphere.

Practically, however, under conditions prevailing in the soil, much of the dissolution spoken of stops short of these final steps. This due, probablp to the fact that insufficient oxygen—in the form of air—is present to permit the last stage, represented by complete oxidation, to be carried out. Thus there are left many chemical substances all of which represent more or less final products of decay, but which stop, noene the less, this side of actual dissolution. Some of these are acids, some are fats, others are organic substances of varying chemical formulae. Together, these form a blackish compound which when thoroughly dry forms a hard, shiny ebony-like mass which, properlp speaking, is humus.

Though humus is thus a complex mixture of organic substances it behaves itself as one possessing quite distinctive traits. For one thing it is fairly resistant to further dissolution; that is, it does not disintegrate rapidly, thus permitting the amount of it to be appreciably increased from year to year. For another thing it has a strong power to hold or detain soil water—not the surplus drainage water however, but the "film water" which surrounds each particle of soil when good tilth prevails. Again, its black color increases the heat-absorbing power of soil that seen germination and plant growth are hastened. These physical influences, however, are not the only advantages which the formation of humus brings to a soil. It should be remembered that during the whole process of the disintegration of the organic matter in question, plant food is being made available through one means or another. Furthermore, the presence of this organic matter lightens the soil and promotes bacterial action. Thus the term "humus" always sugiests to us several most desirable features closely allied with soil improvement.—S. C. B.

THE DAIRY HERD AT FRESHENING TIME

The condition of the dairy cow at and after calving has a great influence on the success of her ensuing lactation period. It is important that the cow or heifer should be in good flesh at calviny time, as she then has a store of energy both muscular and nervous, which will be a great aid to her during the lactation period. It is also a well established fact thta the more flesh a cow is carrying at freshening time the higher the percentage of fat in her milk. Thus it will be seen that it is very important that she be well fed for a period before freshening. To have her in the best shape it is advisable that she should be dry for a short period each year; about six weeks is sufficient if she is being well fed.

As calving time approaches she should be fed almost the same as the milking herd with a supply of laxative meal such as bran, oil cake, roots, etc., increasing the bran as she nears the freshening day and decreasing the heavier meal. If the cow is on good pasture practically no extra feed will be required before she freshens. One of the chief causes for garget and inflamed udder, in dairy cows is due to faulty feeding at this period. When fed the same heavy ration as the milking cows, udder trouble is sure to result. This can be prevented by feeding more lavative food such as wheat, bran and oil cake. A dose of one and a half pounds of Epsom salts and one ounce of ginger should be given before calving. This will put the cow in the best of calving condition. It is always better to have the cow freshen in a box stall, as she has much more freedom and room than if tied in a narrow stall. The calf should be left with the cow for a day or two, as this tends to remove any inflammation from the cow's udder and start the calf off to the best advantage. The cow should not be milked out dry for the first four days, as there is always a danger of milk fever setting in. If the afterbirth be retained it should be removed by a competent person within 48 hours after calving. Although this is a simple operation, it should be done carefully and thoroughly, so as to prevent bleeding and to entirely remove all particles from the extreme forward part of the uterus. After the afterbirth is removed, the uterus should be flushed out with a solution of boracic acid and water or oxalic acid solution.

After three or four days the cow may be reduced to normal milking periods and the feed gradually increased until in about 10 days she is on normal rations. It is well, however, not to feed much barley or cotton seed meal for at least two weeks because of their heating effect upon the animal and tendency to cause constipation and udder trouble.

STOCK NOTES

The Welsford Yorkshire Breeders Club whose adv. appears in this issue, are offering some of the best young boars and sows that are for sale in the Maritime Provinces today. The dams of these are mostly sows that were bred on the Farmers Advocate Farm in Ontario and were secured at a larg price for the members of the Club.

Anyone wishing an ideal type of bacon hog should write the Secretary, Geo. M. Lyon, for description and prices at as early a date as possible as they are being eagerly sought after by all who have seen them.

Just Plain Common Sense

A little while ago a friend remarked: "The longer I live and the more experience I gain the more am I impressed that the rarest kind of sense is commonsense." It is nevertheless just this plain commonsense upon which our simple plan for Systematic Saving is based. Simple and effective, it has by giving a full interest return, materially increased the savings of those who have favored us with their accounts.

For instance, a saving of $50 a month will amount, with interest at 3%, to $609.54 at the end of a year, while at 6% the total would be $619.52.

Don't you consider this additional $9.98 worth while? We do, and that is the basic reason for our plan by which anyone may save at a full rate of interest.

We wish to be of service to you too. Send your name and address and you will receive by return our Systematic Investment Plan.

Long-Wearing

Stylish, Well-Made

Top –Ideal wet weather shoe. Gunmetal calf. leather lined; Goodyear welted; viscolized soles.

Centre –For rough wear. All solid leather, bark-tanned; waterproof grain. None better made.

Bottom–Chocolate colored viscolized calf sporting boot; Goodyear welted. Wellmade and comfortable.

Shoes

SYMPTOMS OF ILLNESS IN COW

How many valuable dairy cows are lost simply because their owners do not pay attention to the first indications of illness in the animal, and take prompt steps to have the trouble checked rather than waiting until the trouble becomes obviously serious before calling in the veterinarian?

There are a number of general symptome which accompany a great many of the commoner bovine diseases which are not difficult to recognize, and which, if nothing else, will be an indication that the animal is not normal and probably requires veterinary attention.

Probably the most important symptom of ill health in the animal is a rise in her temperature. The normal temperature of the cow is from 98 to 100 degrees, though there are some animals in which it may run even higher. As a general principle in heifers or young cows the normal temperature is likely to be higher than in older animals. A self-registering veterinary thermometer is an instrument which should form a part of every dairyman's equipment. In taking the temperature it is necessary to place the thermometer in the rectum of the cow for from three to five minutes. To be on the safe side it should be made a rule that any rise of temperature above normal be regarded as suspicious.

Along with temperature, the pulse of the animal should be taken. The best place to get this is at the angle of the lower jaw, where it may be plainly felt.

The normal pulse of human being is around 72 beats per minutte but that of the cow is much lower, being between 50 to 60 beats to the minute. In case the pulse count is higher or considerably lower than these numbers the condition of the cow is not normal.

Another very important guide in diagnosing trouble in an animal is the respiration. The normal respiration of a healthy cow is from 15 to 20 times a minute—just about the same as that of a human. If a cow breathes much slower or much faster than the normal rate, it is almost certain there is something wrong. Other signs to be watched for are lack of appetite, sudden shrinkage of milk, and the ceasing of chewing the cud.

When the cow is found to be ailing the first thing to do is to get her out of the herd and place her in comfortable quarters where she will not be near any cattle. Where there is the slightest suspicion of any contagious disease this removal of the cow from the herd should be done at the earliest possible moment. Her milk should not of course be used as it would be unwholesome and where a cow has been atacked by certain diseases such as tuberculosis it would be actually dangerous to use her milk.

While in most cases it is best to leave the "doctoring" of cows to a capable veterinarian there are cerain simple remedies that should be kept in every dairy barn. These remedies should be placed in bottles or packages and plainly labelled and kept in a tight box with a strong lid. Some of the drugs that are useful are boracic acid, vaseline, epsom salts, raw linseed oil, sulphur, spirits of turpentine and salt peter. There are a number of good books that treat on different diseases of cattle and other stock and at least two or three of these should be found in the home of every dairyman, as by their use the owner may often be able to relieve a sick animal and save the expenses of a veterinarian. When, however, a valuable animal gets sick and the owner feels that he can do little or nothing to give relief he should take into consideration the amount of the investment and get a veterinarian to the barn as soon as possible. In some places it is almost impossible to get a good veterinarian within a reasonable distance but when he is needed a good ma nseveral miles away is worth al he charges.

PLANTING ROOTS FOR SEED

(Experimental Farms Note.)

As the time for plonting mangels, turnips and carrots for seed is at hand, a few recommendations relative to planting may be opportune.

In the first place, any one who has save some roots for the purpose of raising from them what seed he will need for next year's seeding, should use only the very best roots. It is of course evident that, if the most satisfactory results are to be obtained, the roots to be used for seed proruction must be perfectly sound; otherwise the seed grower runs the risk of going to the trouble of planting only to find that after a while the stand of the seed crop becomes thin and disreputable lokoing as the diseased roots rot in the ground.

The roots used for seed production should furthermore be as uniform as possible in respect to general type. That is to say, they should be of the same color and of the same general shape. It is of minor importance that they be uniform in size as experience has shown that small roots produce about as much seed as large ones and that the quality of the seed produced by small roots is just as good as the quality of seed produced by large ones.

The roots chosen for seed raising should be planted in rows anywhere from 2½ to 3 feet apart so as to make it possible to horse-cultivate between the rows. Mangels and swede turnips should, in order to be given a chance to branch out freely, be spaced anywhere from two to three feet apart in the rows; in the case of carrots, the roots may be planted closer together, say from 1½ to 2 feet apart in the rows.

If only a small number of roots are to be set out, the planting may be done with a spade. This method of planting is very simple. Holes are made at the proper distances sufficiently deep to allow the roots placed therein to be just nicely covered with earth. When the roots are placed in the holes, the soil should be packed around them. The planting is done properly if the tops of the roots are just a little below the surface of the ground.

If a large area is to be planted ,it is, especially if help is scarce, more economical to plant with a plow. Furrows are made, and the roots are placed reclining on the slanting side of the furrow at the proper distance apart in such a way that the soil turned over by the plow in the next round will cover the tops. Then a third furrow is plowed and no roots are planted in it. To be brief, the roots should be planted in every third furrow and placed in such a manner that the plow barely covers them with soil. If the tops are left uncovered, they may dry out if the weather turns hot but if, on the other hand, the roots are buried too deep, the seed stalks sprouting from them may have some diffivultp to break through, especially if the roots are small.

No matter what methods are followed in the planting of the roots, it is essential that the roots be set out as early as it is possible to go on the land for, according to experience, the early planting brings the heavies seed yields.

SIRES DETERMINE SUCCESS OF OF ANY LIVESTOCK INDUSTRY

The farmers of the Maritime Provinces should look well to the sires they purchase. Dairy sires sould not be bought on the records of their dams or daughters. Low-producing cows should not be considered at any price, and they are invariably the result of poor sires.

Our horse markets are flooded with small inferior horses, the get of poor sires. At the country sales common horses sell for about $80 a head, while the heavy horse, weighing 1500 pounds or above, sells for $200 or more. Better, heavier sires get the better grade of horses.
